SUPPLEMENTAL DATA

NAME Point Lone Lake

LOCATION W. side of [illegible]
Inland from Point [illegible]

Additional Data

Tributary 1 (N): empties into a large gravel delta. Delta well suited for a complete camp site. The gravel delta is bordered by spruce and alder with abundant skunk cabbage. No aquatic vegetation noted in the stream. Bottom composed of fine gravel and sand.

Tributary 2 (NE): is the largest of the three. Flows onto gravel delta into lake proper from its mountain side origin. Stream is 1½ - 3 feet deep and muddy stained in color. Stream bed composed of fine to coarse grade gravel and suited for spawning use. Abundant undercut banks and pools well suited for rearing salmonids. Large schools of small fry observed but proved too small for minnow traps sampling. A school of 30-40 large Dolly Varden were observed at the edge of the gravel delta. Good biting on lures. Caught 15 Dolly Varden in two hours (c/e 7.5) and all released unharmed.

Tributary 3 (E): is located close to tributary two although smaller. Other characteristics are very similar.

Set variable mesh gillnet only momentarily and gilled two male sockeye and one cutthroat. The net was pulled early to prevent drainage to it by sockeye. Net site marked on study map.

The team observed 100-120 mature pinksalmon schooled in the lake's outlet stream. This system is thought to support a steelhead population however, this could not be verified by the study team.

SUPPLEMENTAL DATA

NAME Ford Arm Lake

LOCATION

Recreational Analysis Summary

Accessibility:

Recommended mode of transportation to Ford Arm Lake is by aircraft. It is possible by large boat which would have to be anchored in Ford Arm and the angler would have to hike up the outlet stream to reach the lake itself. The lake is of sufficient size to permit a loaded beaver aircraft to land and takeoff with a good margin of safety.

Fishability:

The lake is somewhat difficult to fish from the lake shore and a small boat, preferably inflatable for convenience, is easier to fish from. Shallow areas are located in the mouth of tributary streams. The lake's shore is moderately steep overall and the lake is very deep. Shoreline vegetation is somewhat dense making movement a little difficult.

Esthetics:

Ford Arm is in a very beautiful and scenic valley created by past glacial action. The lake is surrounded by moderately steep hillside and mountains.

Relationship to other recreation areas:

Ford Arm Lake is at the head of the Ford Arm area and a part of the West Chichagof drainage. Although the W. Chichagof area is generall underutilized by sportsmen it represents considerable potential. Not as a developed area but rest/ained in its wild state as a fly-in or pack-in lake.
