## Symbols and Abbreviations

The following symbols and abbreviations, and others approved for the Système International d'Unités (SI), are used in Division of Sport Fish Fishery Manuscripts, Fishery Data Series Reports, Fishery Management Reports, and Special Publications without definition. All others must be defined in the text at first mention, as well as in the titles or footnotes of tables and in figures or figure captions.

<b>Weights and measures (metric)</b>		<b>General</b>		<b>Mathematics, statistics, fisheries</b>	
centimeter	cm	All commonly accepted abbreviations.	e.g., Mr., Mrs., a.m., p.m., etc.	alternate hypothesis	$H_A$
deciliter	dL	All commonly accepted professional titles.	e.g., Dr., Ph.D., R.N., etc.	base of natural logarithm	e
gram	g	and	&	catch per unit effort	CPUE
hectare	ha	at	@	coefficient of variation	CV
kilogram	kg	Compass directions:		common test statistics	F, t, $\chi^2$ , etc.
kilometer	km	east	E	confidence interval	C.I.
liter	L	north	N	correlation coefficient	R (multiple)
meter	m	south	S	correlation coefficient	r (simple)
metric ton	mt	west	W	covariance	cov
milliliter	ml	Copyright	©	degree (angular or temperature)	°
millimeter	mm	Corporate suffixes:		degrees of freedom	df
<b>Weights and measures (English)</b>		Company	Co.	divided by	÷ or / (in equations)
cubic feet per second	ft <sup>3</sup> /s	Corporation	Corp.	equals	=
foot	ft	Incorporated	Inc.	expected value	E
gallon	gal	Limited	Ltd.	fork length	FL
inch	in	et alii (and other people)	et al.	greater than	>
mile	mi	et cetera (and so forth)	etc.	greater than or equal to	≥
ounce	oz	exempli gratia (for example)	e.g.,	harvest per unit effort	HPUE
pound	lb	id est (that is)	i.e.,	less than	<
quart	qt	latitude or longitude	lat. or long.	less than or equal to	≤
yard	yd	monetary symbols (U.S.)	\$, ¢	logarithm (natural)	ln
Spell out acre and ton.		months (tables and figures): first three letters	Jan, ..., Dec	logarithm (base 10)	log
<b>Time and temperature</b>		number (before a number)	# (e.g., #10)	logarithm (specify base)	log <sub>2</sub> , etc.
day	d	pounds (after a number)	# (e.g., 10#)	mid-eye-to-fork	MEF
degrees Celsius	°C	registered trademark	®	minute (angular)	'
degrees Fahrenheit	°F	trademark	™	multiplied by	x
hour (spell out for 24-hour clock)	h	United States (adjective)	U.S.	not significant	NS
minute	min	United States of America (noun)	USA	null hypothesis	$H_0$
second	s	U.S. state and District of Columbia abbreviations	use two-letter abbreviations (e.g., AK, DC)	percent	%
Spell out year, month, and week.				probability	P
<b>Physics and chemistry</b>				probability of a type I error (rejection of the null hypothesis when true)	$\alpha$
all atomic symbols				probability of a type II error (acceptance of the null hypothesis when false)	$\beta$
alternating current	AC			second (angular)	"
ampere	A			standard deviation	SD
calorie	cal			standard error	SE
direct current	DC			standard length	SL
hertz	Hz			total length	TL
horsepower	hp			variance	Var
hydrogen ion activity	pH				
parts per million	ppm				
parts per thousand	ppt, ‰				
volts	V				
watts	W				

***FISHERY MANAGEMENT REPORT NO. 00-8***

**AREA MANAGEMENT REPORT FOR THE RECREATIONAL  
FISHERIES OF NORTHERN COOK INLET, 1999**

by  
Dave Rutz  
and  
Dana Sweet  
*Division of Sport Fish, Palmer*

Alaska Department of Fish and Game  
Division of Sport Fish, Policy and Technical Services  
333 Raspberry Road, Anchorage, Alaska, 99518-1599

June 2000

Development of this manuscript was partially financed by the Federal Aid in Sport fish Restoration Act (16 U.S.C. 777-777K) under Project F-10-15, Job Nos. S-2-17, S-2-19, S-2-26, S-2-29, and S-2-33.

The Fishery Management Reports series was established in 1989 for the publication of an overview of Division of Sport Fish management activities and goals in a specific geographic area. Fishery Management Reports are intended for fishery and other technical professionals, as well as lay persons. Fishery Management Reports are available through the Alaska State Library and on the Internet: <http://www.sf.adfg.state.ak.us/statewide/divreports/html/intersearch.cfm> This publication has undergone regional peer review.

## LIST OF TABLES

Table	Page
1. Number of angler-days of sport fishing effort expended by recreational anglers fishing Northern Cook Inlet Management Area waters as estimated by SWHS, 1977-1998.....	9
2. Angler-days of sport fishing effort for the Knik Arm drainage by fishery as estimated by SWHS, 1977-1998.....	12
3. Angler-days of sport fishing effort for the eastside Susitna River drainage by fishery as estimated by SWHS, 1977-1998.....	14
4. Angler-days of sport fishing effort for the westside Susitna River drainage by fishery as estimated by SWHS, 1977-1998.....	16
5. Angler-days of sport fishing effort for the West Cook Inlet drainage by fishery as estimated by SWHS, 1977-1998.....	18
6. Northern Cook Inlet Management Area recreational harvest by management unit as estimated by SWHS, 1977-1998.....	20
7. Northern Cook Inlet Management Area sport fish harvest by species as estimated by SWHS, 1977-1998.....	21
8. Knik Arm drainage sport fish harvest by species as estimated by SWHS, 1977-1998.....	24
9. Eastside Susitna River drainage sport fish harvest by species as estimated by SWHS, 1977-1998.....	26
10. Westside Susitna River drainage sport fish harvest by species as estimated by SWHS, 1977-1998.....	27
11. West Cook Inlet drainage sport fish harvest by species as estimated by SWHS, 1977-1998.....	28
12. Percent of fish released by recreational anglers in the Northern Cook Inlet Management Area for 1992-1998.....	29
13. Percent of fish released by recreational anglers in the Knik Arm and Eastside Susitna River areas, 1994-1998.....	30
14. Percent of fish released by recreational anglers in the Westside Susitna River and West Cook Inlet areas, 1994-1998.....	31
15. Estimated economic value of NCIMA sport fisheries during 1986.....	34
16. Economic value for selected NCIMA sport fisheries during 1986.....	35
17. Estimated harvests, by all user groups, of chinook salmon of Northern Cook Inlet origin, 1893-1998.....	40
18. Northern Cook Inlet Management Area-origin chinook salmon estimated harvests, 1977-1998.....	42
19. Chinook salmon biological escapement goals (BEG) for Northern Cook Inlet Management Area waters in 1999.....	44
20. Tyonek subsistence gillnet and Upper Yentna River subsistence and personal use fish wheel salmon harvests, 1980-1999.....	45
21. Northern Cook Inlet Management Area subsistence and personal use gillnet salmon harvests, 1985-1995.....	46
22. Knik Arm Management Unit chinook salmon escapement index counts, 1979-1999.....	52
23. Harvest of chinook salmon from eastside Susitna River, westside Susitna River, West Cook Inlet and Knik Arm drainages as estimated by SWHS, 1979-1998.....	59
24. Eastside Susitna River Management Unit chinook salmon escapement index counts (aerial), 1979-1999.....	60
25. Number of chinook salmon smolt stocked into the Willow Creek drainage from 1985-1999.....	62
26. Contribution of hatchery-reared chinook salmon to the sport harvest and escapement at Willow Creek, 1999.....	63
27. Number of eggs collected during NCIMA salmon egg takes, 1989-1999.....	64
28. Sex and age composition and length-at-age of chinook salmon sampled from the Willow Creek sport harvest, Deshka River weir escapement and Northern Cook Inlet commercial harvest, 1999.....	65
29. Westside Susitna River Management Unit chinook salmon escapement index counts, 1979-1999.....	71
30. West Cook Inlet Management Unit chinook salmon escapement index counts (aerial), 1979-1999.....	77
31. Northern Cook Inlet Management Area recreational harvest of coho salmon by management unit as estimated by SWHS, 1977-1998.....	81
32. Harvest and effort for Little Susitna River coho salmon as estimated by SWHS, 1977-1998.....	83
33. Knik Arm drainage coho salmon escapement index counts, 1981-1999.....	84
34. Coho salmon stocking history for the Little Susitna River, 1982-1995.....	85

## LIST OF TABLES (Continued)

<b>Table</b>	<b>Page</b>
35. Sex and age composition and length-at-age of coho salmon sampled from the Little Susitna River, Deshka River, Cottonwood Creek, Fish Creek and Wasilla Creek weirs, 1999. ....	87
36. Fishing effort and coho salmon harvest from Knik Arm fisheries as estimated by SWHS, 1977-1998.....	92
37. Summary of coho salmon stocked in Cottonwood, Wasilla, Jim, and Fish creeks and the Eklutna tailrace, 1977-1999.....	93
38. Fish Creek salmon harvests, by commercial set gillnet and personal use dip net, 1987-1999.....	95
39. Coho salmon biological escapement goals (BEG) for Knik Arm Management Unit streams.....	96
40. Eastside and westside Susitna River drainage coho salmon escapement index counts, 1981-1999.....	100
41. Bodenbug Creek escapement index surveys, 1968-1999. ....	106
42. Sockeye salmon counts from the Yentna River sonar, Chelatna, Hewitt, Judd, Larson lakes, Fish, Cottonwood, Jim and Packers creeks weirs, and the Little Susitna River weir, 1968-1999. ....	107
43. Big Lake Hatchery (1975-1992), Eklutna Hatchery (1993-1996) and Trail Lakes Hatchery (1997 and 1998) sockeye salmon fry releases into the Big Lake drainage by brood year, 1975-1998. ....	109
44. Educational fishery permit harvests in NCIMA, 1991-1999. ....	115
45. Northern Cook Inlet Management Area lake stocking summary for nonanadromous fish, 1999. ....	118
46. Statewide Harvest Survey estimated harvest and catch for NCIMA stocked lakes, 1998. ....	121
47. Northern Cook Inlet Management Area recreational catch and harvest of rainbow trout by management unit as estimated by SWHS, 1977-1998. ....	122
48. Northern Cook Inlet Management Area recreational catch and harvest of northern pike by management unit as estimated by SWHS, 1977-1998. ....	130
49. Proposed access projects for NCIMA in 1999. ....	137
50. Northern Cook Inlet Management Area stocked lakes access summary, 1999.....	138

## LIST OF FIGURES

<b>Figure</b>	<b>Page</b>
1. Map of the Northern Cook Inlet sport fish management area .....	2
2. Angler-days of sport fishing effort expended by recreational anglers fishing Northern Cook Inlet Management Area waters, 1977-1998. ....	10
3. Mean number of angler-days per year of sport fishing effort expended at sites in the Knik Arm management unit, 1977-1998. ....	13
4. Mean number of angler-days per year of sport fishing effort expended at sites in the eastside Susitna River management unit, 1977-1998. ....	15
5. Mean number of angler-days per year of sport fishing effort expended at sites in the westside Susitna River management unit, 1977-1998. ....	17
6. Mean number of angler-days per year of sport fishing effort expended in the West Cook Inlet drainage, 1977-1998. ....	19
7. Northern Cook Inlet Management Area recreational harvest, 1977-1998. ....	22
8. Northern Cook Inlet Management Area mean recreational harvest by species, 1977-1998. ....	23
9. Percent of the recreational catch of all species from the Northern Cook Inlet Management Area released, 1994-1998, by management unit. ....	32
10. Composition of the Northern Cook Inlet salmon harvest, 1977-1998. ....	33
11. Estimated harvests by all user groups of chinook salmon of Northern Cook Inlet origin, 1893-1998. ....	41
12. Map of the Little Susitna River. ....	49
13. Little Susitna River chinook salmon harvest, 1979-1998. ....	51
14. Map of the Eklutna hatchery and Eklutna powerplant tailrace. ....	53
15. Map of eastside tributaries of the Susitna River. ....	57
16. Map of the Talkeetna River area. ....	58
17. Map of Northern Cook Inlet area. ....	69
18. Map of West Cook Inlet coastal streams. ....	76
19. Map of the Knik Arm drainage. ....	90
20. Fish Creek sockeye salmon escapement, 1968-1999. ....	108
21. Estimated northern pike harvest from Northern Cook Inlet Management Area and statewide, 1977-1998. ....	131

## LIST OF APPENDICES

Appendix	Page
A1. Northern Cook Inlet Management Area sport fish harvest anadromous salmon composition, 1977-1998..	150
A2. Northern Cook Inlet Management Area recreational chinook salmon harvest and catch, 1977-1998. ....	151
A3. Knik Arm drainage chinook salmon harvest by fishery, 1977-1998.....	152
A4. Knik Arm drainage chinook salmon catch by fishery, 1990-1998.....	153
A5. Eastside Susitna River drainage chinook salmon harvest by fishery, 1977-1998. ....	154
A6. Eastside Susitna River drainage chinook salmon catch by fishery, 1990-1998. ....	155
A7. Westside Susitna River drainage chinook salmon harvest by fishery, 1977-1998.....	156
A8. Westside Susitna River drainage chinook salmon catch by fishery, 1990-1998.....	157
A9. West Cook Inlet drainage chinook salmon harvest by fishery, 1977-1998.....	158
A10. West Cook Inlet drainage chinook salmon catch by fishery, 1990-1998.....	159
A11. Northern Cook Inlet Management Area recreational coho salmon harvest and catch, 1977-1998. ....	160
A12. Knik Arm drainage coho salmon harvest by fishery, 1977-1998.....	161
A13. Knik Arm drainage coho salmon catch by fishery, 1990-1998.....	162
A14. Eastside Susitna River drainage coho salmon harvest by fishery, 1977-1998. ....	163
A15. Eastside Susitna River drainage coho salmon catch by fishery, 1990-1998. ....	164
A16. Westside Susitna River drainage coho salmon harvest by fishery, 1977-1998.....	165
A17. Westside Susitna River drainage coho salmon catch by fishery, 1990-1998.....	166
A18. West Cook Inlet drainage coho salmon harvest by fishery, 1977-1998.....	167
A19. West Cook Inlet drainage coho salmon catch by fishery, 1990-1998.....	168
A20. Northern Cook Inlet Management Area recreational sockeye salmon harvest and catch, 1977-1998. ....	169
A21. Knik Arm drainage sockeye salmon harvest by fishery, 1977-1998.....	170
A22. Knik Arm drainage sockeye salmon catch by fishery, 1990-1998.....	171
A23. Eastside Susitna River drainage sockeye salmon harvest by fishery, 1977-1998. ....	172
A24. Eastside Susitna River drainage sockeye salmon catch by fishery, 1990-1998. ....	173
A25. Westside Susitna River drainage sockeye salmon harvest by fishery, 1977-1998.....	174
A26. Westside Susitna River drainage sockeye salmon catch by fishery, 1990-1998.....	175
A27. West Cook Inlet drainage sockeye salmon harvest by fishery, 1977-1998.....	176
A28. West Cook Inlet drainage sockeye salmon catch by fishery, 1990-1998.....	177
A29. Northern Cook Inlet Management Area recreational pink salmon harvest, 1977-1998.....	178
A30. Knik Arm drainage pink salmon harvest by fishery, 1977-1998. ....	179
A31. Eastside Susitna River drainage pink salmon harvest by fishery, 1977-1998.....	180
A32. Westside Susitna River drainage pink salmon harvest by fishery, 1977-1998.....	181
A33. West Cook Inlet drainage pink salmon harvest by fishery, 1977-1998. ....	182
A34. Northern Cook Inlet Management Area recreational chum salmon harvest, 1977-1998. ....	183
A35. Knik Arm drainage chum salmon harvest by fishery, 1977-1998.....	184
A36. Eastside Susitna River drainage chum salmon harvest by fishery, 1977-1998. ....	185
A37. Westside Susitna River drainage chum salmon harvest by fishery, 1977-1998.....	186
A38. West Cook Inlet drainage chum salmon harvest by fishery, 1977-1998.....	187
A39. Northern Cook Inlet Management Area sport fish harvest resident fish composition, 1977-1998. ....	188
A40. Northern Cook Inlet Management Area recreational landlocked salmon harvest and catch, 1977-1998. ....	189
A41. Knik Arm waters landlocked salmon harvest by fishery, 1977-1998. ....	190
A42. Knik Arm waters landlocked salmon catch by fishery, 1990-1998. ....	191
A43. Eastside Susitna River drainage landlocked salmon harvest and catch, 1977-1998. ....	192
A44. Northern Cook Inlet Management Area recreational rainbow trout harvest and catch, 1977-1998.....	193
A45. Knik Arm drainage rainbow trout harvest by fishery, 1977-1998. ....	194
A46. Knik Arm drainage rainbow trout catch by fishery, 1990-1998. ....	195

# INTRODUCTION

This report is divided into two sections. Section I presents an introductory overview of the Northern Cook Inlet Management Area. Included in this section are a general geographic and organizational description of the management area; an inventory of the available fishery resources of the management area; an overview of the Alaska Board of Fisheries processes; existing management plans; a historical perspective of recreational angler effort, catch, and harvest within management area waters; and an approximation of the economic value of the recreational fisheries of the management area. A general description of research, management and educational activities, ongoing access programs, and a summary of the current major biological and social issues in the Northern Cook Inlet Management Area are also presented. Section II provides a more detailed summary of the major fisheries in the Northern Cook Inlet Management Area. Included in this section are a description and historical perspective of each fishery; the objective governing their management; and descriptions of recent fishery performance, recent Board of Fisheries actions, social and biological issues, and ongoing or recommended research and management activities.

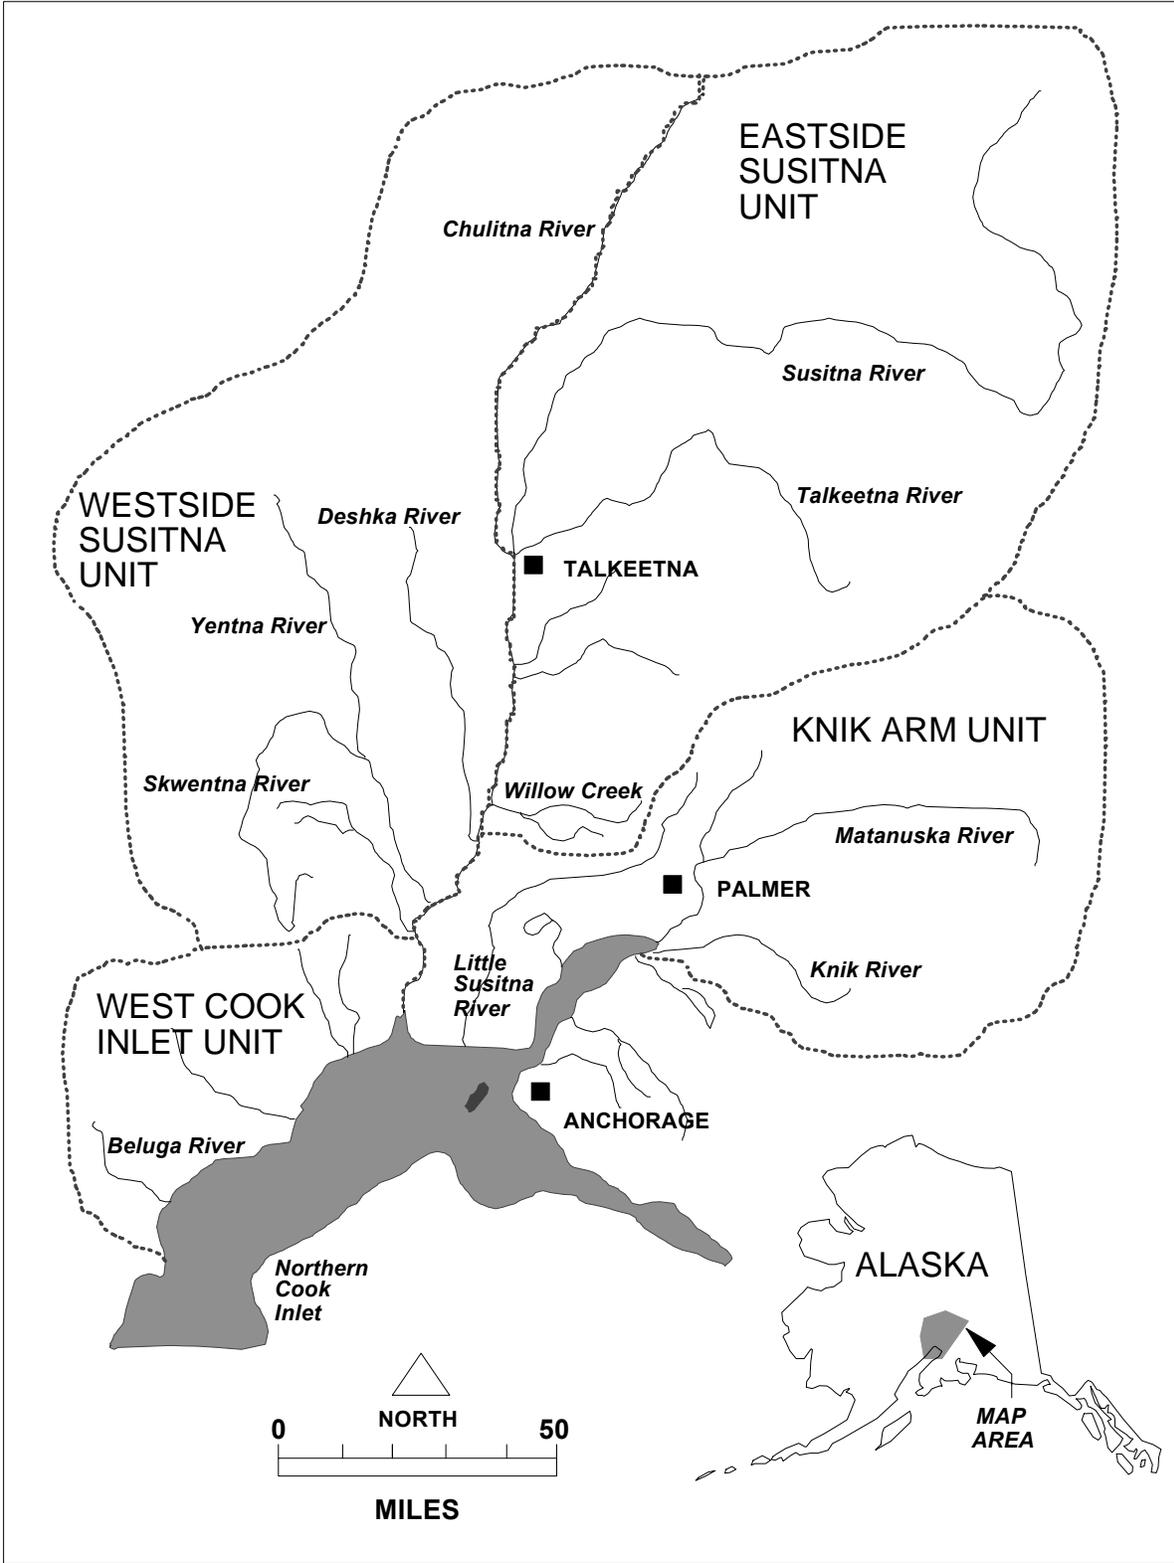

## SECTION I: MANAGEMENT AREA OVERVIEW

### MANAGEMENT AREA DESCRIPTION

The Northern Cook Inlet sport fish management area (NCIMA) includes all freshwater drainages and adjacent marine waters of Upper Cook Inlet between the West Foreland and the Eklutna River, excluding the upper Susitna River drainage above the Oshetna River confluence (Figure 1). The management area encompasses approximately 23,000 square miles and is dominated by the Susitna River drainage which originates in glaciers of the Alaska and Talkeetna mountain ranges and flows about 200 miles in a southerly direction before entering Cook Inlet near Anchorage. Most sport fisheries in the NCIMA are easy to access by road or jet-boat, with the exception of the remote West Cook Inlet Unit (WCI) waters which are accessible only by boat or aircraft.

