I Ket

Clover Lake of 187 acres lies on Prince of Wales Island between Cholmondeley Sound and Skowl Arm of Kasaan Bay at an elevation of 1388 ft. The drainage area of this lake is only 621 acres and from alpine-type country. The water has considerable muskeg stain but the lake is quite deep (est. well over 100 ft.). There are falls in the lake outlet which prevent entry of fish via this route. It was planted with 18,000 eyed steelhead eggs in 1956. Hardness and acidity have not been checked but similar waters have up to 15 ppm of calcium hardness and pH of 6.0. The only notable spawning grounds available to the fish are in the outlet above the barrier falls and seepages off the mouths of the small intermittent tributaries.

The lake was netted for 6 net days and produced four rainbow trout. These were 8.5 to 19 inches long and ages 1 to 6 annuli were noted on the scales. The largest had 3 spawn checks. The lake receives some use by hunters who also fish. Access is by float-plane. Catches have been consistent but not great.
