IMPORTANT: Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

Comments: We observed juvenile coho salmon rearing in about five pools on a tributary of Quadra Creek on Montague Island.

At each pool we crouched down so we could get a good view of the fish. We looked at the shape of the anal fin and looked for the white edge of the anal fin to positively identify the fish as juvenile coho salmon. General coloration, parr marks, body shape, and size were consistent with juvenile coho salmon. All of the observers have many months or years of experience handling juvenile coho salmon at weirs, during growth studies, or other projects, so the they knew what juvenile coho salmon look like. We did not capture any fish or have them "in hand," but since Dave Ryland asked us to look for the fish, we took sufficient time to make positive identifications.

We did not look on the main stem of Quadra Creek, due to the lack of time and the weather.

Name of Observer (please print): Ken Hodges, Fisheries Biologist USDA Forest Service