For the purposes of management and harvest reporting, the NCIMA is segregated into four major units (Figure 1):

1. Knik Arm Unit: This unit includes all waters of the Matanuska and Knik River drainages, the Little Susitna River drainage, and all waters draining into Knik Arm excluding those entering south and west of the Eklutna River; all adjacent marine waters of Cook Inlet; and the waters of the Nancy Lake Recreation Area.
2. Eastside Susitna Unit: This unit includes all drainages of the upper Susitna River above the Chulitna River to and including the Oshetna River drainage, all eastside drainages of the Chulitna River, and all eastside drainages of the Susitna River below its confluence with the Chulitna River to and including Willow creek to the south and waters of the Nancy Lake Recreation Area. This management unit has no marine waters.
3. Westside Susitna Unit: This unit includes all westside drainages of the Chulitna River, and all westside drainages of the Susitna River below its confluence with the Chulitna River and, primarily for management purposes, eastside drainages of the Susitna River within a half

**Figure 1.-Map of the Northern Cook Inlet sport fish management area.**

mile of the Susitna River downstream of Willow Creek. This management unit has no marine waters.

4. West Cook Inlet Unit: This unit includes all freshwater drainages entering Cook Inlet between the Susitna River and the West Foreland, and all adjacent marine waters of Cook Inlet.

The NCIMA is comprised of two complete and a portion of a third Statewide Harvest Survey (SWHS) reporting area (Howe et al. 1998). These areas include: (1) the Knik Arm Drainage Area reporting unit (Area K), (2) the East Susitna River Drainage Area reporting unit (Area M), and (3) the West Cook Inlet-West Susitna River Drainages Area reporting unit (Area N). The West Cook Inlet-West Susitna River Drainages Area includes fresh and marine waters between the West Foreland and Cape Douglas, an area outside of the NCIMA; Area N fisheries outside of the NCIMA are not included in this report.

In terms of political geography, the management area is very similar to the boundaries of the Matanuska-Susitna Borough. About 60% of the state's population resides within or immediately adjacent to the management area. Major communities within the management area include Wasilla, Palmer, Talkeetna, Willow, and Houston. Smaller communities in the management area include Tyonek, Sutton, Chickaloon, and Skwentna. The Municipality of Anchorage, Alaska's largest community, borders the management area. Although much of Alaska's population resides in or near the NCIMA, it is important to note that much of the management area is either sparsely populated or uninhabited. The State of Alaska is the principal land manager in the NCIMA. Other significant land managers in the NCIMA include the Matanuska-Susitna (Mat-Su) Borough, various native corporations and villages, and the federal government.

Management and research functions for the NCIMA are conducted from the Alaska Department of Fish and Game (ADF&G) Palmer area office. The Division of Sport Fish staff stationed in Palmer include a permanent full-time Fisheries Biologist III Area Management Biologist (David Rutz), a permanent full-time Fisheries Biologist III Area Research Biologist, Assistant to the Manager (Dana Sweet), Lakes Specialist (Craig Bear), Maintenance Access Coordinator (Larry Erie), and two permanent full-time Fisheries Biologist II Research Biologists (Suzanne Hayes and Robert Lafferty). One permanent full-time Administrative Assistant III (Nancy Deslauriers) and an Administrative Assistant II (Leslie Adams) are shared with the Division of Wildlife Conservation staff. These positions are assisted by approximately 30 permanent-seasonal Fisheries Biologists and Fish and Wildlife Technicians who act as crew leaders and staff for area research and management projects. Significant support is also provided to the area staff from the Sport Fish Division's Southcentral region Policy and Technical Services (PTS) staff. A regional maintenance worker (James Whitt, Jr.) performs maintenance services for the Southcentral region from a shop located in Palmer.

## **FISHERIES RESOURCE INVENTORY**

Sport anglers fishing NCIMA waters can target all five species of North American Pacific salmon (pink *Oncorhynchus gorbusha*, coho *O. kisutch*, sockeye *O. nerka*, chum *O. keta*, and chinook *O. tshawytscha*) in both fresh and salt water. In addition, there are major fisheries for rainbow trout *O. mykiss*, Dolly Varden *Salvelinus malma*, Arctic char *Salvelinus alpinus*, and Arctic grayling *Thymallus arcticus*; as well as for lake trout *Salvelinus namaycush*, northern pike

*Esox lucius*, burbot *Lota lota*, whitefish *Coregonus* and *Prosopium*, landlocked salmon *Oncorhynchus*, and smelt *Osmeridae*.

## **ALASKA BOARD OF FISHERIES ACTIVITIES**

The waters of the NCIMA fall within two sport fishing regulatory areas: the Susitna/West Cook Inlet Regulatory Area and the Cook Inlet/Resurrection Bay Salt Water Regulatory Area. Regulations governing the sport fisheries of the Susitna/West Cook Inlet and the Cook Inlet/Resurrection Bay Salt Water Regulatory Areas are established in Chapters 61 and 58, respectively, of Title 5 of the Alaska Administrative Code. Regulations pertaining to other Cook Inlet fisheries including subsistence (Chapter 01), personal use (Chapter 77), educational permits (Chapter 93), statewide provisions (Chapter 75) and commercial fisheries (Chapter 21) are also contained in Title 5 of the Alaska Administrative Code.

The process of developing fishing regulations appropriate for fisheries in the NCIMA occurs within the established Alaska Board of Fisheries (BOF) process. Public input concerning regulation changes and allocation issues is provided for in this process through various means including submission of proposals, direct testimony to the BOF, and/or participation in local fish and game advisory committees. Advisory committees have been established throughout Alaska to assist the Boards of Fisheries and Game in assessing fisheries and wildlife issues and proposed regulations. Active committees meet several times each year. Staff from the Division of Sport Fish and other divisions are often invited to attend the committee meetings. In this way, advisory committee meetings allow for direct public interaction with staff involved with resource issues of local concern. Within the NCIMA there are four Fish and Game Advisory Committees: Denali, Matanuska, Tyonek and Mt. Yenlo. Staff also have significant interaction with the Anchorage Advisory Committee which is outside, but bordering, the NCIMA. Under the current operating schedule the BOF meets on a 3-year cycle. Proposals regarding the NCIMA resident finfish species were addressed most recently in October 1998. The remaining finfish regulations were addressed in February 1999. An out-of-cycle BOF meeting was called in 2000 to address the Cook Inlet coho conservation issue. The next regularly scheduled BOF meetings are scheduled for 2001 and 2002. Appendix F provides a summary of BOF regulatory actions.

## **EXISTING MANAGEMENT PLANS**

Upper Cook Inlet fisheries have been the focus of intensive allocation battles for many years. These conflicts have lead the BOF to establish numerous management plans and policies to guide the area's fisheries. These plans attempt to assure sustained yield of the area's fish resources, as well as establishing allocations, management actions and guidelines.

There are 10 management plans or policies which the BOF has adopted that impact NCIMA fisheries. These are:

1. Upper Cook Inlet Salmon Management Plan (5 AAC 21.363),
2. Northern District King Salmon Management Plan (5 AAC 21.366),
3. Fish Creek Sockeye Salmon Management Plan (5 AAC 21.364),
4. Big River Sockeye Salmon Management Plan (5 AAC 21.368),
5. Little Susitna River Coho Salmon Management Plan (5 AAC 61.060),
6. Criteria for Establishing Special Management for Trout (5 AAC 75.013),

7. Packers Creek Sockeye Salmon Management Plan (5 AAC 21.370),
8. Northern District Salmon Management Plan (5 AAC 21.358),
9. Upper Cook Inlet Personal Use Salmon Fishery Management Plan (5 AAC 77.540), and
10. Upper Yentna River Subsistence Salmon Fishery (5 AAC 01.593).

The Upper Cook Inlet Salmon Management Plan (5 AAC 21.363) (UCISMP) provides long-term direction to the Board for allocation and conservation of fisheries involving UCI salmon stocks. The plan defines UCI salmon stocks as those that move through the Northern and Central Districts and spawn in waters draining into those districts. Various “step down” management plans relate to the Upper Cook Inlet Salmon Management Plan and provide specific direction to fishery managers regarding user groups, time, area or species.

The Upper Cook Inlet Salmon Management Plan established the following provisions for the management and conservation of UCI salmon stocks:

1. Provide for a subsistence priority.
2. Harvest of UCI salmon will be governed by specific and comprehensive management plans.
3. In adopting these plans the following will be considered: need for subsistence, protection of fisheries habitat, and the needs and demands of user groups.
4. The management plans may address: the need to allocate harvestable surplus among commercial, sport, guided sport and personal use fisheries and the need to allocate the harvestable surplus within user groups.
5. In the absence of a specific management plan salmon shall be harvested in the fisheries that have historically harvested them.
6. In the absence of a specific management plan the burden of conservation shall be shared among all user groups in close proportion to their respective harvest.

Included in the UCISMP are eight guiding principals to assist the Board of Fisheries when taking actions associated with adoption of regulations regarding upper Cook Inlet salmon stocks. These principles are:

1. Conservation and sustained yield of healthy salmon resources and maintenance of the habitat and ecosystem on which salmon and allied species depend for survival throughout their life-cycle;
2. Maintenance of viable and diverse fish species and stocks;
3. Maintenance of the genetic diversity of fish species and stocks;
4. Presentation to the Board of the best available information;
5. Proposed actions should be capable of being implemented and evaluated. This consideration includes factors such as flexible and adaptive management, conflict with other law and mixed-stock management;
6. Proposed actions should provide tangible benefits to user groups or conservation, with the least risk to existing fisheries and to conservation;

7. Maintenance of the stability and viability of sport, commercial and personal use fisheries.
8. Use a precautionary approach in a manner consistent with the degree of uncertainty regarding the status and biology of the resource.

The Tyonek subsistence fishery (5 AAC 01.560) is an important component of the Upper Cook Inlet Salmon Management Plan. This fishery provides subsistence fishing opportunity primarily to residents of the village of Tyonek. Fish harvested in this fishery are bound for NCIMA. Specific fishing periods occur from May 15 through October 15. This fishery has been regulated by a 4,200 chinook salmon harvest quota since 1980.

The Northern District King Salmon Management Plan (5 AAC 21.366) was adopted in 1985 by the BOF. This plan provides for the management of the commercial harvest of chinook salmon in the Northern District as follows.

1. The season runs from June 1 through June 24, unless closed by emergency order.
2. Fishing periods are 7:00 a.m. to 1:00 p.m. on Mondays, with the number of periods determined by the department based on expectations of run strength.
3. Harvest shall not exceed 12,500.
4. Set gillnets may not exceed 35 fathoms in length and six inches in mesh size.
5. No CFEC permit holder may operate more than one set gillnet at a time.
6. No net shall be set within 1,200 feet of another.
7. No net shall be placed seaward of another.
8. June 1 through June 24 the area from 1 mile south of the Theodore River to the Susitna River is open the first Monday in June only. Provisions of this paragraph do not apply after December 31, 2001.
9. If at least 90% of the biological escapement goal (BEG) for the Theodore River (BEG = 750) or Chuitna River (BEG = 1,400) is not met during the fishing season, the area from 1 mile south of the Chuitna River to the Susitna River will be closed to commercial fishing during the following fishing season; the provisions of this paragraph do not apply after December 31, 2001.
10. If at least 90% of the biological escapement goal (BEG) for the Chuitna River is not met during the fishing season, the Chuitna River shall be closed to sport fishing for king salmon during the following fishing season. Provisions of this paragraph do not apply after December 31, 2001.

The Fish Creek Sockeye Salmon Management Plan (5 AAC 21.364) was adopted by the BOF in 1985 and modified in 1996. This plan governs the harvest of Fish Creek sockeye salmon in excess of the system's 50,000 escapement goal. It presently provides for a terminal set gillnet commercial fishery in Knik Arm near the mouth of Fish Creek July 15 through July 26. This fishery was closed by the BOF in 1999 and will remain closed until new information is available at the next scheduled BOF meeting.

The Big River Sockeye Salmon Management Plan (5 AAC 21.368) authorizes a harvest of Big River salmon by set gillnets in the Kustatan Subdistrict of the Central District. Sockeye salmon

is the targeted species. This fishery extends from May 25 through June 24, but is subject to emergency closure when the incidental harvest of chinook salmon exceeds 1,000 fish.

The Little Susitna River Coho Salmon Management Plan (5 AAC 61.060) was adopted by the BOF in 1990 and modified in 1992 and 1996. The purpose of this plan is to ensure an adequate spawning escapement of coho salmon into the Little Susitna River and provide management guidelines to the department. The escapement goal is set at 9,600-19,200 coho salmon above the Parks Highway bridge. The management plan also sets the daily bag and possession limits at 3 and limits tackle to artificial lures from July 16 through August 5.

The Criteria For Establishing Special Management For Trout (5 AAC 75.013) was adopted by the BOF in November 1996 from the Cook Inlet and Copper River Basin Rainbow/Steelhead Trout Management Policy. These criteria provide future Fisheries Boards, ADF&G managers, and the sport fishing public with the following:

1. Management policies and implementation directives for Cook Inlet rainbow and steelhead trout, and
2. A systematic approach to developing sport fishing regulations that includes a process for rational selection of waters for such special management as catch-and-release, trophy areas and high yield fisheries.

The Packers Creek Sockeye Salmon Management Plan (5 AAC 21.370) directs the department not to base commercial fishing time in the Kalgin Island subdistrict on enhanced run strength of Packers Creek sockeye salmon. The plan limits extra fishing time to no more than one additional fishing period per week.

The Northern District Salmon Management Plan (5 AAC 21.358) provides for the following management guidelines:

1. Minimizes the harvest of coho salmon bound for the Northern District of UCI and provides the department direction for management of salmon stocks.
2. Manage the Northern district commercial salmon fisheries based on abundance of Yentna River sockeye salmon, or other salmon indices as it deems appropriate.
3. Manage the Northern district commercial salmon fisheries to minimize the incidental take of coho salmon stocks bound for the Northern District.
4. Restricts Central District drift gillnet fishery weekly fishing periods unless late-run sockeye salmon to the Kenai River will be more than 4 million.
5. Personal use fishing with a set gillnet is prohibited in the Northern District.
6. Employ a precautionary approach to chum salmon management.
7. To minimize the harvest of coho salmon, no targeted pink salmon fishing will be allowed in the Central and Northern districts until a pink salmon management plan is brought to the Board in 2002.
8. Directs the department to conduct habitat assessments to determine loss of riparian habitat by noncommercial fishermen.

The Upper Cook Inlet Personal Use Salmon Fishery Management Plan (5 AAC 77.540) establishes time, area, methods and means for taking salmon for personal use. This plan first went into effect during the 1996 season. Salmon harvest opportunity was established to replace the harvest opportunity which previously was provided through the Upper Cook Inlet Subsistence Salmon Management Plan which was repealed by the BOF in 1995. The Upper Cook Inlet Personal Use Salmon Fishery Management Plan provides for personal use dip net fisheries in the Kenai and Kasilof rivers and Fish Creek. Additionally, limited personal use gillnet fishing opportunity is provided near the terminus of the Kasilof River.

The Upper Yentna River Subsistence Salmon Fishery (5 AAC 01.593) establishes a subsistence fish wheel fishery for salmon other than king salmon in the Yentna River downstream of its confluence with the Skwentna River to the confluence of Martin Creek. A seasonal limit of 2,500 salmon was set. This fishery was implemented as a personal use fishery during the 1996 and 1997 seasons. State Supreme Court and BOF action changed it to a subsistence fishery beginning in 1998.

Fisheries for other species not covered by the above management plans or policies are managed to assure sustained yield of the targeted fish stock while assuring for the continued, and where possible, the expanded opportunity to participate in the fishery.

## **RECREATIONAL ANGLER EFFORT**

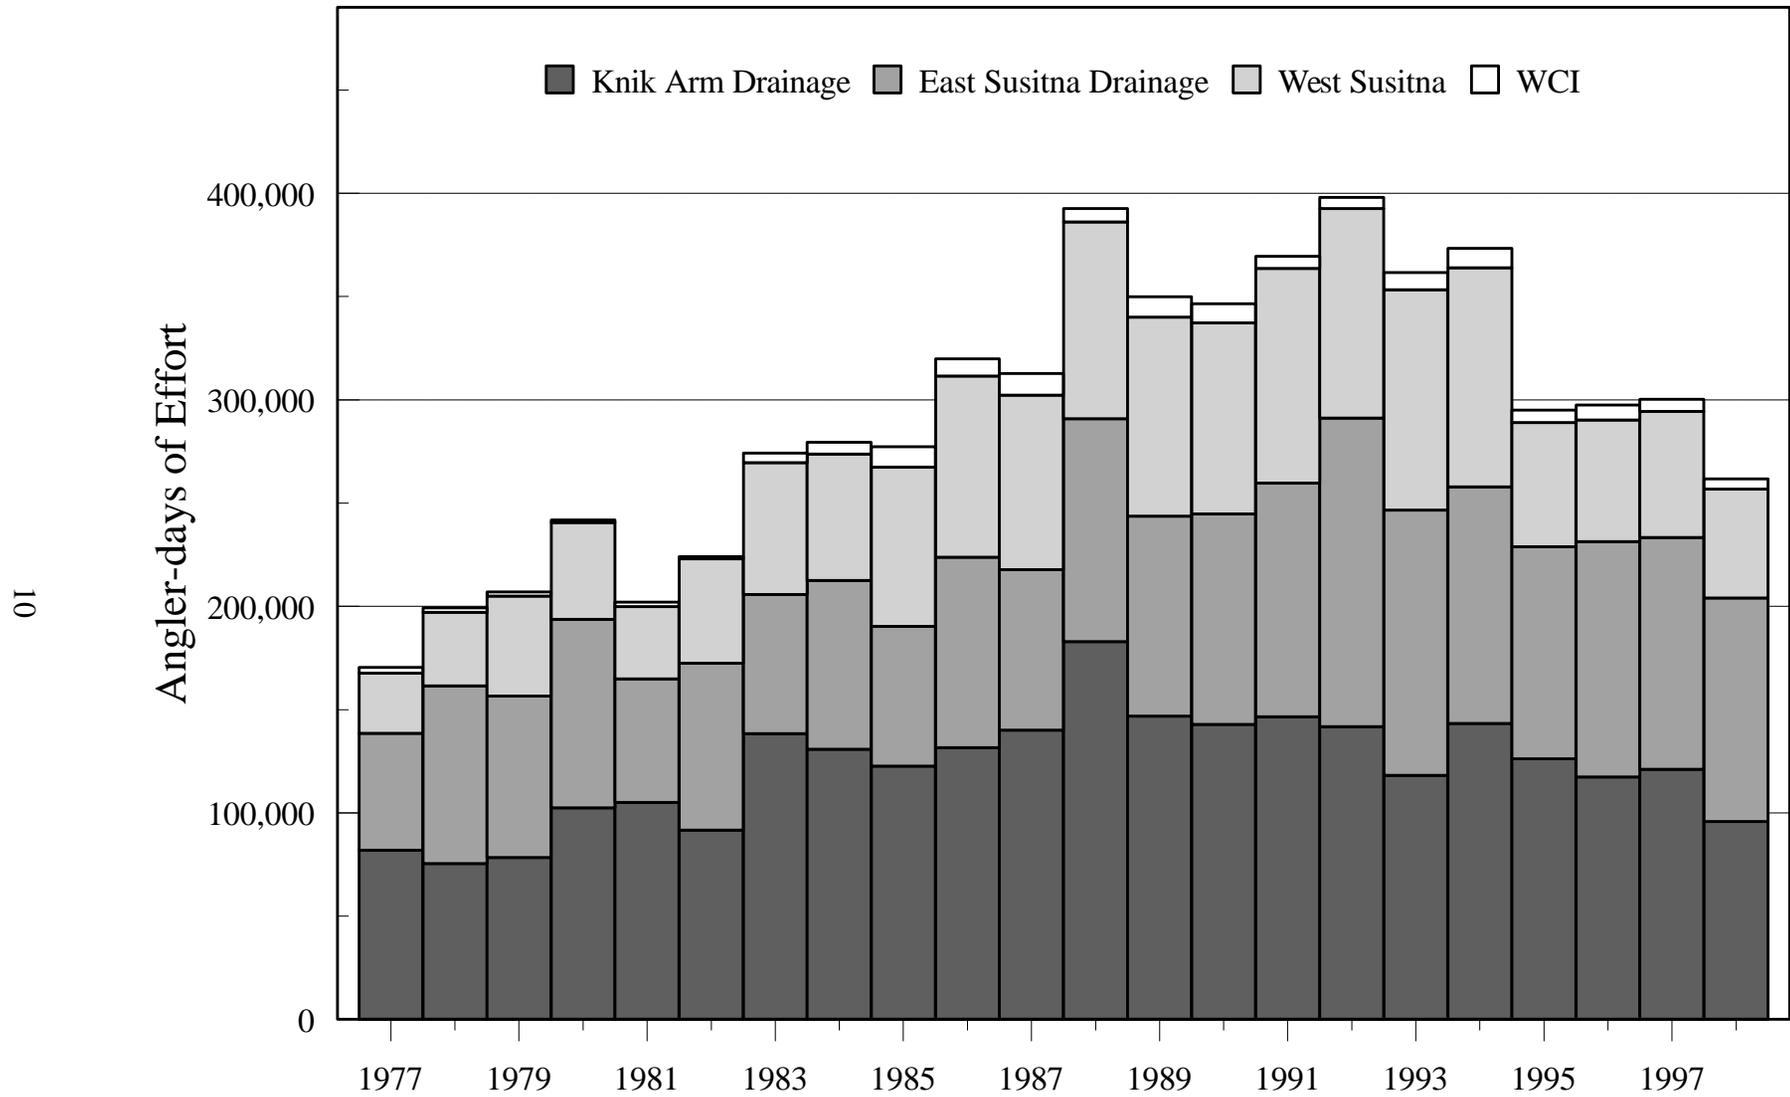

Beginning in 1977, recreational angler effort in the NCIMA has been estimated using the Statewide Harvest Survey (SWHS), a mail survey (Mills 1979-1994, Howe et al. 1995-1999). This survey estimates the number of angler-days of sport fishing effort expended by recreational anglers fishing Alaskan waters, as well as the harvest and beginning in 1990, catch (number harvested plus number released) of important sport species. The SWHS is designed to provide estimates of effort, harvest and catch by site and, unfortunately, is not designed to provide estimates of effort directed towards a single species at a site. Additionally, onsite creel surveys have been selectively used for fisheries that require more detailed information or inseason management. The following summary of recreational angler effort in the NCIMA is based on the SWHS data.

