SUBJ: Anadromous waters nomination DATE: 12/18/91

This nomination includes "wetlands" surrounding the lake depicted on the map. The wetlands, at the time of sampling (October 8, 1991), were inundated with 6 to 8 inches of water and were contiguous with the lake (i.e. below the ordinary high water line of the lake). The USGS map shows only the deepest part of the lake, not the shallow shoreline areas. The shallow shoreline areas are shown on the USGS as wetlands, even though the area is covered with 6 - 8 inches of water.

One trap was set for three hours in the shallow areas with emergent vegetation and 15 coho salmon fry were captured. In order to accurately depict the sampled limits of anadromous fish rearing habitat, a polygon should be drawn around the wetland area as indicated on the nomination form attachment.
