Drafted FI 12/4/89 Date

Species	Date(s) Observed	Spawning	Rearing	Migration
Pink Salmon	8/19/89	X		X

Comments: Provide any clarifying information, including number of fish observed, location of fish survey data, etc.

In the north~~east~~west corner of Taroka Arm is a small intermittent clearwater stream flowing into the lagoon. On May 26, this stream disappeared into the gravel. There is a small falls (barrier?) about 25 yards upstream. We counted 60 pink salmon in the stream and 240 more in selected locations in the lagoon, indicating possible intertidal or shoreline spawning.

Attach a copy of a map showing location of mouth and upper points of each species, specific stream reaches identified for spawning or rearing, locations of barriers, such as falls. Attach a copy of the fish survey data, if available.

Stopped for lunch - Helo w/ DEC crew

tributary in the NE corner of Tarvka Bay. We had stopped here last trip (at low tide). It was high tide this time. There were 3-5,000 Pinks and 25 Sockeye. There is a barrier falls 25 yds upstream so all the spawning must be intertidal. Some oil was found here by survey crews earlier. One of the few sites with a mud bottom. There was oil also reported and still there on the gravel beaches to the SE. These fish were not paired up

Next stop the tributary lagoon at the NW corner. This stream did not disappear into the gravel this time. However there was a small barrier (??) falls about 25 yds upstream of this small stream. Pinks were seen in the stream (60) and several places within the lagoon (240) - Again this is mostly intertidal. Only the actual stream would not be.

Then went to a small trib ¾ mile South. There is a gravel bar blocking the channel except at high tide