From 1977 through 1997, an average of 295,049 angler-days have been spent by anglers fishing NCIMA waters (Table 1). Historically, the effort expended by anglers fishing NCIMA waters has represented an average of 14% of the total statewide and 20% of the Southcentral region (Region II) angling effort. Angler-effort generally increased annually from 1977 through 1988 (Figure 2), when 392,875 angler-days were documented. During 1988-1997, effort has ranged from 295,081 angler-days (1995) to a record high in 1992 of 398,225 angler-days. The Kenai Peninsula sport fish management area is currently the only management area in Alaska which receives greater use by recreational anglers (Howe et al. 1999).

**Table 1.-Number of angler-days of sport fishing effort expended by recreational anglers fishing Northern Cook Inlet Management Area waters as estimated by SWHS, 1977-1998.**

<sup>a</sup> Data include saltwater effort from outside the NCIMA as reported in the SWHS.

**Figure 2.-Angler-days of sport fishing effort expended by recreational anglers fishing Northern Cook Inlet Management Area waters, 1977-1998.**

During 1998 anglers spent an estimated 261,784 angler-days fishing NCIMA waters. This falls below the previous 5-year average and is the lowest annual effort recorded since 1982. The effort in 1998 represented 12% and 18% of the total statewide and Southcentral region angling effort, respectively (Table 1).

Forty-two percent of the total effort from the NCIMA has historically occurred in the Knik Arm Management Unit (Table 1). From 1977 through 1997, these waters supported an average of 123,156 angler-days of fishing effort. A record number of angler-days (183,029) were expended during 1988. Nearly all of the effort over this period was expended in fresh water (Table 2). The Little Susitna River is the most heavily fished stream in the Knik Arm Management Unit, averaging 36,469 angler-days of effort for the period 1977-1997 (Table 2, Figure 3). Other major fisheries occur in the many stocked lakes in the basin (notably in Finger Lake and the Kepler Lake Complex) and at various road-accessible streams including Knik River tributaries, the Eklutna Power Plant tailrace, Big Lake drainage, and Cottonwood and Wasilla creeks (Table 2, Figure 3). A limited saltwater fishery also occurs off the mouth of Fish Creek in Knik Arm (Table 2).

Anglers fishing the Eastside Susitna Management Unit from 1977 through 1997 expended an average of 94,346 angler-days (Table 1). This expenditure of effort has represented an average of 32% of the total sport effort from all NCIMA waters during this time period. A total of 108,134 angler-days were spent in this area during 1998, falling slightly below the previous 5-year average (1993-1997). Major fisheries occur in Willow, Montana, Sheep, and Little Willow creeks, and the Talkeetna River and its various tributaries (Table 3, Figure 4).

Anglers fishing the Westside Susitna Management Unit from 1977 through 1997 expended an average of 71,569 angler-days (Table 1). This expenditure of effort has represented an average of 24% of the total effort from all NCIMA waters during this time period. A total of 52,803 angler-days occurred during 1998, a considerable decrease from the previous 5-year average and the lowest on record since 1982. Major fisheries occur in the Deshka River, Alexander Creek, and the Yentna River including Lake Creek (Table 4, Figure 5). Other fisheries occur in numerous remote lakes in the area (Table 4, Figure 5).

From 1977 through 1997 anglers fishing West Cook Inlet Management Unit waters expended an average of 5,978 angler-days (Table 1). This expenditure of effort represents an average of 2% of the total effort from all NCIMA waters during this time period. A record number of angler-days (10,594) were spent in this area in 1987. A total of 4,943 angler-days occurred during 1998, a considerable decrease from the previous 5-year average and the lowest on record since 1983. All the annual effort has been expended in fresh water. Major fisheries include the Chuitna and Theodore river drainages (Table 5, Figure 6).

## **RECREATIONAL FISH HARVEST**

From 1977 through 1997, an average of 200,578 fish were caught and kept (harvested) by anglers fishing NCIMA waters (Tables 6 and 7, Figure 7). Coho salmon, rainbow trout and chinook salmon accounted for approximately half of this average harvest (Figure 8).

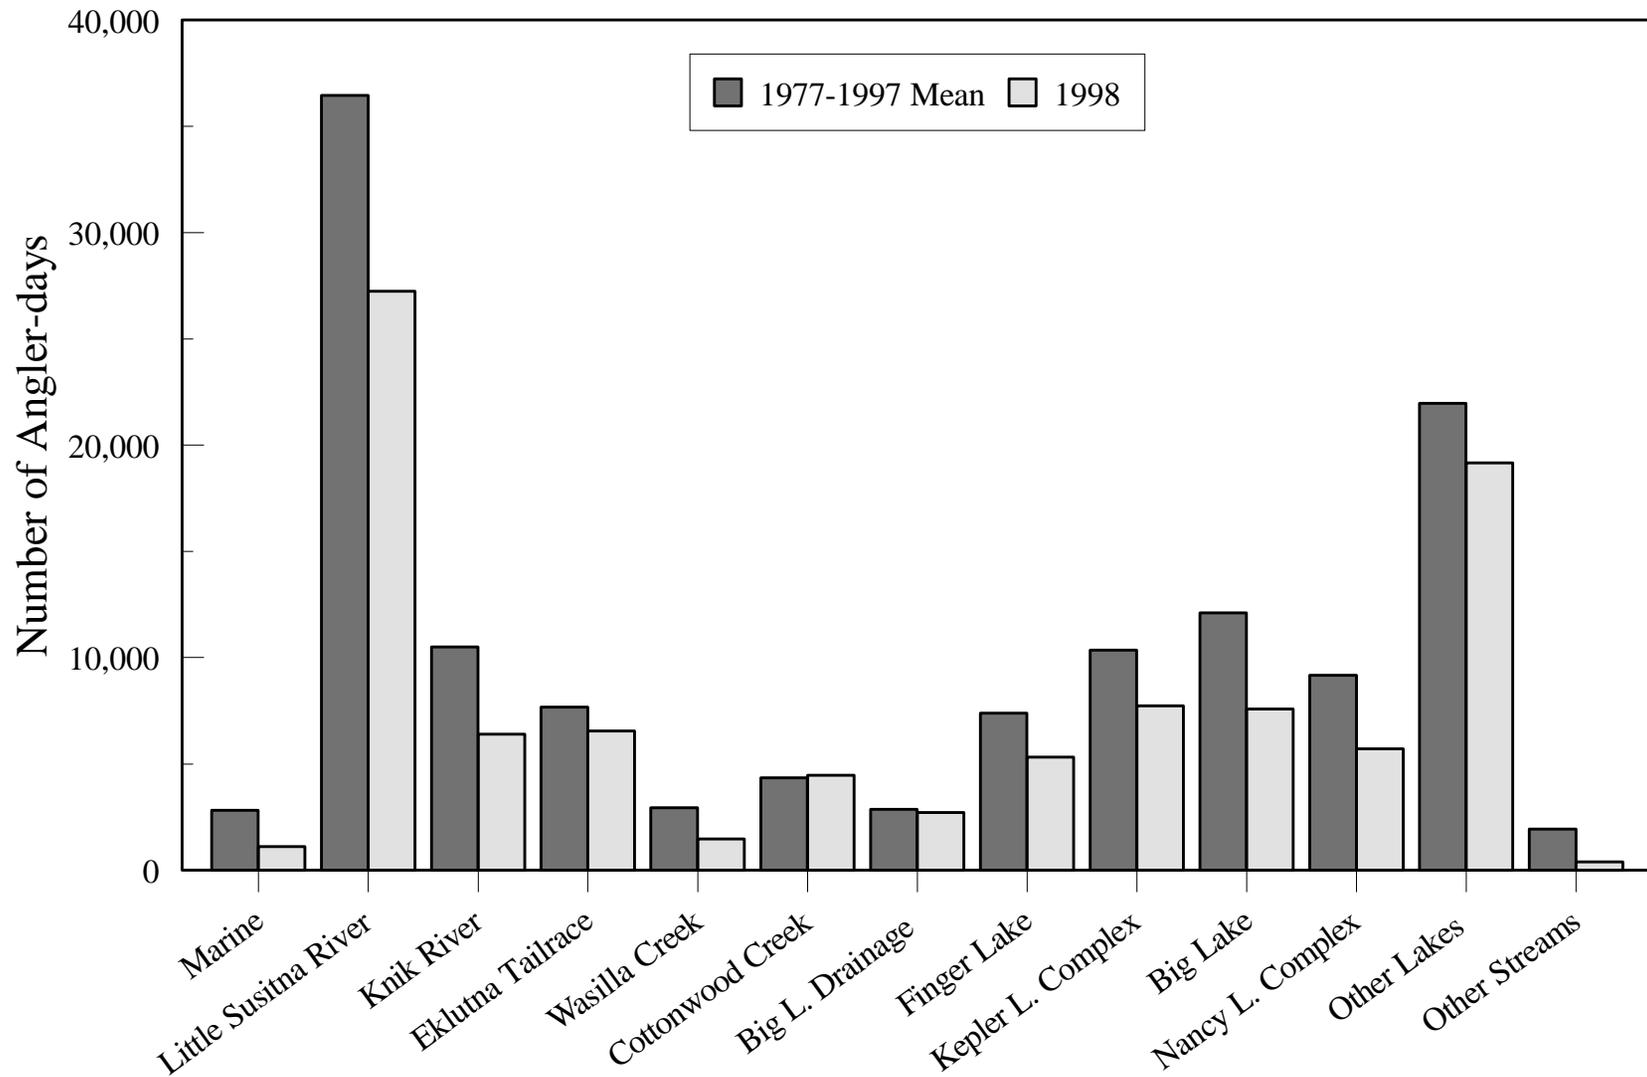

On average, fish from the Knik Management Unit accounted for 45% of fish caught and kept within the NCIMA during 1977-1997 (Table 6). The harvest was dominated by rainbow trout, coho salmon and landlocked salmon (Table 8). The Eastside Susitna and Westside Susitna units

accounted for 28% and 24% of the NCIMA harvest during this time period, respectively, with chinook salmon, coho salmon, pink salmon, rainbow trout and Arctic grayling dominating harvests (Tables 6, 9 and 10). The West Cook Inlet Unit accounted for only 2% of the NCIMA harvest, with chinook and coho salmon accounting for 64% of the WCI harvest (Table 11).

The 1977-1998 NCIMA harvests by fishery of all species are listed in Appendix A.

### **RECREATIONAL FISH CATCH AND RELEASE**

Estimates of the number of fish caught and released by anglers fishing NCIMA waters became available for the first time during 1990 (Mills 1991-1994, Howe et al. 1995-1999). From 1992 through 1998 the average percent released was approximately 65% of the total catch (Table 12).

The proportion and type of fish released by anglers varies within and among management units (Howe et al. 1995-1999) (Tables 13 and 14). Pink salmon, chum salmon, Arctic grayling, and rainbow trout were the most frequently released fish species during 1992-1998. In all units during 1994-1998, the number of fish caught and released was greater than the number of fish caught and harvested, except in the West Cook Inlet Unit (Figure 9).

### **OTHER USER GROUPS**

Salmon returning to the NCIMA are also harvested by various commercial set and drift gillnet fisheries located throughout Upper Cook Inlet (Appendix B1). In nearly all cases harvests in the commercial fisheries are much larger than in NCIMA sport fisheries (Figure 10). The average commercial harvest from 1977 through 1998 was 5.3 million salmon by the various commercial fisheries of Upper Cook Inlet, whereas during this same period an average of approximately 100,000 anadromous salmon were harvested annually by recreational anglers (Table 7 and Appendix B2). Chinook salmon are the exception: beginning in 1989 the yearly harvest of chinook salmon in the recreational harvest exceeded the commercial harvest in all but one year (Table 7, Appendix B2).

It is generally believed that not all commercial fisheries in Upper Cook Inlet intercept the same proportion of NCIMA salmon stocks. For purposes of management, it has generally been assumed that NCIMA salmon stocks are intercepted to a larger extent in the driftnet and Western Subdistrict setnet fisheries of the Central District (Appendices B3 and B4) and in the setnet fishery of the Northern District (Appendices B5-B9) than in other commercial fishing districts. Although quantifiable estimates of contribution to these commercial fisheries by specific stock units are not available for many of the species, a consistently high proportion of the harvests in the Northern District setnet fisheries is assumed to be composed of NCIMA stocks. Catch sampling of the Northern District setnet fishery in 1998 resulted in an estimated 5% contribution of Upper Cook Inlet-released hatchery fish. Upper Cook Inlet hatchery-released fish contributed 4% of the commercial harvest in 1999 (Appendix B11). However, it is presently unknown how this contribution relates to the overall contribution of specific NCIMA wild stocks to the Northern District setnet fishery. The proportional harvests of NCIMA salmon stocks in the Central District drift and setnet fisheries are assumed to be dependent on both time and area fished.

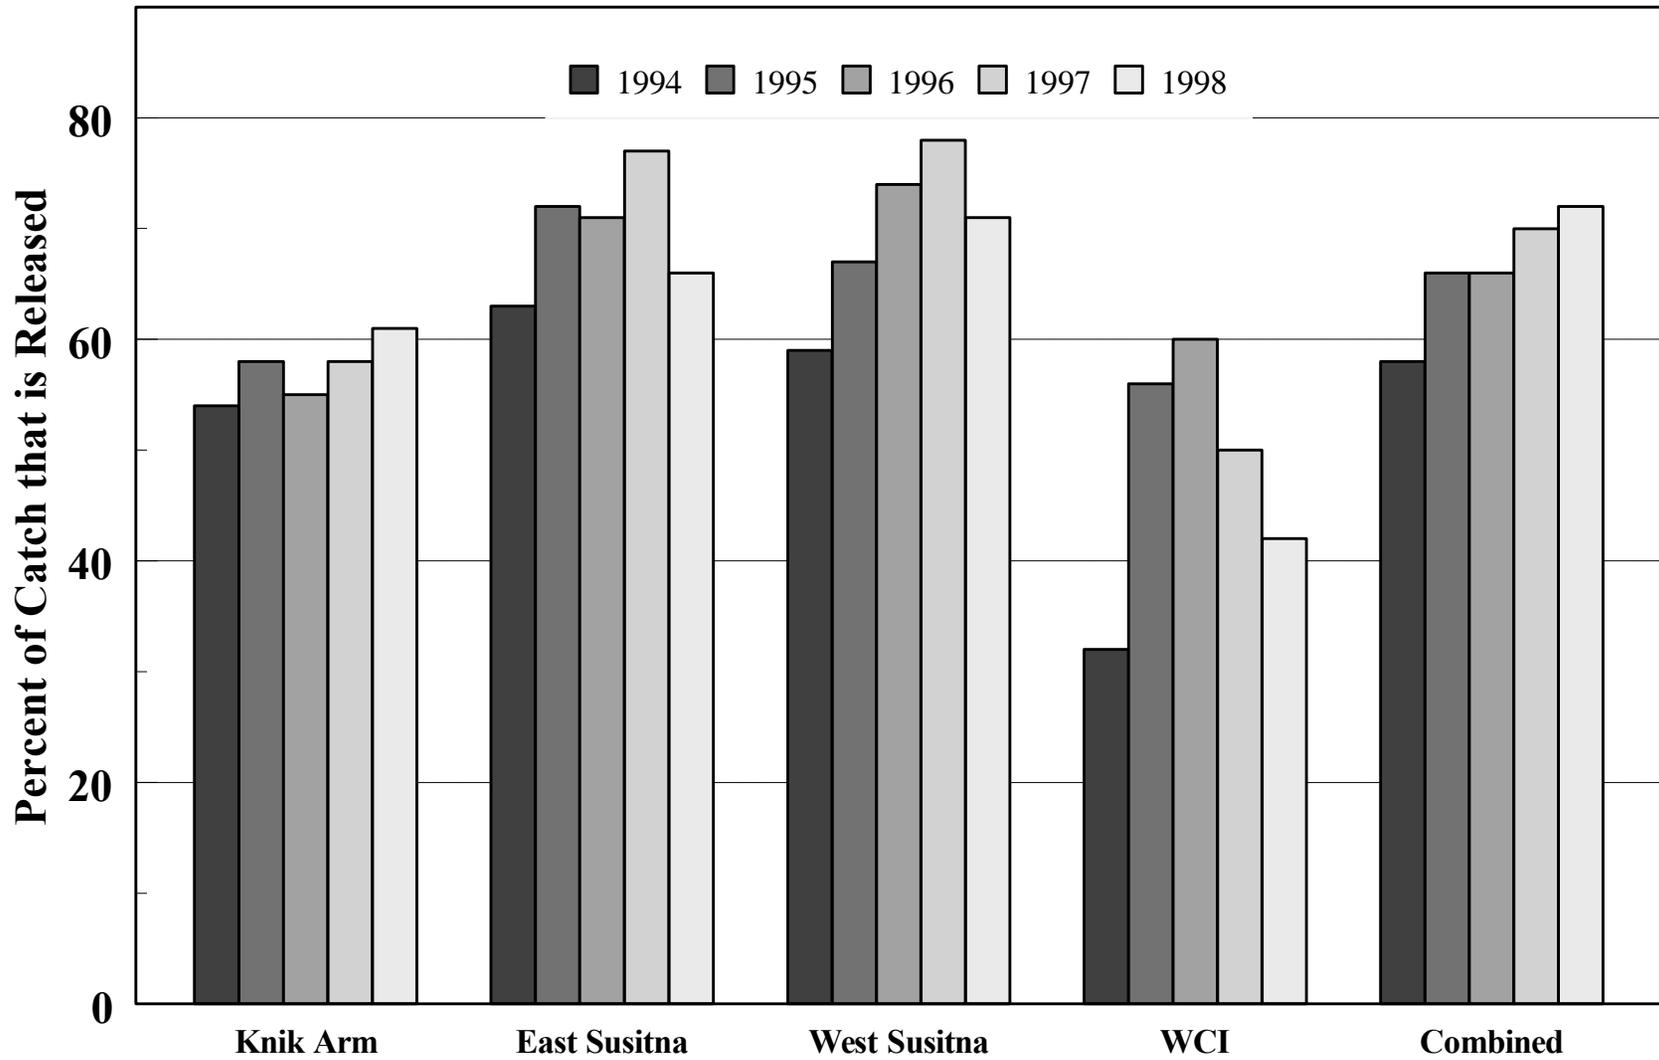

Figure 9.-Percent of the recreational catch of all species from the Northern Cook Inlet Management Area released, 1994-1998, by management unit.

