Note: Locations were determined by plotting lat/long for each fish detected during aeiral survey flights. In the typical situation where a fish was detected on multiple occasions during the flight (i.e. different locations) the location corresponding to the maximum signal strenght was plotted. Location names were determined using a combination of ArcGIS, Garmin Map, and quarter-quads. The entire Kuskokwim drainage above Aniak was flown extensively in October with the exception of the upper Holitna, upper Aniak, and a few small mainstem tributaries. These portions of the drainage that were not covered in October were flown in November. In the situation that a fish was detected in both the October and November surveys (n=48) the most upstream location was selected as the best estimate of upstream destination. In the situation were a fish was located in the mainstem during one survey event and in a tributary in the other, the tributary location was used, unless signal strenght dictated otherwise. **This table only represents best estimates of final upstream location for the purpose of mapping and FINAL distribution summaries(i.e. Green cells). Yellow cells represent new fish located during the November flight.**