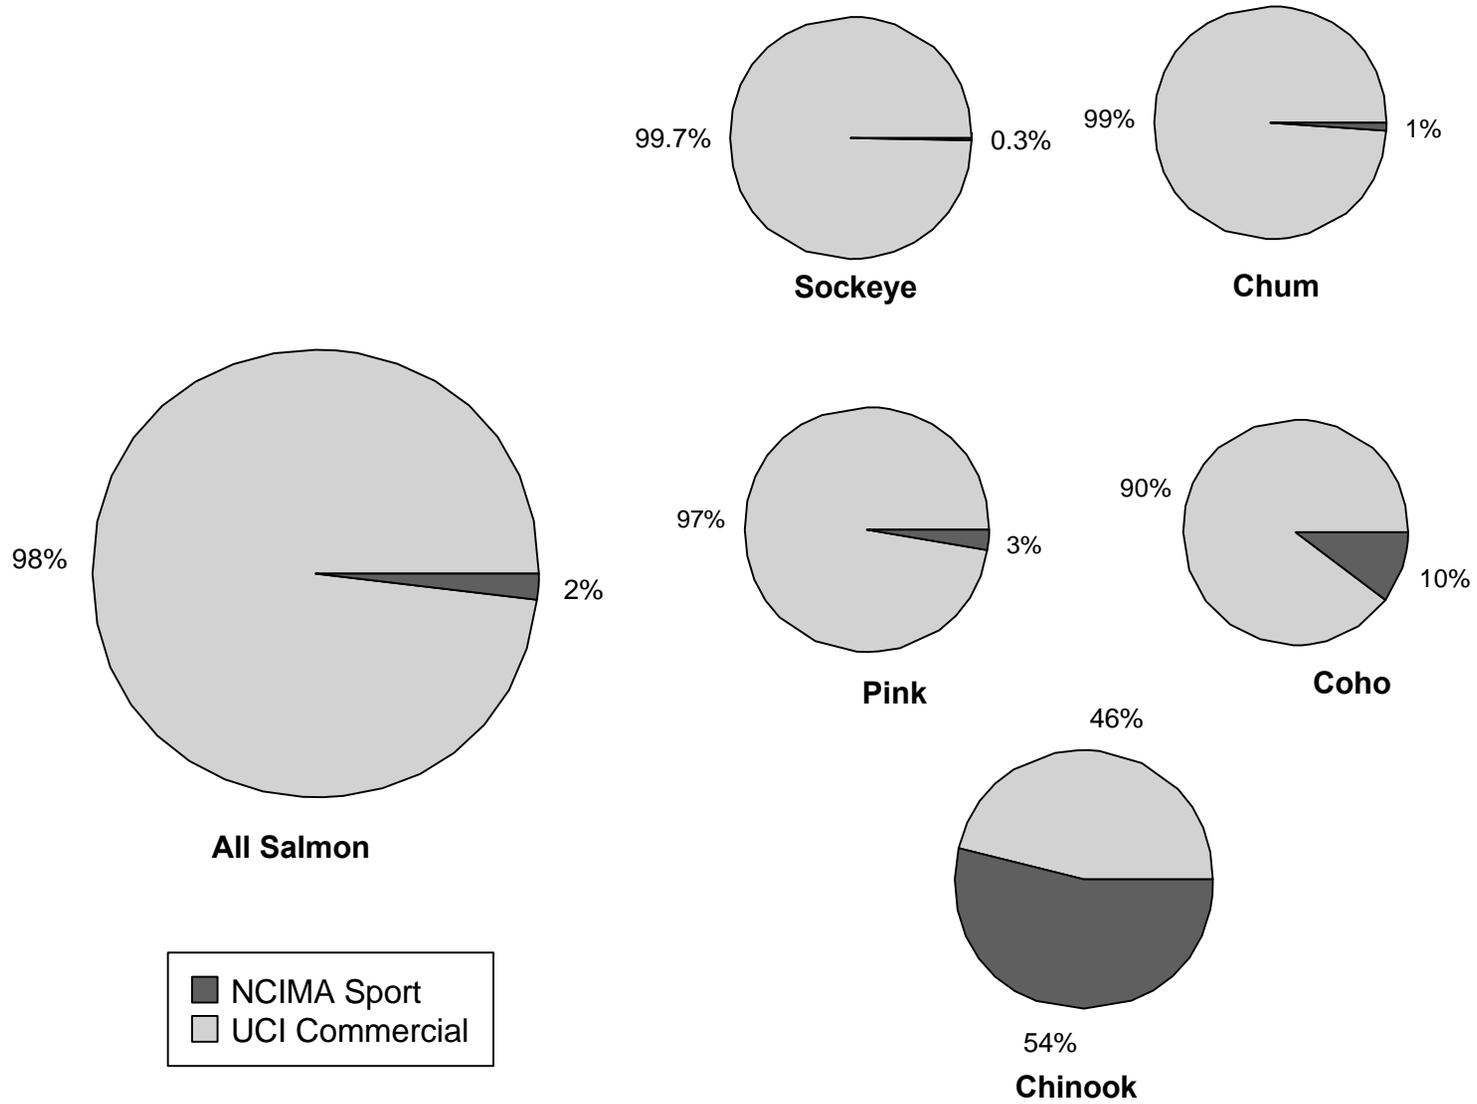

Figure 10.-Composition of the Northern Cook Inlet salmon harvest, 1977-1998.

Fish stocks of NCIMA are also harvested in the Tyonek subsistence fishery, Fish Creek personal use dip net fishery, Upper Yentna River subsistence fish wheel fishery, and by educational fishery permits issued to the villages of Eklutna and Tyonek, and the Knik Tribal council. The harvest by these fisheries on wild stocks is relatively low when compared to recreational and commercial harvests.

### ECONOMIC VALUE OF SPORT FISHERIES

The most recent estimate available to assess the economic value of the NCIMA recreational fisheries was conducted in 1986 (Jones and Stokes Associates, Inc. 1987). The economic value of the sport fisheries of the NCIMA was estimated to be approximately 29 million dollars (Table 15). This compared to an estimated value of 127 million dollars for Southcentral Alaska sport fisheries during 1986 (Jones and Stokes Associates, Inc. 1987). Resident anglers expended about 18.5 million dollars whereas nonresident anglers expended about 10.6 million dollars. Beginning in 1990 the annual number of nonresident sport fishing licenses sold has surpassed the number of resident licenses (Howe et al. 1999). Nonresident licenses accounted for 58% of all sport fishing licenses in 1997 and probably presently represent more than 50% of the value of the sport fisheries.

The Jones and Stokes survey also provided estimates of the direct expenditures for selected NCIMA fisheries (Table 16). These data indicate that considerable variability exists in amount of money expended by anglers, depending upon the species and location fished. Generally, anglers spent more money fishing for chinook and coho salmon than for hatchery-reared fish stocked into lakes. Anglers also expended more money fishing remote locations than road-accessible locations. It is likely that cost per angler-day has increased substantially (15%-25%) during the decade and a half since this report was completed.

**Table 15.-Estimated economic value of NCIMA sport fisheries during 1986.**

## **ONGOING RESEARCH AND MANAGEMENT ACTIVITIES**

The following are the major research programs being initiated, ongoing, or being curtailed in the NCIMA:

1. Escapement studies to assess returns of chinook and coho salmon in selected Northern Cook Inlet streams;
2. Creel and escapement studies to assess Willow Creek chinook salmon hatchery enhancement;
3. Assessment of Willow Creek wild and hatchery chinook salmon marine interception and inriver return;
4. Assessment of the return of chinook and coho salmon to the Deshka River;
5. Evaluation of marine interception of NCI chinook salmon based on coded wire tagged recoveries of hatchery Ship Creek stocks and wild Kenai River stocks;
6. Escapement studies to assess returns of coho salmon to the Little Susitna River, Cottonwood, Wasilla and Fish creeks;
7. Evaluation of the effects of regulations requiring slot limits for northern pike harvest in Alexander and Trapper lakes;
8. Willow Creek rainbow trout evaluation studies;
9. Distribution, abundance, movement, food preference and length composition studies of northern pike in the Susitna River drainage; and
10. A multiagency project to evaluate the aquatic resources of the Cottonwood Creek drainage. Work includes documentation of the fish habitat, riparian vegetation and manmade alteration within the 75-foot Matanuska-Susitna Borough's building set back, salmon escapement evaluation by weir, and evaluation of fish spawning distribution and coded wire tagging of coho salmon smolt. In addition, the United States Geological Survey (USGS) is monitoring water flow and stage and will analyze water nutrients.

We anticipate that emphasis among these programs will change over time, with programs being reduced or curtailed as findings are obtained and as new priorities are established.

Routine management activities that occur in the NCIMA include:

1. Participation in the BOF process,
2. Fishery monitoring and inseason fishery management,
3. Involvement with the public regarding fishery issues,
4. Enforcement of fishing regulations and providing regulatory signs,
5. Habitat monitoring and permit review,
6. Evaluating stocked lakes and assisting with annual fish stockings,
7. Aquatic education, and
8. Providing input on public access issues.

## **MAJOR BIOLOGICAL AND SOCIAL ISSUES FOR NCIMA**

There are several major biological and social issues associated with the NCIMA that affect area fisheries. Issues of importance that were discussed in the 1993-1996 area management reports (AMR) for recreational fisheries of Northern Cook Inlet (Whitmore et al. 1994-1996, Whitmore and Sweet 1997) are:

1. Willow Creek State Recreational Area,
2. Timber development,
3. Improved or expanded access,
4. Development of coal reserves,
5. Allocation,
6. Regulation enforcement,
7. Susitna River Basin Recreation Rivers Management Plan (ADNR 1991),
8. Little Susitna River coho salmon stocking and weir operation, and
9. The effects of an increasing population on a finite resource.

Current issues which affect NCIMA fisheries are included within Section II, Major Fisheries Overview.

## SECTION II: MAJOR FISHERIES OVERVIEW

### CHINOOK SALMON FISHERIES

Chinook salmon runs to the NCIMA collectively comprise the largest stock of this species within the entire Cook Inlet drainage. Within the management area, the Susitna River supports the largest stock of chinook salmon. The Susitna River stock is considered to be the fourth most abundant in Alaska, smaller than only the Yukon, Kuskokwim and Nushagak river stocks (Delaney and Vincent-Lang 1992). Although estimates of total return are unavailable for Northern Cook Inlet chinook salmon (largely due to our inability to thoroughly estimate spawning escapement), the collective annual return is believed to number from 100,000 to 200,000 fish (Delaney and Vincent-Lang 1992).

Harvests of NCI chinook salmon varied from 11,000 to 70,000 from 1893 through 1940, averaging about 38,500 fish (Table 17). This harvest level of Northern Cook Inlet chinook salmon appears to be sustainable, considering it was maintained for over a half century. After harvest levels increased from 1940 to 1952 to an average of 84,500 annually, a steady decline in harvests occurred until fisheries were closed to allow stocks to rebuild (Figure 11). This history suggests that the maximum sustainable harvest range for NCI chinook salmon is between 38,500 and 70,000 fish.

In 1976, the Magnuson Fishery Conservation and Management Act was established. This act, sometimes known as the 200-mile limit law, extended federal fishery management authority into waters within 3 to 200 miles from the United States coast. Its effects on Cook Inlet chinook salmon are not fully understood; however, it seems likely that the act and its associated fishery management plans increased chinook salmon returns to NCI.

The chinook salmon returns to the NCIMA have historically been harvested by a variety of users including recreational, commercial and subsistence/personal use fishermen (Table 18). However, harvest strategies for NCI chinook salmon have changed substantially since the 1890s. The fishery has slowly evolved from a mixed-stock commercial harvest to a recreationally-dominated harvest that targets a multitude of discrete substocks. A detailed user history is documented in Whitmore et al. 1993.

Beginning in 1975 and continuing through 1990, recreational fisheries targeting the NCI chinook salmon runs were gradually expanded to allow use of increasing returns. These expansions have been guided by the Upper Cook Inlet Salmon Management Plan adopted as policy by the Alaska Board of Fisheries in 1977. This plan (5 AAC 21.363), as it relates to NCI chinook salmon stocks, originally stipulated that those stocks normally moving through Upper Cook Inlet to spawning grounds prior to July 1 are to be managed primarily for recreational uses. Therefore, recreational fisheries were expanded and currently constitute the largest harvests. In 1986 the Alaska Board of Fisheries adopted the Northern District King Salmon Management Plan (5 AAC 21.366). This step-down plan allows for a harvest up to 12,500 chinook salmon by a commercial setnet fishery in the Northern District during June. The plan was adopted to allocate a portion of the increasing NCI chinook salmon returns to the commercial fishery.

Under these plans, total harvest of NCI chinook salmon increased through 1993 with harvests during 1986 through 1993 ranging from 40,300 to 54,200 (Table 17). Mean and peak harvest of NCIMA chinook salmon in recreational fisheries from 1986 through 1993 are 34,591 and 49,287

**Table 17.-Estimated harvests, by all user groups, of chinook salmon of Northern Cook Inlet origin, 1893-1998.**

<sup>d</sup> Northern District total.

fish, respectively (Table 7) (Mills 1987-1994). Sport harvests since 1993 have decreased substantially. Mean and peak harvest from the Northern District commercial fisheries, which harvest chinook salmon bound for NCIMA streams, during 1986 through 1993 are 9,753 and 15,488 fish, respectively (Appendix B5). Catch sampling of the Northern District setnet fishery in 1999 resulted in an estimated 4% contribution of Upper Cook Inlet released hatchery fish (Appendix B11). It is presently unknown how this contribution relates to overall contribution of specific NCIMA wild stocks to the Northern District setnet fishery.

In response to development of a recreationally-dominated harvest that targets a multitude of discrete substocks, biological escapement goals (BEG) have been established for 18 NCIMA chinook salmon spawning streams (Table 19). These goals were based on average long-term escapement levels and are intended to assure the long-term viability of NCIMA chinook salmon stocks. Spawning escapement is indexed annually using helicopter surveys and weirs. The combined aerial survey escapement goal for NCIMA is 34,250 chinook salmon; however, each of the 18 streams is evaluated according to their individual escapement and corresponding goal. From the late 1970s through 1989, escapement objectives were achieved. However, beginning in 1990, observed spawning escapements in selected streams decreased and the combined escapement goal for NCIMA was not achieved during 1992-1995.

In response to returns below escapement goals, action was taken through emergency orders and regulations to reduce harvest levels. As a result of this action the combined harvest of NCI chinook salmon was reduced to approximately half of the 1993 peak harvest (Table 18). Emergency orders that have modified regulations for these fisheries since 1991 are outlined in Appendix D. The regulation history of chinook salmon in Northern Cook Inlet waters is outlined in Appendix E.

Regulations providing for subsistence fisheries and personal use fisheries have changed in recent years as a result of BOF and court actions. Currently there are two subsistence fisheries, two personal use fisheries and three educational fisheries authorized in the NCIMA. Since 1980 a subsistence set gillnet fishery has been authorized at the village of Tyonek as a component of the Upper Cook Inlet Salmon Management Plan. This fishery is presently regulated by a 4,200 chinook salmon harvest quota; however, the annual harvest has never exceeded 2,800 chinook salmon (Table 20). In addition, the Upper Cook Inlet Subsistence Salmon Management Plan allowed a set gillnet fishery along the west side of northern Cook Inlet extending to Fish Creek during 1985, 1991, 1992 and 1994 (Table 21). In 1995 the BOF, in response to court action closing the fishery, allowed a personal use set gillnet fishery in place of the existing subsistence fishery. The BOF during the March 1996 meeting rescinded this fishery. The Yentna River Subsistence Salmon Fishery allows the taking of salmon with a fish wheel in the Yentna River downstream of the Skwentna River to Martin Creek. This fishery was implemented as a personal use fishery during the 1996 season. Prior to the 1998 season Supreme Court and BOF action changed this fishery to a subsistence fishery. The Fish Creek Personal Use Fishery currently provides the area's only personal use salmon fishery opportunity. The harvest of chinook salmon is prohibited in both of these fisheries. Educational permits have been issued to the native villages of Eklutna and Knik since 1994 and Tyonek in 1998 to fish salmon of all species. Annual harvests of 0-42 chinook have been reported.

<sup>a</sup> Number of permits returned for early/late season.

<sup>b</sup> Number of permits returned/number of permits issued.

<sup>c</sup> In 1995 the subsistence fishery was replaced with a personal use fishery.

A marine recreational fishery has developed in recent years along the eastside beaches of the Kenai Peninsula (Deep Creek, Ninilchik and Whiskey Gulch area) which targets mixed stocks of early-run chinook salmon. Contribution of specific stocks to these mixed-stock harvests is unknown, but recent tagging studies have shown that a portion of this harvest is made up of fish bound for NCIMA waters. NCI chinook salmon may also be harvested in the Lower Cook Inlet recreational fishery and a multitude of commercial fisheries (Appendix B10). Federally managed groundfish commercial fisheries catch chinook salmon as incidental bycatch, but numbers and streams of origin of these fish are largely unknown (Lafferty et al. 1998).

### **Recent Board of Fisheries Actions**

A summary of BOF actions beginning with 1992 is included in Appendix F.

During the February 1999 BOF meeting the following regulations were adopted:

1. The Deshka River will be open to king salmon fishing from its mouth upstream to Chijuk Creek a distance of approximately 19 river miles from January 1 to July 13. Other area regulations apply such as a one fish per day bag and possession limit, a five fish seasonal limit, and once an angler harvests his or her king they must quit fishing for king salmon the remainder of the day. Additionally, fishing is allowed only between the hours of 6:00 a.m. to 11:00 p.m., no bait is allowed, and guides cannot fish while guiding clients.
2. The area open for retention of king salmon on Alexander Creek was extended from its mouth upstream to Trail Creek. This provides anglers with an additional 11 miles of stream from the 1997 and 1998 seasons in which they may harvest king salmon on Alexander Creek.
3. The Theodore River was opened to catch-and-release fishing for king salmon from January 1st through June 30th, only single hook artificial lures will be allowed. Other West Cook Inlet Area Regulations apply as follows: fishing is allowed only between the hours of 6:00 a.m. to 11:00 p.m., bait is prohibited, and guides cannot fish while guiding.
4. There will be increased fishing opportunities for the road accessible Parks Highway streams (Eastside Susitna River tributaries) during the early part of June. The Parks Highway streams (Eastside Susitna River tributaries) will open to king salmon fishing from January 1st through the third Monday in June and for the next two consecutive 3-day weekends. This regulation identifying the fishing season is consistent with that on Willow Creek.
5. On the Little Susitna River, anglers will be allowed to use treble hooks year-round downstream of the Parks Highway Bridge. Existing bait restrictions were modified to allow the use of bait during the month of September.
6. The area open to king salmon fishing on the Kashwitna River was extended from its mouth upstream to the Parks Highway Bridge, a distance of 2 miles. The Kashwitna River, a Parks Highway stream, will be regulated under the new season regulation implemented for the Parks Highway streams.
7. In all waters of the Westside-Susitna River and West Cook Inlet Management Areas (excluding waters between the Deshka River and the Talkeetna River mouths), anglers will be allowed to continue to fish for king salmon (catch-and-release) once they have harvested their limit excluding Alexander Creek, Lake Creek, Deshka River, Fish Lake Creek and Clear

Creek. In these streams you will be required to quit fishing for king salmon for the day once you have harvested your limit.

### **Management Strategy**

The management strategy for NCI chinook salmon has been established through the Board of Fisheries process. Established management plans that address user allocation and specific regulations have been adopted for each fishery. Action has been taken through the BOF regulatory process since 1994 to reduce the chinook salmon harvest in an effort to achieve biological escapement goals. Following the 1994 season the goal of reducing the harvest potential succeeded in reducing the recreational harvest by half, providing for a harvest of less than 20,000 fish. This goal has been modified with elimination of a minimum harvest objective. The primary goal remains to achieve the BEGs. General area restrictions that have been established to reduce harvest potential are reduction of daily and seasonal bag limits, areawide bait prohibition, and reduction in time and area open to fishing. Streams which consistently fall short of escapement goals are closed to chinook salmon fishing. On streams with weirs or programs in place that provide inseason sport harvest information, regulations may be liberalized if harvestable surpluses are projected.

### **Knik Arm Unit Chinook Salmon Fishery**

#### **Background and Historical Perspective**

The Little Susitna River (Figure 12) is the only Knik Arm Management Unit stream currently open to the harvest of chinook salmon. It supports a major chinook salmon fishery as well as the largest coho salmon fishery in the NCIMA. Chinook salmon bound for the Little Susitna River are also harvested in the Upper Cook Inlet subsistence and personal use fisheries, the Northern District commercial fishery and possibly saltwater sport fisheries adjacent to the Kenai Peninsula.

Access to the Little Susitna River occurs at three primary locations: (1) intertidal waters of the river are accessed by boats crossing the marine waters of Knik Arm from the Port of Anchorage public boat launch, (2) the road-accessible Little Susitna Public Use Facility which includes a launch and campground, and (3) private and public launches near the Parks Highway which provide access to the upper reaches of the river. The Little Susitna Public Use Facility is by far the most heavily used access to the river. Power boats can travel from the mouth of the river to the Parks Highway during periods of moderate to high water levels. However, during low flows travel is restricted to smaller jet boats between River Mile 28 and the Parks Highway at River Mile 70.

Chinook salmon return to the Little Susitna River from late May through early July with the peak immigration approximately mid-June. Spawning occurs from the Burma Road area upstream into Hatcher Pass with the majority of spawning taking place upstream of the Parks Highway bridge. Few chinook salmon use tributaries for spawning. Peak spawning typically occurs during the last week of July.

Chinook salmon fishing is permitted from the river's mouth upstream to the Parks Highway, a distance of about 70 miles. The chinook salmon fishing season is from January 1 through July 13.

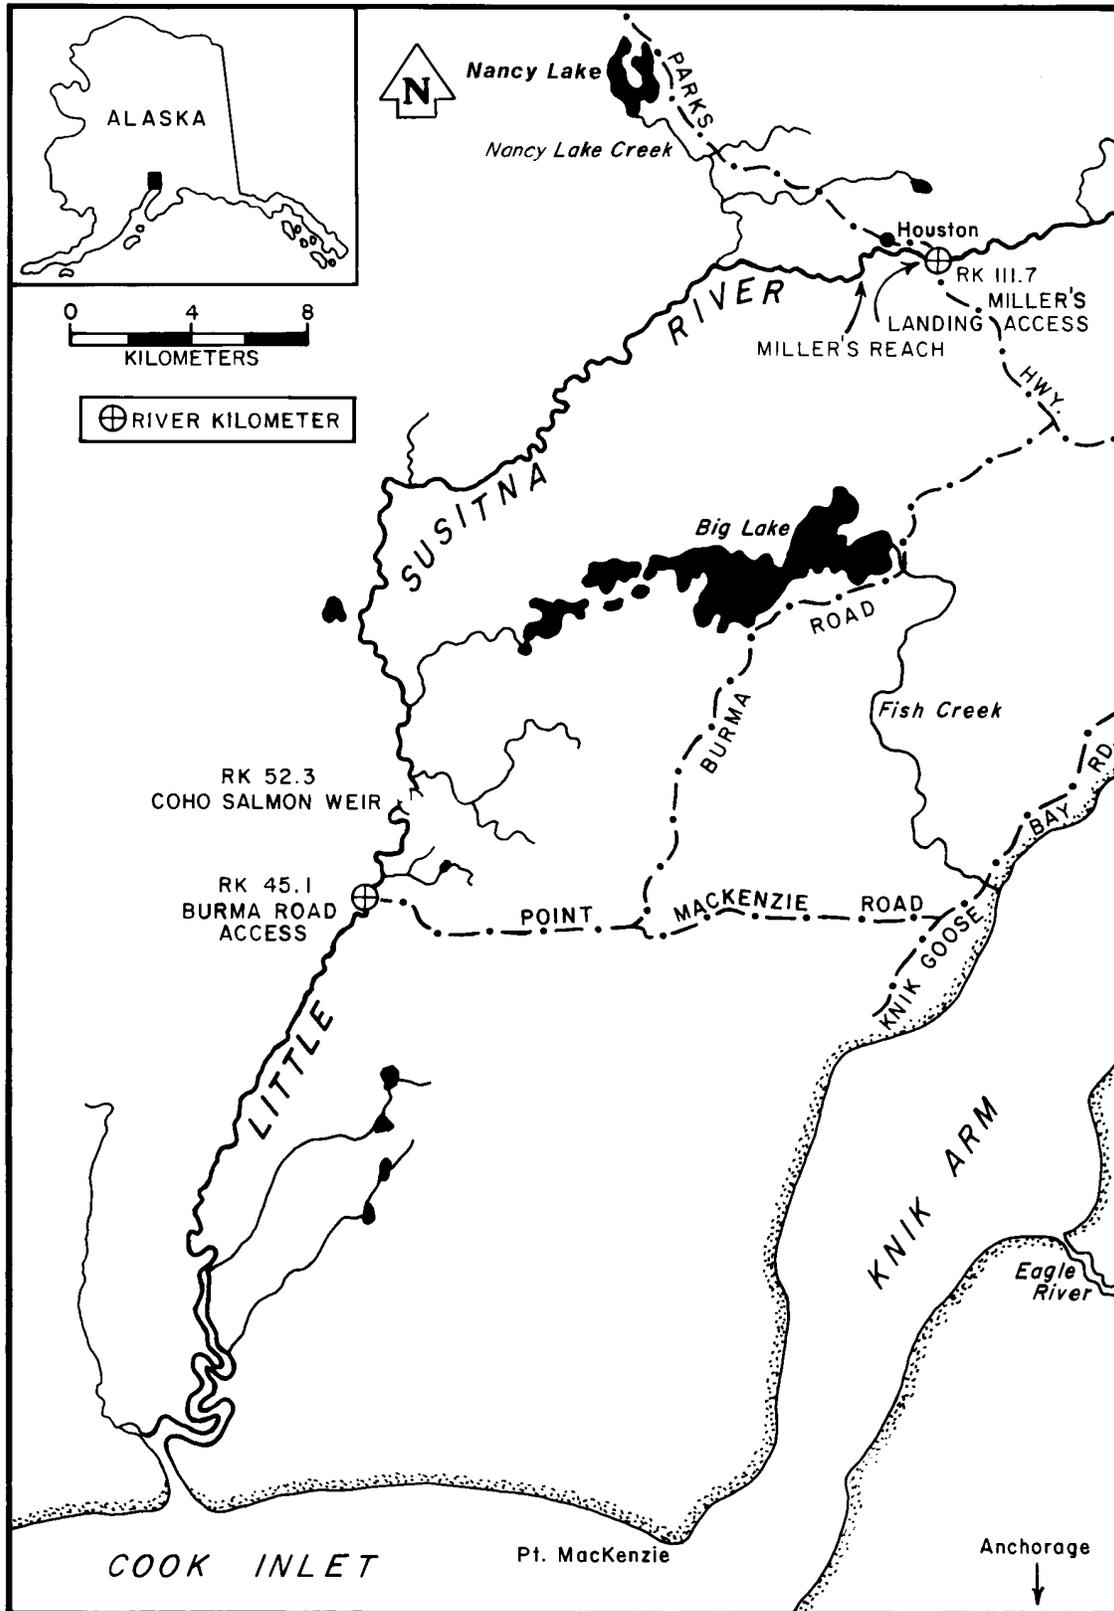

Figure 12.-Map of the Little Susitna River.

Inseason harvest and fishing effort for chinook salmon were estimated by onsite creel surveys from 1979 through 1990. Creel survey and SWHS estimates were found to produce comparable results; therefore, the creel survey program was discontinued in 1991. The average estimated annual harvest of chinook salmon from the Little Susitna River for the period 1979-1997 was approximately 2,200 fish (Figure 13, Appendix A3) (Mills 1979-1994 and Howe et al. 1995-1998).

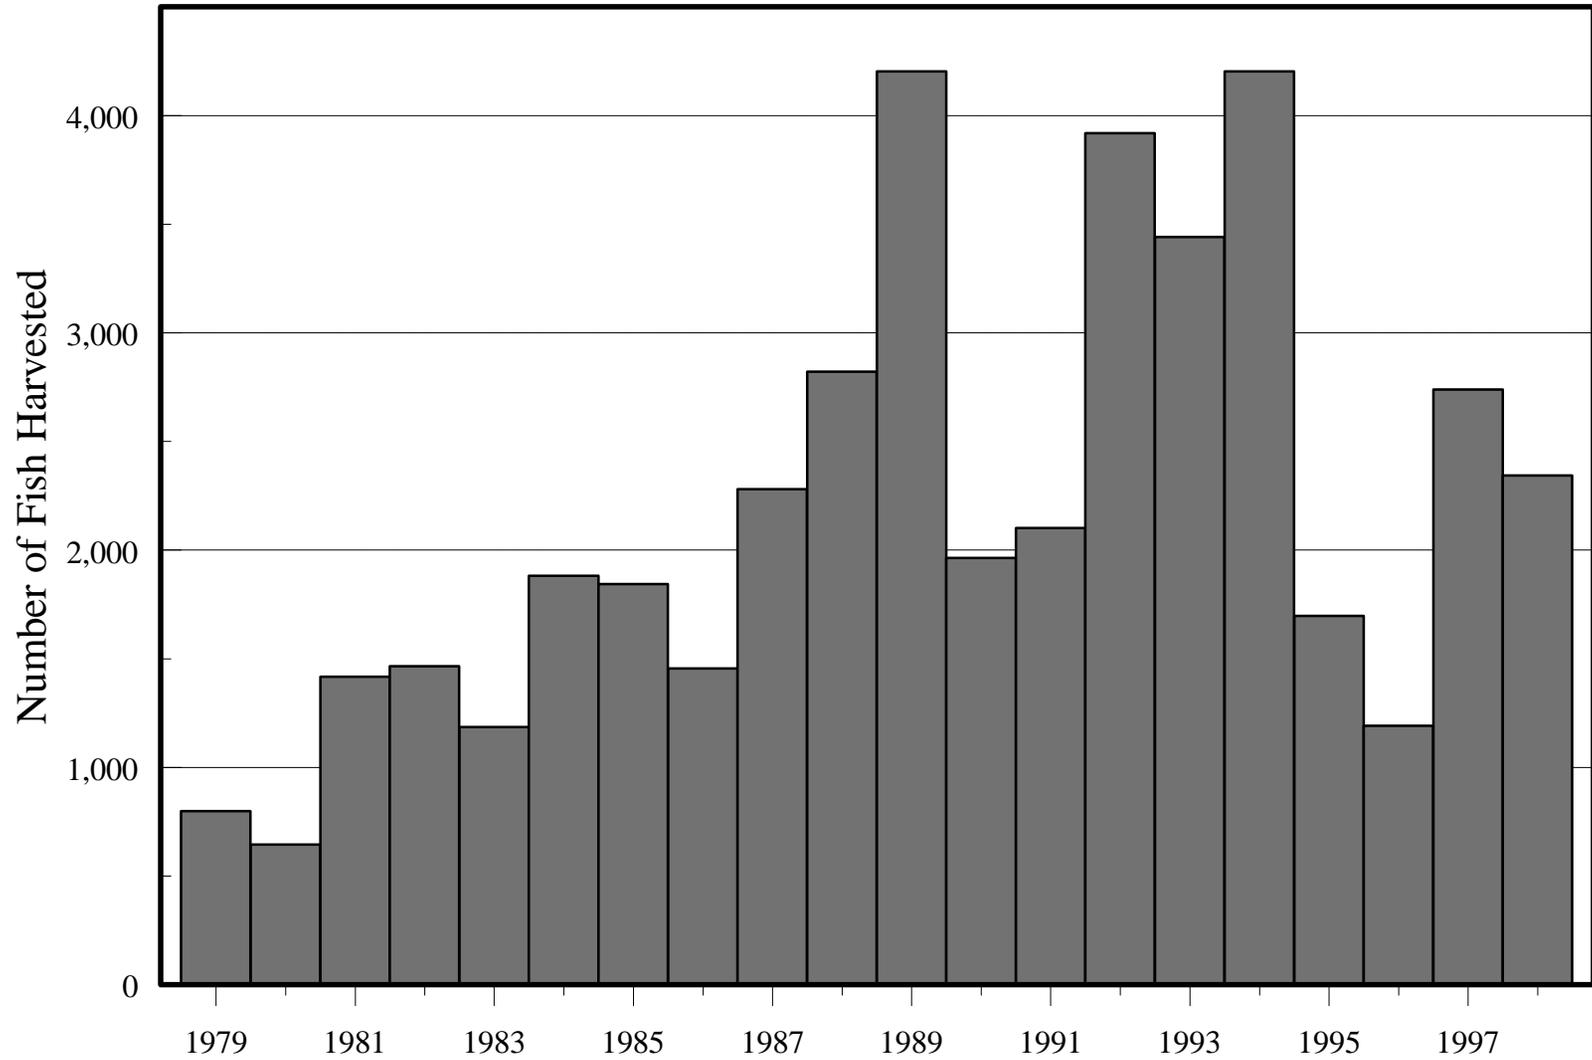

Due to the semiglacial character of the Little Susitna River, successful aerial survey counts of chinook salmon spawning areas cannot be conducted annually. Chinook salmon aerial escapement surveys were completed during 11 of the years from 1983 through 1998. The average chinook salmon escapement index during these years, based on aerial surveys, was 1,304 fish with a peak escapement count of 3,197 fish in 1988 (Table 22). During 1988, 1989, 1994 and 1995 a weir was operated and escapement counts ranging from 2,809 to 7,400 fish were obtained (Table 22).

In order to increase road accessible harvest opportunities and reduce angler impacts on the area's wild chinook salmon populations, the Eklutna Powerplant Tailrace was chosen as a chinook salmon stocking site in 1999. There is no wild chinook salmon return to these waters. The Eklutna Hydroelectric Power Plant Tailrace (Figure 14) is a recreational fishery that was originally supported by coho salmon returning to the Cook Inlet Aquaculture Association's (CIAA) hatchery located at the head of the tailrace. This nonprofit hatchery operated from 1981 through 1998. A fish ladder links the hatchery with the tailrace that in turn drains into the Knik River. Presently the coho fishery is supported by hatchery fish reared at the Fort Richardson Hatchery, an ADF&G facility, and released in the tailrace. The sport fishery is confined to the one-half-mile long tailrace. Coho, chum, and a few sockeye salmon are harvested by sport anglers within the tailrace. All but the terminal 100 yards of the tailrace are subject to preferential harvest rights by the Aquaculture Association. Salmon of Knik River drainage origin are also harvested at the confluence of the tailrace and the Knik River. The annual objective is to release 105,000 chinook smolt resulting in a return of 2,000 adults, generating 10,000 angler-days of effort directed at these fish. Moose Creek wild chinook salmon will be used as brood stock annually (ADF&G *Unpublished*).

### **Recent Fishery Performance**

The 1998 sport harvest of chinook salmon from the Little Susitna River was 2,344 fish (Howe et al. 1999), approximately equal to the 1993-1997 average of 2,655 fish (Appendix A3). The Little Susitna River harvest accounted for approximately 9% of the total chinook salmon harvest from NCIMA waters during 1998 (Table 7 and Appendix A3).

High waters on the Little Susitna River created poor fishing conditions during most of the 1999 season. Some guides and anglers complained of the difficulty in catching fish in the high turbid water without the use of bait and requested that the department open the river to bait fishing. Bait remained prohibited and when water clarity improved a dramatic increase in sport catch and harvest was observed, indicating at least an average chinook salmon return was present. Unfortunately, during the time the department conducts its aerial escapement survey, the stream again became turbid making it impossible to conduct a survey. An aerial survey conducted on Moose Creek, a Knik Management Unit stream that is closed to chinook salmon fishing, counted 744 fish, indicating an above average (mean of 592 fish) return (Table 22).

### **Management Objectives**

The Little Susitna River biological escapement goal (BEG) was set at 850 fish (Table 22). It is based on the average of aerial survey index counts of spawning chinook salmon. The management objective is to maximize fishing opportunity while insuring the attainment of the BEG. During 1988, 1989, 1994 and 1995, years in which a weir program was conducted and harvest estimates are available, inriver exploitation rates were estimated at approximately 28%, 49%, 59% and 38%, respectively. This indicated an increased rate of exploitation from 1988 to 1994, which, if allowed to continue could lead to stock conservation concerns. This trend was reversed in 1995 primarily through reduction in fishing hours and implementation of a bait prohibition.

### **Recent Board of Fisheries Actions**

During the February 1999 BOF meeting the only regulation adopted concerning the Little Susitna River allowed anglers to use treble hooks year-round downstream of the Parks Highway Bridge. Previously they were not allowed September 1 through May 31.

The next BOF meeting concerning the Little Susitna River chinook salmon is scheduled for 2002.

### **Current Issues**

There are several issues confronting the fishery resources of the Little Susitna River and the users of these resources. These issues include: (1) proposed extension of the South Big Lake Road to the Little Susitna River at River Mile 39.5, (2) use restrictions associated with habitat issues such as streambank erosion within the State Game Refuge, (3) safety issues associated with shore anglers and boat traffic, (4) horsepower restrictions, and (5) concerns including user fee rates and overnight boat mooring facilities for guide boats and the lack of Park Ranger presence at Little Susitna River Public Use Facility.

Following a series of public meetings, the daily boat launch and parking fee will be increased from \$5 to \$10 per day. The seasonal boat launch and parking fee will be increased from \$75 to \$150 per year for private users and from \$150 to \$300 per year for commercial users. In response to numerous complaints concerning the lack of Park Ranger presence, \$25,000 of boating access monies will be used to fund a position.

A discussion of the Recreation Rivers Act and use restrictions within the State Game Refuge is provided in Whitmore et al. 1996. A discussion of the South Big Lake Road extension is provided in Whitmore et al. 1993.

Chinook salmon harvest in the Little Susitna River increased considerably from 1979 to 1989 (Appendix A3) creating a concern of overexploitation. During 1992 through 1994 large harvests and increased exploitation rates occurred. The implementation of restrictions prior to the 1995 season (mainly the prohibition of bait) reduced the chinook harvest considerably during 1995 and 1996. The addition, in 1997, of a regulation that does not allow fishing for the remainder of the day after the harvest of a chinook salmon over 16 inches has helped stabilize harvest at an acceptable level.

### **Ongoing Research and Management Activities**

An aerial index survey is conducted annually to determine chinook salmon spawning escapement. Harvest and catch are estimated with the SWHS.

The Little Susitna River Public Use Facility (LSPUF) lies within the Susitna Flats State Game Refuge and is owned by ADF&G. The Department of Natural Resources, Division of Parks and Outdoor Recreation (DPOR), operates the LSPUF under a cooperative agreement with the ADF&G. This cooperative agreement is included in Appendix J.

In order to increase road-accessible harvest opportunities and reduce angler impacts on the area's wild chinook salmon populations, the Eklutna Tailrace was chosen as a chinook salmon stocking site. The annual objective is to release 105,000 smolt resulting in a return of 2,000 adult chinook salmon, generating 10,000 angler-days of effort directed at these fish. Moose Creek wild chinook salmon will be used as brood stock annually. The first smolt release is scheduled to occur in May 2001.

### **Recommended Research and Management Activities**

Aerial surveys should be conducted annually to index numbers of spawning chinook salmon. Increased regulation enforcement is recommended to address complaints received from anglers concerning the observed use of bait during the king salmon fishery.

Continued access maintenance and development is necessary for the Little Susitna River chinook salmon fishery. An important boating access project is the operation of the Little Susitna Public Use Facility by Division of Parks and Outdoor Recreation. Additional access programs that are either being implemented or proposed for the Little Susitna River include: upgrading trails adjacent to the Little Susitna Public Use Facility to reduce habitat degradation, conducting bank stabilization projects, and hardening camp sites along the river.

Continuation of the development of the Eklutna Tailrace chinook salmon stocking program is recommended.

## **Eastside Susitna Management Unit Chinook Salmon Fisheries**

### **Background and Historical Perspective**

The Eastside Susitna Management Unit includes all drainages of the Susitna River downstream of the Oshetna River to the confluence of the Chulitna River and drainages which flow into the Chulitna River from the east, and those drainages which flow into the Susitna River from the east between the Talkeetna and Deshka rivers (Figure 1). The Eastside Susitna Management Unit is composed of three distinct geographical areas with different regulations. These areas include: (1) the eastside Susitna River tributaries between the Deshka and Talkeetna rivers, (2) the Talkeetna River, and (3) the upper Susitna area which includes the Susitna River and all tributaries upstream of the confluence with the Chulitna River to the Oshetna River, including the Oshetna River drainage. Regulations governing eastside Susitna River fisheries since chinook salmon fishing reopened in 1979 are summarized in Appendix E.

Many clearwater tributaries enter the Susitna River from the east between its junction with the Deshka River upstream to the Talkeetna River. The majority of the fisheries in this portion of the management unit are accessible by paved road. There are, however, exceptions, including Little Willow and Greys creeks and various Susitna River side sloughs that require use of a boat to access their most productive portions. The George Parks Highway (Alaska Route 1), which connects Anchorage and Fairbanks, parallels the Susitna River on the east. The Alaska Railroad also parallels the east side of the Susitna River to a large extent. Both transportation systems provide angler access to numerous tributaries. Waters of this area within one-quarter mile of the Susitna River (except Parks Highway streams) are open to chinook salmon fishing each Saturday,

Sunday and Monday for 4 consecutive weeks beginning the second Saturday in June. Major fisheries occur in Willow, Little Willow, Caswell, Sheep, Goose and Montana creeks (Figure 15). Each of these fisheries extend from the Susitna River upstream to the Parks Highway, except Montana Creek which extends one half mile upstream of the Parks Highway bridge. They are open to chinook salmon fishing from January 1 through the third Monday in June and then reopen on a Saturday through Monday basis for 2 consecutive weeks beginning the fourth Saturday in June.

The Talkeetna River joins the Susitna River about 98 miles upstream from Cook Inlet. This glacial system contains two major and numerous minor clearwater tributaries that support chinook salmon (Figure 16). Clear Creek is the most prominent chinook fishery within the Talkeetna River drainage. The Talkeetna Spur Road provides access to the Talkeetna River; however, a boat is required to reach virtually all chinook salmon fisheries within the drainage. This area is primarily accessed from the Talkeetna boat launch.

The Talkeetna River and upper Susitna River drainages are open to chinook salmon fishing from January 1 through July 13. The upper Susitna River area (Talkeetna to Devil's Canyon) is accessible only by boat or railroad. A public boat launch adjacent to the community of Talkeetna provides access to the area. Boat travel is relatively safe from the Talkeetna River upstream to the entrance of Devil's Canyon, a distance of about 55 miles. Boat travel beyond the entrance to Devil's Canyon is extremely hazardous and few boat operators venture past this location. Indian River and Portage Creek are the most prominent chinook salmon fisheries within the Upper Susitna River Area. The entrance to Devil's Canyon, beyond which salmon can not migrate, is about 150 miles upstream from Cook Inlet. The portion of the Susitna River above the Talkeetna River is designated as a trophy fishery for rainbow trout; therefore, only unbaited, single-hook artificial lures are permitted as terminal gear.

Through 1994 the bag and possession limit for chinook salmon in all Eastside Susitna Management Unit fisheries was one chinook salmon per day and two in possession, 16 inches or more in length. In 1995 the bag and possession limits were reduced to one per day.

During 1993 to 1997, the Eastside Susitna Management Unit fisheries have collectively provided approximately 50% of the chinook salmon harvest from the NCIMA. The harvest has ranged from 7,872 to 22,688 during this period (Table 23) with 1992 and 1993 harvests doubling all previous years (Appendix A5). Included in this harvest are hatchery fish taken in Willow Creek, which totaled approximately 1,000 to 4,000 fish annually.

Aerial survey escapement counts of Eastside Susitna Management Unit chinook salmon stocks suggest that these substocks comprise from 40% to 60% of the Susitna River chinook salmon escapement (Tables 23 and 24). Prairie Creek, a headwater tributary of the Talkeetna River, consistently receives the largest escapement which has ranged between 2,254 and 9,463 from 1987 through 1998 (Table 24).

Willow Creek, Talkeetna River, Sheep Creek and Montana Creek traditionally produce the largest harvest of chinook salmon in the Eastside Susitna Management Unit. The 1993-1997 average annual harvest for these fisheries ranged from 1,250 fish in Sheep Creek to 4,616 fish in Willow Creek (Appendix A5). Tagging studies have shown that these chinook salmon substocks

are subject to harvest at stream mouths other than their natal stream (Peltz and Sweet 1992). For example, stocks from the upper portions of the drainage such as Prairie Creek are harvested at stream mouths along their migration corridor. The magnitude of nonnatal stream harvest has not been defined.

Few chinook salmon arrive at the mouths of Eastside Susitna Management Unit tributaries between the Dshka and Talkeetna rivers prior to mid-June. The third and fourth weekends in June generally provide the majority of the harvest. Very few chinook salmon arrive at the Talkeetna River prior to June 20, with the fishery peak occurring the first week in July. The Upper Susitna River fishery has run timing similar to the Talkeetna River.

Creel surveys were employed from 1979-1989 to monitor the effort for and harvest of chinook salmon and to collect biological samples at Willow Creek, Montana Creek, and the Talkeetna River. Creel surveys were continued on Willow Creek through 1993 and again in 1995. Additionally, in 1991, 1992 and 1995 creel surveys were conducted for the Talkeetna River. Biological samples were collected from the Talkeetna River during the 1993, 1994 and 1996

seasons and are annually collected at Willow Creek. No harvest estimates are collected during this time. Creel surveys were intermittently conducted at Sheep, Goose, Caswell, Little Willow, Sunshine, and Birch creeks and within the upper Susitna River area. Findings from these surveys have been documented in Department of Fish and Game annual reports (Watsjold 1980, 1981; Bentz 1982, 1983; Hepler and Bentz 1984-1987, Hepler et al. 1988 and 1989, Sweet and Webster 1990, Sweet et al. 1991, Peltz and Sweet 1992 and 1993, Sweet and Peltz 1994, Whitmore et al. 1995-1996, Whitmore and Sweet 1997-1999).

<sup>e</sup> Biological escapement goal.

Willow Creek was identified in 1981 as a candidate for chinook salmon stocking in the Cook Inlet Regional Salmon Enhancement Plan (CIRPT 1981). A chinook salmon smolt stocking program was initiated in 1985, and with the exception of 1987, the program has continued annually (Table 25). The goals of this program are to: (1) maintain the present quality and quantity of natural chinook salmon production, (2) produce through supplemental hatchery production an additional 6,000 returning chinook salmon of which 4,000 would be available for harvest at Willow Creek on an annual basis, and (3) provide 10,000-15,000 angler-days of chinook salmon fishing opportunity during king salmon season (Sweet 1999).

### **Recent Fishery Performance**

The 1998 chinook salmon harvest from the Eastside Susitna Management Unit was 12,232 fish (Table 9 and Appendix A5), approximately 90% of the 1993-1997 mean harvest of 13,164. This harvest represented approximately 50% of the entire chinook salmon harvest from the NCIMA (Table 23). In total, 35,857 chinook salmon were caught in the Eastside Susitna Management Unit during 1998, of which 66% were released (Table 13). The harvest estimate for 1998 includes approximately 1,000 hatchery fish taken in the Willow Creek fishery.

During 1998 the harvest of chinook salmon from Willow Creek, Talkeetna River, and Montana Creek was 3,254 (approximately 1,000 hatchery produced), 4,422 and 1,792 fish, respectively, which accounted for the majority of the total harvest from the Eastside Susitna Management Unit (Appendix A5).

A catch sampling program to estimate the relative contribution of hatchery-produced chinook salmon to the sport harvest is conducted at the mouth of Willow Creek annually. An escapement survey to estimate hatchery contribution is also conducted. During 1999 hatchery fish accounted for 49% of the harvest, 6% of the escapement in the mainstem of Willow Creek above the confluence of Deception Creek, 73% of the Deception Creek escapement collected during the egg take and 20% of the Deception Creek escapement below the egg-take weir (Table 26). During 1989-1999 the hatchery contribution to the sport harvest averaged 41%. The annual chinook salmon egg take at Deception Creek resulted in 792,214 eggs collected during 1999 (Table 27).

In order to reduce the chance of hatchery fish mixing with nonhatchery mainstem Willow Creek fish, a new stocking location was established in Deception Creek approximately 6 miles upstream at the egg take weir site. The original release site was in Deception Creek approximately 100 yards upstream of its confluence with Willow Creek. The first release at the new site occurred in 1996 and the 2001 return will be the first return year consisting of releases entirely from the upstream Deception Creek release site. Beginning in 1996, 100% of hatchery-released fish were adipose finclipped and implanted with a CWT. This allowed the identification of all hatchery-reared fish during egg take so they would not be used as brood stock for future Deception Creek release. The first year in which all returning hatchery-reared fish are marked will be 2001. A detailed summary of the performance of the chinook salmon enhancement program in Willow Creek is available which includes information from initiation of the program through the 1996 season (Sweet 1999).

In association with this project the age, sex and size composition of the harvest was determined (Table 28). In 1999 males accounted for about 50% of the Willow Creek sport harvest. Approximately 20% of the harvest was composed of age-1.2 fish, 37% age-1.3 and 42% age-1.4 fish. Escapement index counts in 1999 indicated a minimum of 3,081 spawners in Willow and Deception creeks combined (Table 24).

The 1999 season was extended for eastside Susitna River streams along the Parks Highway, allowing fishing daily through the third weekend in June. This regulatory strategy was implemented to provide additional angling opportunity early in the season when fewer fish are present, whereby increasing angler opportunity while only minimally increasing the number of chinook salmon harvested. Information provided to the department from recreational anglers and guides in concert with information obtained from the Willow Creek chinook salmon catch sampling program indicated that we were seeing an above average return of chinook salmon to eastside Susitna systems. In response, the department, by emergency order authority, extended the fishing season for the eastside Susitna River tributaries for an additional 3-day weekend.

The 1999 escapement indices for Eastside Susitna Management Unit chinook salmon totaled 24,306 fish with all streams except Goose Creek exceeding their BEG (Table 24). Surveys were completed in all index streams except Sheep Creek where turbid water made counting impossible.

### **Management Objectives**

Biological escapement goals for nine Eastside Susitna Management Unit streams have been established (Table 19). These escapement goals were based on historic escapement index counts.

**Table 28.-Sex and age composition and length-at-age of chinook salmon sampled from the Willow Creek sport harvest, Deshka River weir escapement and Northern Cook Inlet commercial harvest, 1999.**

Note: Less than 5% of the population consists of age classes other than those listed.

The management objective for these nine streams is to achieve the escapement goal within each system. In the streams which cross the George Parks Highway, management strategies provide maximum levels of sustained chinook salmon fishing opportunity while attaining escapement objectives. Objectives specific to Willow Creek relative to the chinook salmon enhancement program are to provide 10,000-15,000 angler-days of participation, and opportunity to harvest an additional 4,000 hatchery-produced chinook salmon.

In the upper Susitna River area, management strategies are in place to allow for sustained yield of trophy-size rainbow trout. Full utilization of chinook salmon within this area is not a primary objective.

## **Recent Board of Fisheries Actions**

During the February 1999 meeting the BOF adopted the following regulations:

1. The Parks Highway streams (East Side Susitna River tributaries) will open to chinook salmon fishing from January 1 through the third Monday in June and for the next two consecutive 3-day weekends. This regulation identifying the fishing season is consistent with that on Willow Creek.
2. The area open to chinook salmon fishing on the Kashwitna River was extended from its mouth upstream to the Parks Highway Bridge, a distance of 2 miles. The Kashwitna River, a Parks Highway stream, will be regulated under the new season regulation implemented for the Parks Highway Streams.

The next BOF meeting to include Eastside Susitna Management Unit chinook salmon is scheduled for 2002.

## **Current Issues**

The primary social issues in the Eastside Susitna Management Unit chinook salmon fisheries are associated with crowding, regulation violations, and the Recreation Rivers Act.

Regulations adopted by the BOF effective in 1999 allowing a longer chinook salmon season on the Parks Highway streams should help alleviate the crowding problem.

The decrease in spawning escapement during the period 1992-1994 is the primary biological issue confronting these fisheries. The increasingly restrictive regulations that have been implemented since 1993 have been successful in decreasing harvest and effort levels and increasing spawning escapement.

Conflict between power and nonpower boaters has become an issue at Willow Creek. Historically, few power boaters used Willow Creek as it is a narrow, winding, shallow creek that doesn't safely accommodate many boaters at the same time. Float trips and drop-off services have become popular with chinook salmon anglers, increasing the amount of interaction between power and nonpower boaters.

## **Ongoing Research and Management Activities**

Willow Creek has been the site of a chinook salmon stocking program since 1985. Inseason assessment of the biological characteristics of and hatchery contribution to the harvest and escapement continue to be important components in continuing Willow Creek as a responsible stocking program.

Annual assessment of escapement is an ongoing activity associated with the Eastside Susitna Management Unit fisheries. Results from escapement indices in conjunction with harvest data from the SWHS are the primary elements used to manage these fisheries.

Department personnel inspect anglers' fishing licenses and harvest records at several Parks Highway-accessible fisheries including Montana, Sheep, Goose and Willow creeks.

A juvenile chinook salmon coded wire tagging (CWT) program was operated at Willow Creek during 1996-1998. A total of approximately 300,000 wild juvenile chinook salmon have been tagged and released. Tagged fish are expected to enter marine waters in 1997-1999 and be available to harvest as immature fish beginning in 1998. The majority are expected to return to Willow Creek in the years 2000-2002 as 5- and 6-year-olds. Tag recoveries will occur as these

fish are intercepted in commercial, subsistence, personal use, and recreational fisheries. Catch sampling programs are conducted by the department in the Copper River, Kodiak, and Northern District commercial and Deep Creek marine recreational fisheries. A report detailing the CWT project will be available in 2000. Beginning in June 2000 a weir will be operated on Willow Creek for CWT recovery.

The department is responsible for the following public access facilities within this management unit:

1. A private concessionaire is contracted to oversee the operation of the Talkeetna River boat launching facility and perform routine maintenance. Fees are charged. In addition, the concessionaire is responsible for maintenance of pit privies installed near the confluence of the Talkeetna River and Clear Creek.
2. Maintenance at Sheep Creek is provided annually through contract with private maintenance companies. No boating access is available from this site. The parking and camping area provides anglers with access to the confluence of Sheep Creek and the Susitna River. Enhancements slated for this site include: extending the guardrail along a portion of the trail to curtail erosion caused by foot traffic, and installation of a foot/ATV ramp to allow access to a lower portion of the river bank. This is a no fee area.
3. The Caswell Creek parking and camping area provides anglers with access to the confluence of Caswell Creek and the Susitna River. No boating access is available at this site. The department has been granted management authority over a 30-acre tract, including this site, from Alaska Department of Natural Resources (ADNR). Contracts are established annually with local maintenance companies to maintain toilets, empty dumpsters, and provide general facility cleaning. During 1999 the access road was graded and hardened with gravel. This is a no fee area.
4. Susitna Landing is located at the confluence of the Kashwitna and Susitna rivers and can be reached by vehicle. Services provided at site include parking, boat launch and RV camping. Fees are charged. A contracted concessionaire operates the facility and performs routine maintenance with the department providing upgrades as needed. Current plans provide for dredging below the boat ramps, and installation of a fence for secure boat storage.

### **Recommended Research and Management Activities**

We recommend continuation of the assessment of the Willow Creek hatchery enhancement program and construction of a floating weir in Willow Creek in 2000 to assess the return of CWT chinook salmon.

A program should be initiated to assess the age composition of the return to the Susitna River. A database is available for past years and should be continued to increase our understanding of these stocks.

Aerial escapement surveys will be continued as they are our only indication of run strength in many streams. Enforcement activities should be continued to maintain contact with anglers and insure compliance with regulations.

Continuation of the access maintenance, development and land acquisition upgrades is necessary in the Eastside Susitna Management Unit. The Fisheries Access Improvement section gives a detailed summary of these projects.

Access projects that are underway or planned to be implemented during next season include: (1) continuation of site maintenance contracts for Sheep Creek and Caswell Creek, (2) participation of concessionaires at the Talkeetna boat launch and Susitna Landing, (3) upgrading the trail at Caswell Creek from parking area to the stream to reduce erosion, and (4) upgrading Susitna Landing boat launch, dock and walkway. Plans for future development include construction of a boat launch on the Chulitna River at Mile 133 of the Parks Highway.

The department is currently looking into the possibility of constructing a boat launch facility at the mouth of Willow Creek. This project is still in the planning stages and would require a feasibility study before being implemented.

## **Westside Susitna Management Unit Chinook Salmon Fisheries**

### **Background and Historical Perspective**

Tributaries that drain into the Susitna River from the west (Figure 17) supported the largest chinook salmon fisheries within the NCIMA through 1991. Access to the relatively remote fisheries in this area is primarily by boat or aircraft. Susitna Landing, located at the mouth of the Kashwitna River, and Dshka Landing, located about 4 miles upstream from the Dshka River, are the principal boat access sites on the Susitna River. A few anglers also gain access to Westside Susitna Management Unit fisheries by traversing Cook Inlet by boat from the Port of Anchorage. The Petersville Road provides the only vehicular access to this portion of the Susitna River drainage. This road allows access to the upper reaches of the Dshka River and Peters Creek.

The Yentna River, the largest tributary of the Susitna River, is within this management unit. This glacially turbid river flows into the Susitna River about 30 miles upstream from Cook Inlet.

The westside Susitna River chinook salmon fisheries supported the largest harvest of chinook salmon within the NCIMA until 1992 when the eastside Susitna River harvest surpassed it (Table 23). The Dshka River, Alexander Creek and Lake Creek have supported the largest chinook salmon fisheries in this management unit (Appendix A7). The collective harvest from these three fisheries during 1993-1997 represents 74% of the total chinook salmon harvest from the Westside Susitna Management Unit fisheries. The Dshka River consistently provided the largest chinook salmon harvest within the NCIMA until 1993. In 1994 harvests declined dramatically, resulting in closing the Dshka River to chinook salmon fishing June 17, 1994 through June 21, 1997.

The peak harvest at the mouth of Alexander Creek (Susitna River Mile 10) normally occurs during the first week in June. The harvest at the mouth of the Dshka River (Susitna River Mile 40) peaks during mid-June, whereas at Lake Creek (64 miles from the mouth of the Susitna River at Yentna River Mile 34) the peak harvest usually takes place during the third week in June.

Harvest levels at major westside Susitna River fisheries increased substantially from 1979-1993. Improved access (as described in Whitmore et al. 1993) and population growth undoubtedly increased both participation and harvest. However, it is important to recognize that liberalized regulations during 1986 through 1992, when the chinook salmon bag limit in this area was

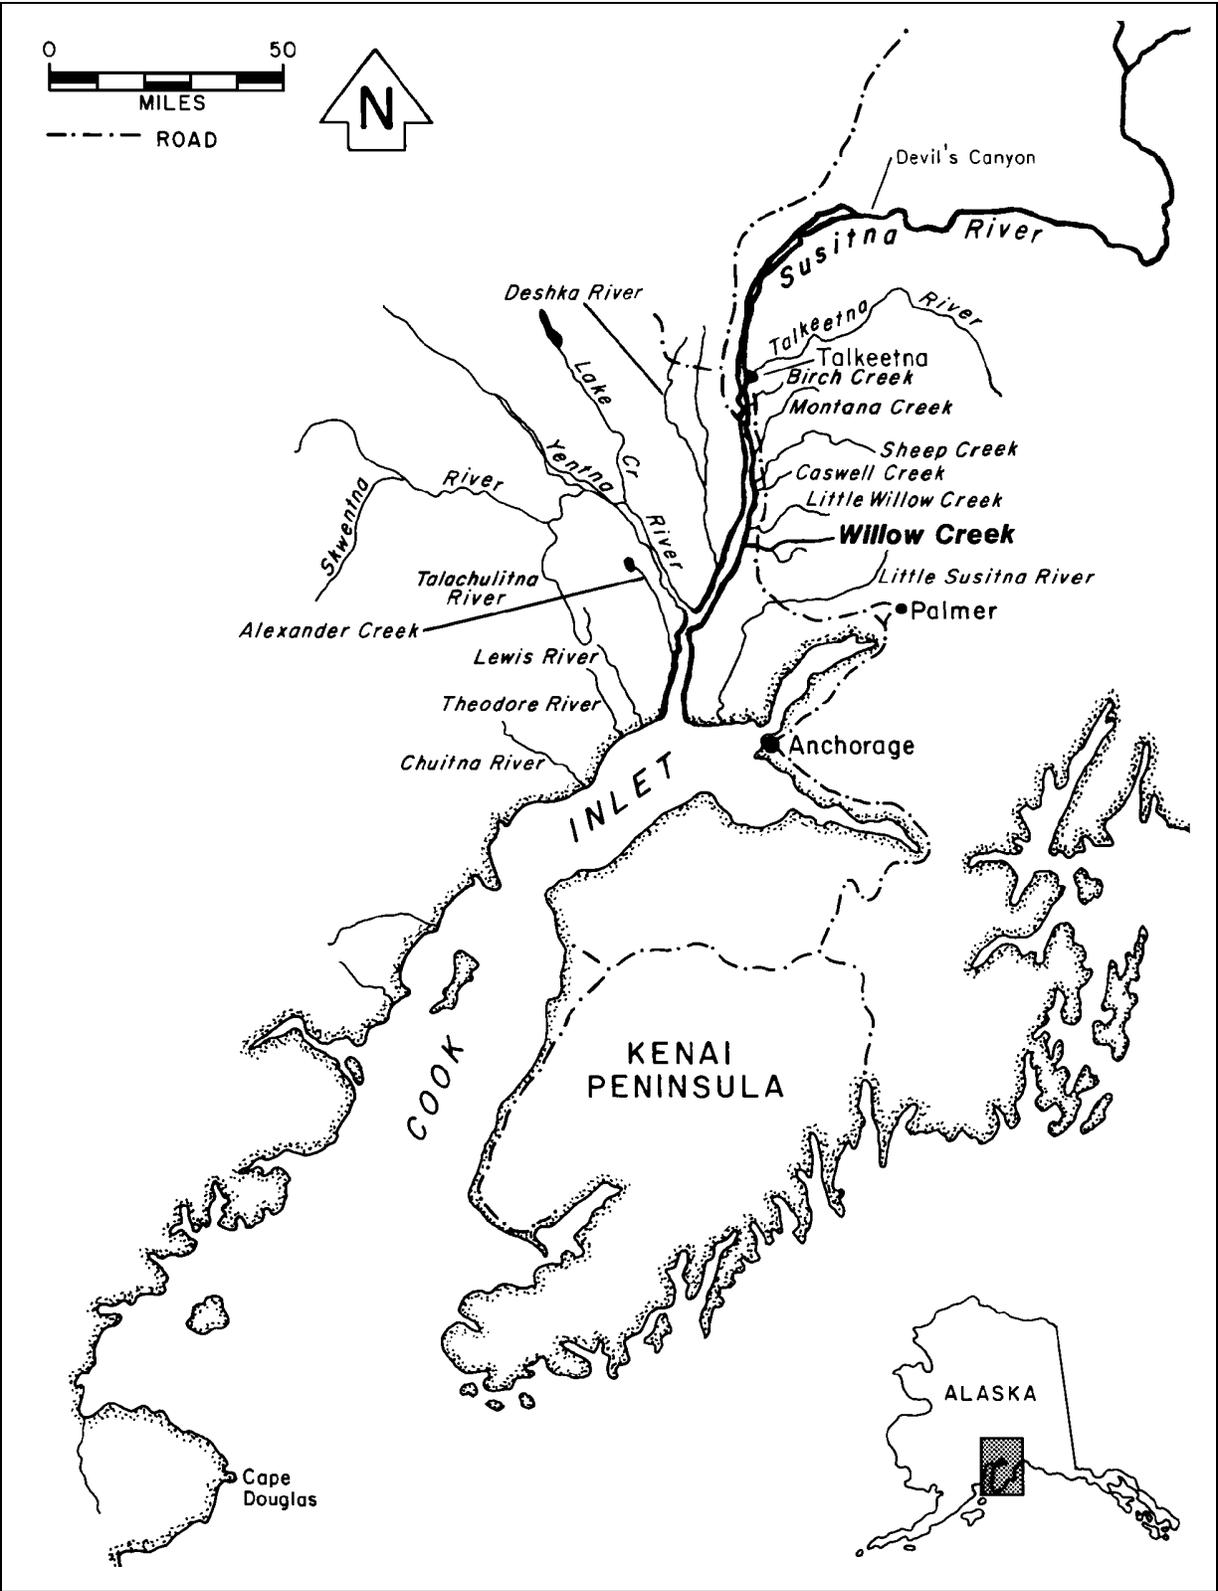

Figure 17.-Map of Northern Cook Inlet area.

increased to two daily over 16 inches in length (only one over 28 inches) and four in possession (only two over 28 inches), also contributed to an increased harvest. Regulations governing westside Susitna River fisheries since chinook salmon fishing reopened in 1979 are described in Appendix E.

The chinook salmon fishing season at all westside Susitna River fisheries through 1993 extended from January 1 through July 13. With the exception of the Deshka and Chulitna rivers, all westside Susitna River tributaries were open to chinook salmon fishing in their entirety. The Deshka River drainage was closed to chinook salmon fishing upstream from the Moose/Kroto Creek fork; and the Chulitna River was closed with the exception of the East Fork drainage, which is within the Eastside Susitna Management Unit. Beginning in 1994 additional time and area closures have been implemented to reduce chinook salmon harvest and effort. Unbaited, single-hook artificial lures are mandatory within the Talachulitna River and in large portions of Lake and Alexander creeks and the Deshka River.

The Deshka River, Alexander Creek, Lake Creek and the Talachulitna River are included in the Recreation Rivers Act.

Commercial services play an important support role in Westside Susitna Management Unit fisheries. Creel surveys in 1989 revealed that 64% of the chinook salmon fishing effort at Lake Creek was supported by some form of commercial service; e.g. fishing guides, lodges, air charter, etc. (Engel and Vincent-Lang 1992). In contrast, commercial services were used by only 14% and 6% of the participants at Alexander Creek and the Deshka River, respectively. It is thought that commercial services have increased their role in the Alexander and Deshka river fisheries since the 1989 survey.

Aerial surveys during the 1990 chinook fishery revealed very light fishing pressure scattered throughout the vast reaches of the Yentna River drainage (Sweet et al. 1991). The distribution and magnitude of this effort did not suggest that any surveyed water was in danger of over-harvest because of heavy fishing pressure.

Beginning in 1991 and continuing through 1996, chinook salmon spawning abundance in westside Susitna River tributaries fell below desired levels (Table 29). Chinook salmon escapement counts in the Deshka River indicated an alarming decline during this period, while the average recreational harvest of chinook salmon during 1990 through 1992 was approximately 40% greater than the average harvest during the previous 10 years (Appendix A7). The escapement goal for the Deshka River from 1994 through 1998 was 1,200 chinook salmon, counted by aerial survey. This goal was not achieved from 1991-1996 (Table 29).

Concern for Susitna River chinook salmon grew during 1992 when harvest rates of commercial and sport fisheries that intercept these stocks reflected that fish abundance was less than desired. An emergency order (E.O.) effective June 22, 1992, reduced the daily bag and possession limit for chinook salmon 16 inches or more in length to one fish in all waters of the Susitna and Little Susitna River drainages. It also required the release of all chinook salmon 16 inches or more in length, and the use of unbaited, artificial lures in all waters of the Deshka River drainage between the Deshka River's confluence with Trapper Creek and the confluence of Moose and Kroto creeks (the Forks); and in all waters of the Alexander Creek drainage upstream from Alexander Creek's confluence with Trail Creek (Appendix D). Growing concern caused the BOF during

<sup>a</sup> No count conducted.

<sup>b</sup> May include Donkey Creek, Red Creek and other miscellaneous creeks.

<sup>c</sup> Low count due to timing, poor visibility or weather conditions.

<sup>d</sup> Biological escapement goal.

<sup>e</sup> Aerial escapement goal 1994-1998 was 11,200; revised for 1999 to 8,750.

<sup>f</sup> During 1998 weir count represents only half the return. High water delayed construction until June 16.

its 1992 meeting to adopt new regulations for the 1993 chinook salmon season. These regulations included a bag limit of one daily and two in possession, a seasonal five Cook Inlet chinook salmon limit and a requirement that sport fishing guides cannot participate or engage in fishing during the chinook salmon season while clients are present or within their control.

In response to a low escapement to the Deshka River in 1993, an emergency order was issued prior to the 1994 season which: (1) prohibited the use of bait throughout the Deshka River drainage, and (2) reduced the possession limit for chinook salmon greater than 16 inches in length to one fish in the Deshka River drainage. In combination with current areawide regulations, managers believed these actions would reduce the recreational harvest by half in the Deshka River. A low harvest by the Northern District commercial fleet during the early portion of their 1994 season, in combination with poor catch rates in the Alexander and Lake creeks recreational fisheries, indicated that a low return of chinook salmon to the Susitna River drainage was occurring. In response, an emergency order was issued effective June 17, 1994, which closed the Deshka River to fishing for chinook salmon and prohibited the use of bait in the majority of the Susitna River drainage. In addition, the remaining periods of the Northern District commercial setnet fishery were closed.

Aerial survey evaluation of streams in the Westside Susitna Management Unit during 1994 resulted in a fourth consecutive year of reduced chinook salmon abundance (Table 29). BEGs were not achieved within any of the index streams during the 1994 season. This prompted the regulations adopted during the 1994 BOF meeting which were intended to decrease the 1995 chinook salmon harvest to half the 1994 level. Regulations adopted during the 1996 meeting were established to further conserve the chinook salmon resource in efforts to meet established BEGs (Appendix F).

### **Recent Fishery Performance**

The 1998 chinook salmon fishery resulted in a harvest of 10,958 chinook salmon, slightly above the 1993-1997 mean (Appendix A7). The 1998 escapement surveys resulted in all streams exceeding their BEGs (Table 29).

During 1998, in response to a petition addressed by the BOF, the lower 5 miles of the Deshka River were opened with a two fish seasonal limit. The resulting SWHS harvest and catch estimates were 4,143 and 7,219, respectively. This harvest estimate combined with the escapement survey results indicate that the Deshka River return is no longer an immediate concern.

Early in the 1999 season catch information from the sport harvest at Alexander Creek along with harvest information from the commercial fishery indicated the beginning of an above average return. In response to the excess escapement during the prior 2 years, the BOF expanded the area opened for chinook salmon fishing in the Deshka River to the lower 17 miles and raised the seasonal limit to five fish over 16 inches for the 1999 season. By June 9 Deshka River weir count again indicated an above average return was in progress. This prompted the department to issue an E.O. to liberalize sport fishing regulations on the Deshka River. The use of bait was allowed whereby increasing the harvest of surplus fish. The Deshka River aerial survey in 1999 resulted in 12,904 fish, well above the BEG for the third consecutive year (Table 29). The Deshka River weir count was 29,307, well above the 17,500 fish BEG set for weir passage.

Age, sex and length samples were collected from the chinook salmon passing through the Deshka River weir (Table 28). Male chinook salmon accounted for 55% of the sample, with age-1.2, -1.3 and -1.4 fish representing 30%, 44% and 26% of the sample, respectively.

Inseason reports from lodge owners, guides and anglers further up the Susitna drainage at Lake Creek, Talachulitna River and Clear Creek also indicated that the chinook salmon return was above average. The 1999 escapement surveys resulted in all streams exceeding their BEGs.

### **Management Objectives**

Biological escapement goals for five Westside Susitna Management Unit systems (Lake, Alexander, Peters creeks and the Deshka and Talachulitna rivers) have been established (Table 19). These escapement goals were based on historic aerial counts of escapement index areas. In addition, during 1999 the BOF established a weir-based escapement goal for the Deshka River. The BOF also lowered the Deshka River aerial survey goal from 11,200 to 8,700 based on data indicating approximately 50% of the weir count was observed during an aerial survey. The management objective for these five systems is to achieve the escapement goals while providing maximum levels of chinook salmon fishing opportunity.

In the Talachulitna River, only single-hook artificial lures may be used to allow for the sustained yields of trophy-sized rainbow trout. Full utilization of chinook salmon within this drainage is not a primary objective.

### **Recent Board of Fisheries Actions**

During the October 1997 meeting the BOF responded in support of a petition to open the Deshka River to chinook salmon fishing for the 1998 season. The BOF stipulated a seasonal limit of two Deshka River chinook salmon and delegated authority to the commissioner of the Department of Fish and Game to establish a fishery under the Administrative Procedure Act.

Regulations affecting the Westside Susitna Management Unit adopted by the BOF during the February 1999 meeting were:

1. The Deshka River will be open to chinook salmon fishing from its mouth upstream to Chijuk Creek a distance of approximately 19 River miles from January 1 to July 13. Other area regulations apply such as a one fish per day bag and possession limit, a five fish seasonal limit, and once an angler harvests his or her chinook they must quit fishing for chinook salmon the remainder of the day. Additionally fishing is allowed only between the hours of 6:00 a.m. to 11:00 p.m., no bait is allowed and guides cannot fish while guiding clients.
2. The area open for retention of chinook salmon on Alexander Creek was extended from its mouth upstream to Trail Creek. This provides anglers with an additional 11 miles of stream from the 1997 and 1998 seasons in which they may harvest chinook salmon on Alexander Creek.
3. In all waters of the Westside-Susitna River and West Cook Inlet Management Areas (excluding waters between the Deshka River and the Talkeetna River mouths), anglers will be allowed to continue to fish for chinook salmon (catch-and-release) once they have harvested their limit excluding Alexander Creek, Lake Creek, Deshka River, Fish Lake Creek and Clear Creek. In these streams you will be required to quit fishing for chinook salmon for the day once you have harvested your limit.

In addition, during 1999 the BOF established a weir-based escapement goal of 15,500 fish for the Deshka River and lowered the Deshka River aerial survey goal from 11,200 to 8,700.

The next BOF meeting concerning westside Susitna River chinook salmon fisheries will take place in 2002.

### **Current Issues**

Managers are concerned with providing fishing opportunity for anglers while maintaining the harvest at a level that will allow escapement goals to be met.

As previously noted, the Deshka River, Alexander Creek, Lake Creek and the Talachulitna River have been classified by the Alaska Legislature as recreation rivers. Motorized/nonmotorized restrictions and commercial-use permits are the most controversial issues associated with this plan. No funds have been allocated for enforcement of recreational rivers regulations.

Improved or expanded access to the western drainages of the Susitna River is yet another issue confronting the fisheries and fishery users of this area. Numerous recreational support industries that service the area as well as residents of the area favor retention of the region's wilderness (roadless) features. Many other interests support an expanded road system within the area which would promote development of mineral, forest, agriculture and recreation resources as well as enhance private settlement of the area. The issue of transportation corridors is addressed in Whitmore et al. 1993.

Timber sales along upper Deshka River tributaries may have an impact on juvenile chinook salmon rearing habitat in affected portions of the creek. Increased access due to the accompanying logging activity may also lead to additional poaching.

### **Ongoing Research and Management Activities**

Escapement index counts by aerial survey have been performed annually on major westside Susitna River chinook salmon populations since the mid 1970s. Harvest trends for most Westside Susitna Management Unit stocks have also been assessed by the SWHS since chinook salmon fishing reopened in 1979. Inseason surveys have also documented age, length, and sex compositions of major chinook salmon stocks.

A juvenile chinook salmon coded wire tagging (CWT) program was operated at the Deshka River in 1995-1997. Tag recoveries will occur as these fish are intercepted in commercial, subsistence and recreational fisheries in which catch sampling programs are being conducted by the department. In addition, a weir is placed in the Deshka River where biological information is collected (Table 28), returning adult chinook salmon are counted and harvest upstream of the weir is recorded. In the long term the CWT program and weir will provide data to determine the sustainable yield of chinook salmon in the Deshka River. The weir will also increase our understanding of the relationship between aerial surveys and total run size. The Deshka River weir will be operational during the 2000 season.

As regulations become more numerous and restrictive, department personnel have become more involved in regulation enforcement; specifically, inspecting fishing licenses and harvest records.

### **Recommended Research and Management Activities**

The Deshka River weir project should be continued to provide biological data and inseason return information.

Chinook salmon escapement monitoring should be continued. Harvest trends should be evaluated annually through the SWHS. We recommend that catch, escapement and carcass sampling be conducted at the Deshka River, and catch sampling be conducted at Alexander and Lake creeks. Age, sex and size information collected from these fisheries is necessary for development of brood tables, with the goal of refining BEGs and developing forecast techniques for these stocks.

Enforcement activities by department staff should continue to supplement Fish and Wildlife Protection.

## **West Cook Inlet Management Unit Chinook Salmon Fisheries**

### **Fishery Description and Historical Perspective**

The West Cook Inlet Management Unit extends south from the mouth of the Susitna River to the West Foreland of Cook Inlet (Figure 18). Streams of this area, with the exception of the Chakachatna-McArthur and the Beluga River drainages, are relatively small clearwater coastal drainages that originate in the Alaska Range or from slopes of Mount Susitna. The Chakachatna-McArthur and Beluga River drainages are largely glacial and receive minor use by chinook salmon fishermen.

Access to the coastal fisheries within the West Cook Inlet Management Unit is by air or water because there is no road link to the Southcentral Alaskan highway system. A road network, built to facilitate oil and gas exploration and the timber industry, does exist in the Tyonek/Beluga area. Several gravel aircraft landing strips are present and a few roads also serve as runways. The village of Tyonek, with a population of nearly 300 people, is the area's primary population center.

Chinook salmon begin to arrive in the area during late May with the peak of most fisheries occurring during mid to late June. The stock is also harvested in a targeted Northern District set gillnet fishery and the Tyonek subsistence fishery. Commercial fishing is permitted to within 500 yards of the mouths of several streams.

From 1985 through 1990 participation in these recreational fisheries reached record highs (Table 5). During 1991 and 1992 participation decreased in response to reduced bag and possession limits and reduced season length. Participation levels since 1992 have fluctuated between 5,800 and 9,400 angler-days, annually.

The Theodore, Chuitna and Lewis rivers are the area's most prominent chinook salmon fisheries. The collective annual harvest of chinook salmon from all streams from 1993 through 1997 ranged from 674 to 1,855 fish and averaged 1,207 fish (Appendix A9). Access to this area is by helicopter in the upper reaches of these streams and by airplane combined with vehicle to the lower reaches.

In the 1990s, observed spawning escapements in West Cook Inlet Management Unit streams did not always reach some streams' BEG (Table 30). The reduced abundance of spawning chinook salmon in the West Cook Inlet Management Unit can not be attributed solely to elevated instream participation and harvest. Weak returns were also caused by flood-related mortality of eggs and juveniles which occurred in 1986. Inspection of the coastal streams after the October 1986 flood revealed substantial streambed scouring and rechannelization. In association with the flooding there was severe erosion, landslides and subsequent deposition of earth and debris into

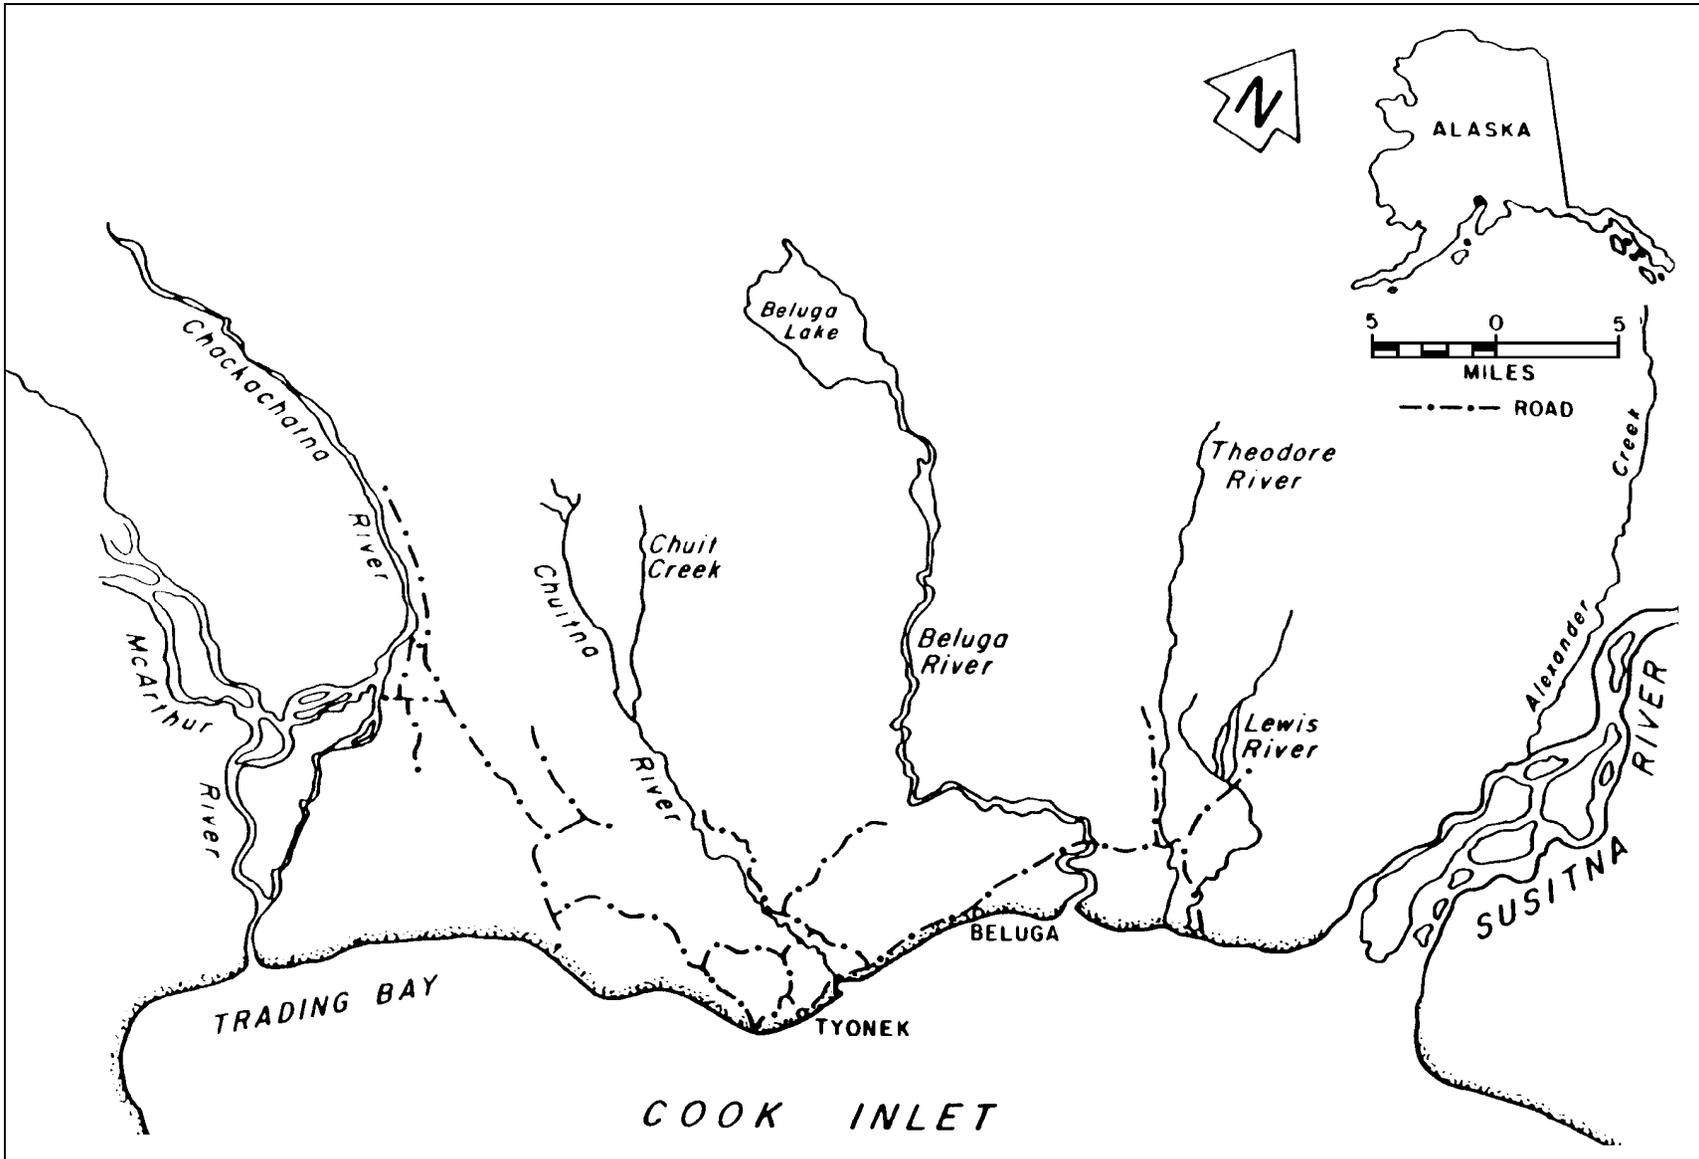

Figure 18.-Map of West Cook Inlet coastal streams.

<sup>d</sup> Biological escapement goal.

the streams. The 1993 escapement index count showed an improvement over the previous 4 years but dropped again in 1994. The 1994-1996 escapement counts for all streams were below their escapement goals. This trend reversed in 1997 when all West Cook Inlet BEGs were exceeded.

### **Recent Fishery Performance**

Concern for West Cook Inlet Management Unit chinook salmon stocks escalated during the early 1990s. Low catch rates in the commercial, subsistence, and recreational fisheries, coupled with low observed spawning escapements, have warranted restriction by regulation and emergency order for recreational fisheries (Appendix D).

The Theodore and Lewis rivers were closed to chinook salmon fishing for the 1997 season. The combined sport harvest for the West Cook Inlet drainage during 1997 was estimated to be 915 fish (Appendix A9). Both rivers remained closed in 1998 which, combined with unfavorable water conditions in the Chuitna River during chinook season, resulted in a 1998 harvest estimate of 706. The Chuitna, Lewis and Theodore rivers all surpassed their spawning escapement goals (BEG) for 1998 (Table 30).

The Chuitna River is the main indicator stream for gauging the strength of chinook salmon returns to the West Cook Inlet drainage. However, during 1999 poor fishing conditions due to high water precluded gathering early-season harvest information on this system. Guides and anglers frustrated with poor water conditions on the Chuitna River decided to shift their effort to the Theodore River (open to catch-and-release fishing in 1999) as water conditions on this system were low and clear. Catch information from anglers fishing the Theodore River indicated a stronger than average return. About mid-June, when the water conditions in the Chuitna improved, catch rates began to increase. In addition, aerial observations from some of the helicopter charter services reported lots of chinook salmon in the Chuitna and Lewis rivers.

Aerial surveys to index chinook salmon spawning escapement indicated all streams surpassed their BEGs in 1999 (Table 30). If this trend continues the department may submit a proposal at the next BOF meeting to liberalize chinook salmon fishing regulations.

### **Management Objectives**

Biological escapement goals for three West Cook Inlet Management Unit streams have been established (Table 19). These escapement goals were based on historic escapement index counts. The management objective for these three streams is to achieve the escapement goal while providing maximum levels of sustained chinook salmon fishing opportunity.

### **Recent Board of Fisheries Actions**

During the February 1999 BOF meeting the following regulation were adopted:

1. In all waters of the Westside-Susitna River and West Cook Inlet Management Areas (excluding waters between the Deshka River and the Talkeetna River mouths), anglers will be allowed to continue to fish for chinook salmon (catch-and-release) once they have harvested their limit excluding Alexander Creek, Lake Creek, Deshka River, Fish Lake Creek and Clear Creek. In these streams you will be required to quit fishing for chinook salmon for the day once you have harvested your limit.
2. The Theodore River was opened to catch-and-release fishing for chinook salmon from January 1 through June 30, only single hook artificial lures will be allowed. Other West

Cook Inlet Area regulations apply as follows: fishing is allowed only between the hours of 6:00 a.m. to 11:00 p.m., bait is prohibited, and guides cannot fish while guiding.

3. If at least 90% of the biological escapement goal (BEG) for the Chuitna River is not met during the fishing season the Chuitna River shall be closed to sport fishing for chinook salmon during the following fishing season. Provisions of this paragraph do not apply after December 31, 2001.

The following regulations apply to the Northern District commercial chinook salmon fishery:

1. June 1 through June 24 the area from 1 mile south of the Theodore River to the Susitna River is open the first Monday in June only. Provisions of this paragraph do not apply after December 31, 2001.
2. If at least 90% of the biological escapement goal (BEG) for the Theodore River (BEG = 750) or Chuitna River (BEG = 1,400) is not met during the fishing season, the area from 1 mile south of the Chuitna River to the Susitna River will be closed to commercial fishing during the following fishing season; the provisions of this paragraph do not apply after December 31, 2001.

The next BOF meeting concerning the West Cook Inlet Management Unit chinook salmon fisheries will be in 2002.

### **Current Issues**

The decline in spawning chinook salmon abundance beginning in 1990 became a major concern facing these fisheries. This reduction may be partially related to flood events during the 1980s. The West Cook Inlet Management Unit streams experienced the same declining trend seen in streams of the Susitna River drainage.

With the 1997-1999 escapement surpassing BEGs in all streams it is hoped the stocks have reached a level that will allow relaxation of some of the closures imposed in recent years.

The Beluga River drainage has supported an increased number of anglers during the 1996-1999 seasons. Several air taxi operators and area lodges drop anglers and guides at the confluence of Coal Creek and Beluga Lake. A survey of this area needs to be conducted to determine impacts of increased use. Additionally, a BEG should be considered for Coal Creek chinook salmon.

Angler trespass on Tyonek Native Corporation (TNC) lands along the Chuitna River has been an issue for many years. Representatives of the State of Alaska have had several meetings with TNC members in efforts to resolve this problem. Although the State believes that under state law the public may stand or walk on any part of the river bed below the ordinary high water mark, TNC has informed the state that it views such activity on the south half of the river bed as trespass. There are two ways for the public to access the Chuitna River without trespassing on private lands. There is public access from the north across Kenai Peninsula Borough property and from the Pan Am Road at Mile 7.

Timber sales adjacent to WCI streams may have an adverse impact on juvenile salmon rearing habitat. Additionally, increased access due to logging activity may lead to additional poaching.

Proposals to prohibit the use of helicopters in WCI fisheries, specifically the Chuitna River drainage, have been addressed by the BOF during the last several meetings. The BOF has not supported prohibiting helicopters.

### **Ongoing Research and Management Activities**

Research and management activities directed at these fisheries have consisted of periodic onsite creel observation and regulation enforcement activities, annual assessment of chinook salmon escapement by helicopter, and estimation of annual harvest by the SWHS.

### **Recommended Research and Management Activities**

Chinook salmon fishery monitoring should be continued. Harvest trends should be evaluated annually through the SWHS.

Continued success of WCI streams in meeting established BEGs may lead to relaxing more restrictions on chinook salmon fishing.

Enforcement activities should be continued to ensure compliance with existing regulations.

## **COHO SALMON FISHERIES**

Recreational harvests of coho salmon in the NCIMA ranged from 15,489 to 80,240 fish during 1977 through 1997, and averaged 47,104 fish (Mills 1979-1994; Howe et al. 1995-1998) (Table 7 and Appendix A11). During 1993 through 1997 NCIMA harvests accounted for 21% of the coho salmon harvests in the region and 14% of the statewide harvests (Table 31). Within the NCIMA, the Knik Management Unit, which includes the Little Susitna River, accounts for the largest harvest of coho salmon. The Eastside Susitna Unit is a close second followed by the Westside Susitna Unit. West Cook Inlet Management Unit, with fewer accessible streams, is a distant fourth in average harvest. Harvests of coho salmon in the Knik Management Unit are dominated by harvests from the Little Susitna River while harvests from other management units are distributed across several systems (Appendices A12-A19).

In addition to recreational harvests, NCIMA area coho salmon stocks contribute to Cook Inlet commercial harvests. Commercial harvests of coho salmon in Upper Cook Inlet commercial fishing districts averaged 448,103 fish during 1977-1996, followed by an average of 146,130 during 1997-1999 (Appendix B2). The Central District drift gillnet fishery accounted for approximately one-half of the average harvest (Appendix B3). Significant numbers of NCIMA-bound coho salmon are harvested in the Western subdistrict of the Central District and in the General and Eastern subdistricts of the Northern District (Appendices B4-B7 and B9). The remaining commercial harvests of coho salmon are from several smaller subdistricts within the Central District (Ruesch and Fox 1996).

Management strategies for NCIMA coho salmon begin to develop as the stocks enter Cook Inlet and are intercepted by the commercial fishery. The magnitude, catch per unit effort, and distribution of the commercial harvest are the first indicators of general run strength. Comparison between years can be difficult as fishery restrictions may vary from year to year. As coho salmon enter fresh water, the department has had very limited ability to gauge overall run size. Until 1997, counting weirs at the Little Susitna River and the Deshka River provided the only quantitative measure of coho abundance in the many drainages of Northern Cook Inlet.

Beginning in 1997 weirs were also operated in Wasilla, Cottonwood and Fish creeks. Fish wheels and sonar on the Yentna River, and foot and aerial index counts for a few streams also contribute to our understanding of relative abundance.

**Table 31.-Northern Cook Inlet Management Area recreational harvest of coho salmon by management unit as estimated by SWHS, 1977-1998.**

In response to a poor return of coho salmon to Cook Inlet in 1997, emergency orders were issued to close the commercial fishery and to institute an areawide bag limit reduction and bait prohibition for wild stock recreational fisheries. Restrictive action was again taken in the commercial fishery in 1998 because of a poor sockeye return. Because of the nature of the mixed-stock fishery, this action undoubtedly put more coho salmon on the spawning grounds. No additional action was required in the sport fishery during 1998 as instream coho abundance seemed to be above average. In 1999, poor returns again forced managers to take action in the sport and commercial fisheries. Unfortunately these actions were instituted too late to increase coho salmon inriver abundance. Low abundance of coho salmon to UCI streams prompted the governor and users to submit a request to the BOF to meet out of cycle and address this conservation problem. The BOF met in February 2000 and significant actions to both the sport and commercial fisheries were taken to reduce the overall harvest of Cook Inlet coho salmon.

A creel survey to estimate coho salmon harvest and fishing effort was conducted at the Little Susitna River from 1982 through 1993. Intermittent or partial creel survey data have also been collected from other coho salmon fisheries.

### **Knik Arm Management Unit: Little Susitna River Coho Salmon Fishery Background and Historical Perspective**

The harvest of Little Susitna River coho salmon has ranged from 2,835 to 27,610 during 1977 to 1998 (Table 32) (Mills 1979-1994; Howe et al. 1995-1999). It has been a consistent second to the Kenai River which supports the largest freshwater coho salmon harvest in Alaska.

Coho salmon escapements to the Little Susitna River were measured by weir in 1986 and from 1988 through 1999. In 1986 the weir was damaged for several days by flood waters and the escapement count through the weir was incomplete (Table 33). Prior to 1986, coho salmon escapement abundance was indexed by ground and/or aerial methods when water conditions permitted. Weir counts from 1988 through 1995, when the weir was installed at River Mile (RM) 32.5, averaged 21,428 coho salmon. Beginning in 1996 the weir was moved upstream to RM 71 making direct comparison of counts impossible.

Access to this fishery is described in the section addressing the river's chinook salmon fishery.

Coho salmon return to the Little Susitna River primarily from mid-July through early September. Tagging studies indicate that coho salmon migrate slowly up the Little Susitna River and remain available to the fishery for about 4 weeks, after which they pass the George Parks Highway bridge into waters closed to fishing for salmon. Spawning takes place from late September through mid-October. Spawning primarily occurs upstream from the George Parks Highway in the mainstem of the river; however, some spawning occurs in tributary streams.

Supplemental coho salmon stocking occurred at the Little Susitna River from 1982-1995 (Table 34). Fingerling plants dominated the initial years of stocking but these releases generally yielded low returns. Beginning in 1987, returns from smolt releases started to make significant contributions to the sport harvest. The 1995 smolt release in Nancy Lake was the last stocking of hatchery coho salmon for the Little Susitna River.

**Table 32.-Harvest and effort for Little Susitna River coho salmon as estimated by SWHS, 1977-1998.**

Year	Harvest			Released	Annual Effort
	Hatchery <sup>b</sup>	Nonhatchery	Total <sup>c</sup>		Angler days <sup>a</sup>

<sup>a</sup> Bartlett and Conrad 1988, Bartlett and Vincent-Lang 1989, Bartlett and Sonnichsen 1990, Bartlett and Bingham 1991, Bartlett 1992-1994, 1996.

During 1986 through 1996 the contribution of hatchery fish to the sport harvest ranged from 17% to 75% and averaged 34%, varying with the number of fish released and the strength of the wild fish return (Tables 32 and 34) (Bartlett and Conrad 1988, Bartlett and Vincent-Lang 1989, Bartlett and Sonnichsen 1990, Bartlett and Bingham 1991, Bartlett 1992-1994, 1996).

Coho salmon smolt were released into Nancy Lake, which drains into the Little Susitna River about 6 miles downstream from the George Parks Highway (Figure 12). Nancy Lake did not support a return of adult coho salmon before stocking occurred, however, rearing juvenile coho salmon occupied Nancy Lake by ascending Lake Creek from the Little Susitna River.

The Little Susitna River coho salmon sport fishery has been managed in accordance with the Little Susitna River Coho Salmon Management Plan since 1991 and as modified following the 1992 and 1996 seasons. Currently the bag and possession limits are set by the management plan at three coho salmon 16 inches or more in length per day and in possession.

Only unbaited, artificial lures are allowed in the Little Susitna River between July 15 and August 6. This requirement was originally designed to reduce the catch rate of the early arriving

nonhatchery stock and remains in effect to reduce hook-and-release mortality. The hook-and-release mortality of bait-caught, ocean-fresh coho salmon has been documented to be approximately 70% (Vincent-Lang et al. 1993). The management plan allows the use of bait beginning August 6.

Prior to the 1996 season the management plan also directed liberalization of the bag and possession limit by emergency order to five coho salmon downstream of River Mile 32.5 and within a one-quarter mile radius of the confluence of Lake Creek and the Little Susitna River when the escapement goal of 7,500 nonhatchery coho salmon upstream of the Parks Highway was projected. This direction to liberalize the bag limit was eliminated during the November 1996 Board of Fisheries meeting. Downstream of the old weir site at River Mile 32.5 anglers are required to quit fishing when a bag limit of Little Susitna coho salmon is harvested. Coho salmon intended to be released cannot be removed from the water. This requirement also helps reduce hook-and-release mortality.

Creel and escapement observations have shown that coho salmon abundance at the Little Susitna River fluctuates widely. Inriver returns have ranged from approximately 20,000 to 62,000 during 1988 through 1997 (Tables 32 and 33).

### **Recent Fishery Performance**

During 1998 the SWHS estimated 17,164 coho were harvested for the Little Susitna River, approximately equal to the 1993-1997 mean of 16,468 (Appendix A12). The weir count totaled 15,159 (Table 33), within the middle of the BEG range. The 1998 season occurred without any inseason emergency orders and appears to have provided an average fishery.

In 1999, a total of 3,017 coho salmon were counted through the Little Susitna River weir at River Mile 71 (Table 33, Appendix H6), less than a third of the lower end of the 9,200-19,600 fish BEG. A few guides were reporting poor catches of coho salmon early in the season. However, with the no-bait rule in effect until August 5 and high turbid water, it was assumed that low catch rates were more a factor of poor fishing conditions than low coho salmon returns. As the season progressed and water conditions improved it became evident a lower than normal return would result. This prompted the department to take E.O. action to restrict these fisheries to a one fish bag limit and prohibit the use of bait beginning August 19.

A total of 660 coho salmon were sampled for age and sex composition and mean length estimates at the Little Susitna weir in 1999. Age 2.1 was the dominant age class and accounted for 72% of the fish (Table 35). Coho salmon passed through the weir in 1999 were 58% male. The mean length of all sampled fish was 577 mm (Table 35).

### **Management Objectives**

Management objectives for the Little Susitna River as stated in the Little Susitna River Coho Salmon Management Plan are to provide 9,600-19,200 naturally spawning coho salmon upstream of the George Parks Highway and to provide coho salmon fishing opportunity from the George Parks Highway downstream to tidewater without emergency restrictions.

### **Recent Board of Fisheries Actions**

During the February 1999 meeting the BOF adopted the following regulation change: on the Little Susitna River, anglers will be allowed to use treble hooks year-round downstream of the

Parks Highway Bridge. Existing bait restrictions were modified to allow the use of bait during the month of September.

During an “out of cycle” BOF meeting in February 2000 the Board adopted regulations to reduce the recreational daily coho salmon bag and possession from three coho to two and reduce the amount of allowable gear in the Northern District commercial fishery from three 35 fathom gill nets to two.

### **Current Issues**

In 2 of the last 3 years (1997 and 1999) the Little Susitna River coho return has been weak. Emergency orders were issued during the 1997 and 1999 seasons prohibiting bait and reducing the bag limit to one coho to insure reaching the biological escapement goal (BEG). Even with these additional restrictions the 1999 escapement reached only one-third the BEG and the 1997 return barely surpassed the lower level of the range (Table 33). Sport fishing guides have complained these conditions cause them a level of uncertainty that makes it difficult for them to plan for their clients. They would like a management plan that will spell out steps that will be taken to limit harvests when a conservation concern becomes evident during the fishing season. This plan would insure that the burden of conservation is shared by both commercial and sport fisheries.

Other issues associated with Little Susitna River fisheries are:

1. Management of the area under the Recreation Rivers Act,
2. The South Big Lake Road extension to the Little Susitna River and the associated campground (Whitmore et al. 1993),
3. The damage to riparian vegetation and accelerated stream bank erosion in areas heavily used by the public. During 1996, a survey was conducted regarding angler impacts to riparian habitat on the Little Susitna River from the mouth upstream to the Parks Highway (Bartlett *Unpublished a*). Findings from this survey indicated that 3% of the total 139 miles of river bank within the study area showed signs of impact, and
4. The management of the Little Susitna River Public Use Facility (LSPUF) including issues in regard to the increased user fees for both the public and guides, and use of the boat mooring facility and horsepower restrictions.

A description of the Recreation Rivers Act and an explanation of the South Big Lake extension to the Little Susitna are described in Whitmore et al. 1993 and Whitmore et al. 1996.

### **Ongoing and Recommended Research and Management Activities**

If funding is available the Little Susitna River weir will be moved from its present location at RM 71 downstream to RM 32. This move would provide inseason management information presently unavailable. The weir also provides run timing, age, length and sex composition and total return data.

Assessment of the sport harvest will be available through the SWHS.

Current regulation requires a prohibition of bait from July 15 through August 5 to reduce the hook-and-release mortality and preserve the early-arriving stock. Additionally, for 2000, the bag and possession limit was reduced from three to two coho salmon.

Although this fishery has been relatively stable for the past several years, future management planning must recognize that increased angling participation may occur. Inriver returns and the escapement goal of spawning stock should be maximized, in part, through the enforcement of fishery regulations designed to reduce harvest efficiency during critical periods, and through habitat actions focusing on river bank restoration and protection.

The contribution of hatchery-released Little Susitna River coho salmon to the commercial fishery has been evaluated. Currently we assume that the commercial harvest rate of wild Little Susitna coho salmon is similar. A study should be conducted to verify this assumption.

Several programs related to site maintenance, acquisition and development are discussed in the Knik Arm Management Unit chinook salmon section of this report. The location, type, and number of public recreational facilities, such as campgrounds, launches, and trails, that are ultimately constructed along the river should become a component in the long-term planning to provide diverse fishing opportunities. Funding was secured prior to the 1999 season to: (1) improve trails and stabilize river banks within the LSPUF, and (2) harden campsites, stabilize river banks, repair damage caused by boating activity and construct permanent boat tie ups along the Little Susitna River within the Susitna Flats State Game Refuge. Much of this work was completed in 1999 with the remainder scheduled for completion by 2001.

## **Knik Arm Management Unit: Other Coho Salmon Fisheries**

### **Background and Historical Perspective**

In addition to the Little Susitna River, the Knik Arm Management Unit (Figure 1) supports five significant recreational coho salmon fisheries, the area's only personal use dip net fishery, and two educational permit fisheries. Fish Creek, Cottonwood Creek, and Wasilla Creek (Figure 19) are restricted primarily to intertidal fisheries that provide weekend-only salmon fishing. Weekend-only fishing has been mandatory on these streams since 1971 because harvestable stock surpluses cannot normally accommodate continuous daily exploitation. Motor boats are not permitted on Wasilla Creek during weekends from July 15 through August 15.

The Eklutna Hydroelectric Power Plant Tailrace (Figure 14) is a recreational fishery that was originally supported by coho salmon returning to the Cook Inlet Aquaculture Association's (CIAA) hatchery located at the head of the tailrace. A fish ladder links the hatchery with the tailrace which in turn drains into the Knik River. The nonprofit Eklutna hatchery operated from 1981 through 1998. Presently the fishery is supported by hatchery fish reared at the Fort Richardson Hatchery (an ADF&G facility) and released in the tailrace. This sport fishery is confined to the one-half-mile long tailrace. Coho, chum, and a few sockeye salmon are harvested by sport anglers within the tailrace. All but the terminal 100 yards of the tailrace are subject to preferential harvest rights by the Aquaculture Association. Salmon of Knik River, and recently of Matanuska River, drainage origin are also harvested at the confluence of the tailrace and the Knik River. In light of recent coho restrictions it is likely the coho salmon stocking program will be significantly increased at this site in the future.

Jim Creek, excluding the Little Susitna River, is traditionally the largest Knik Arm recreational fishery in terms of both participation and coho salmon harvest. This stream enters the glacial Knik River about 10 river miles from salt water. The entire Jim Creek drainage is open to coho salmon fishing throughout the year. The greatest fishing effort occurs at the confluence in an

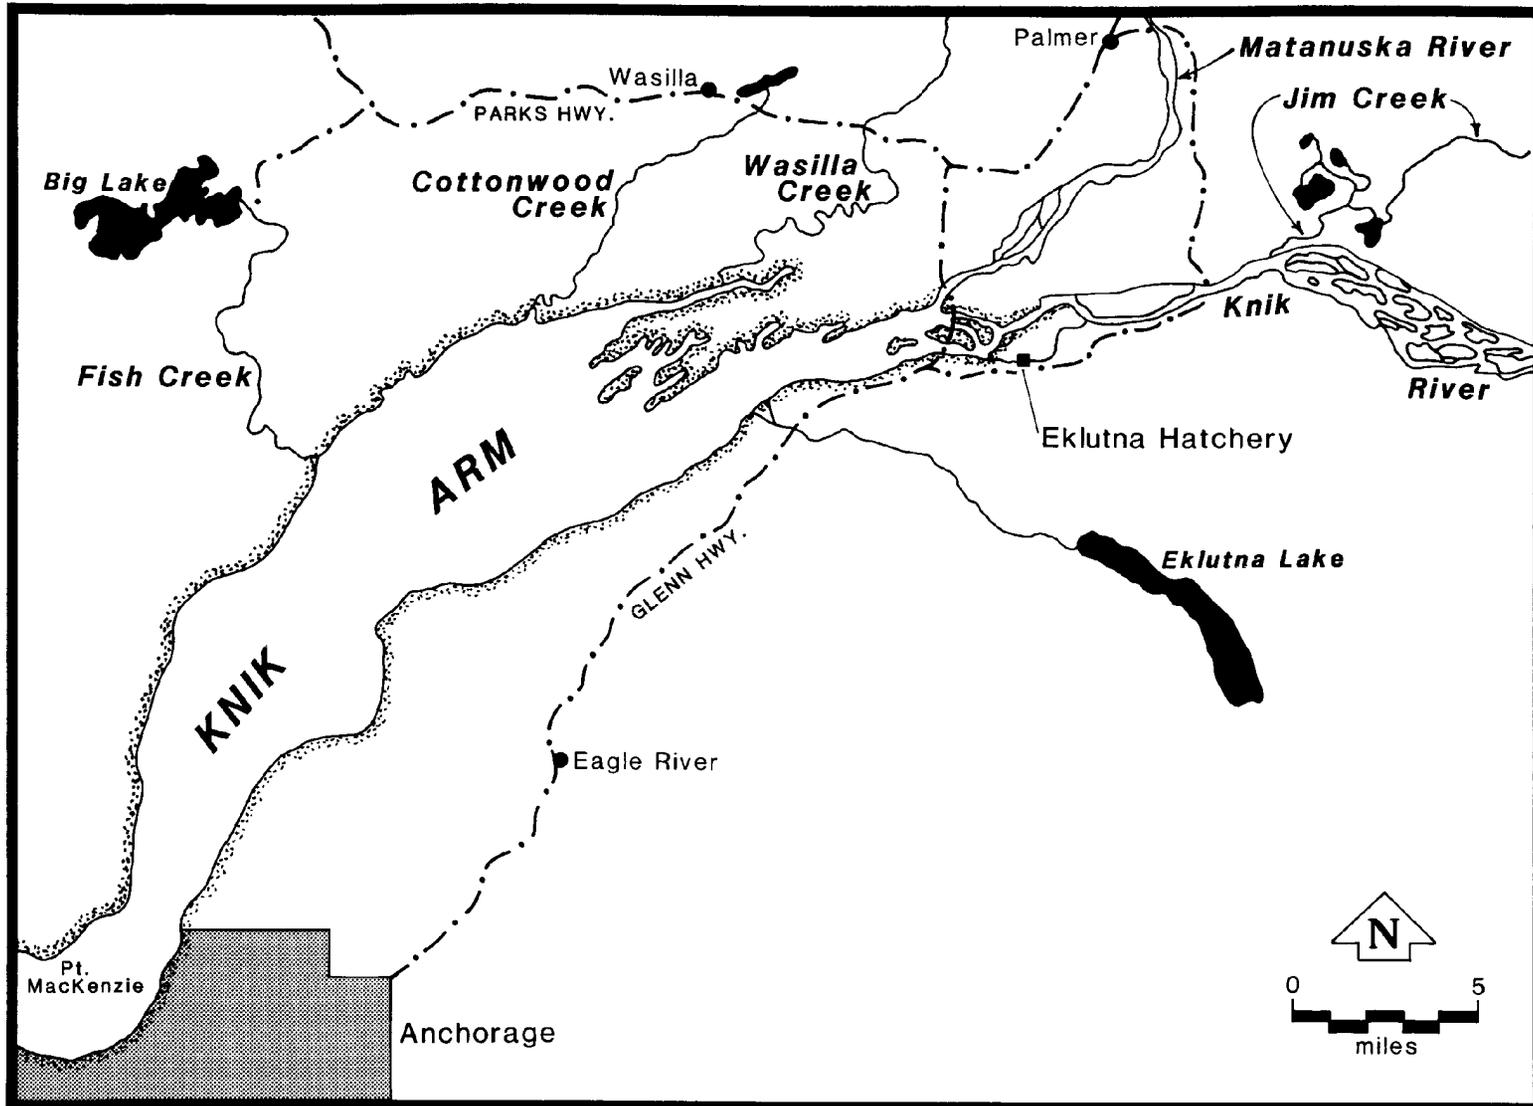

Figure 19.-Map of the Knik Arm drainage.

area locally known as the Jim Creek Flats. Fishing effort and harvest rates at the confluence are sharply influenced by the Knik River discharge. Jim Creek Flats is very difficult to fish during periods of high Knik River discharge because the entire area becomes inundated by glacial waters. Upstream reaches of Jim Creek can be accessed by power and nonpower boats.

Coho salmon return to the Knik Arm fisheries from late-July through August. Spawning occurs from late September through mid-October. The average weight of Knik Arm coho salmon, excluding those of Little Susitna River origin, is less than 6 pounds. In 2000 the bag and possession limits for all Knik Arm fisheries were reduced from three to two coho salmon 16 inches or more in length. The collective annual harvest for these five fisheries averaged 6,872 coho salmon during the period 1993 through 1997 (Mills 1994, Howe et al. 1995-1998) (Table 36). Jim Creek averaged 3,181 coho salmon during this period, whereas the three weekend-only fisheries of Fish, Cottonwood, and Wasilla creeks averaged 483, 675 and 927 fish, respectively.

Coho salmon have been periodically stocked into Knik Management Unit systems (Table 37). Stocking of Fish and Cottonwood creeks was initiated during the late 1970s, Eklutna Tailrace in 1983, and Jim and Wasilla creeks in the late 1980s. This stocking effort was made up of a combination of fingerling and smolt releases produced by the ADF&G's Big Lake Hatchery, Elmendorf Hatchery and Fort Richardson Hatchery (Table 37). CIAA also collected eggs and reared coho salmon at its Eklutna Hatchery until it suspended operation in 1998. Contribution of hatchery fish to the catch and harvest in these recreational fisheries was not evaluated.

Knik Arm coho salmon are harvested commercially in the Central and Northern Districts of Cook Inlet (Appendices B1-B7 and B9). The stocks are also harvested within Knik Arm by a set gillnet fishery that operates near the mouth of Fish Creek. The Knik Arm commercial set gillnet fishery has been conducted annually from 1987-1998 and coho salmon harvests have ranged from 85 to 11,604, averaging 2,913 annually during this period (Table 38). BOF action closed the Knik Arm commercial set gillnet fishery during 1999-2001 to allow more coho and sockeye salmon escapement into Knik Arm streams.

### **Recent Fishery Performance**

In response to coho salmon escapements lagging behind desired levels and low commercial catch rates indicating a weak return, the entire Upper Cook Inlet commercial fishery was closed on August 4, 1998. The resulting coho salmon commercial harvest for 1998 was 548 fish, approximately 20% of the 1987-1998 mean (Table 38).

The 1998 recreational harvest for Knik Arm streams was 10,539 fish, a substantial increase from 1997 and well above the 1993-1997 average of 6,301 (Table 36). The 21,620 angler-days of participation from these fisheries during 1998 fell slightly below the 1993-1997 average of 23,340. The 1998 Fish Creek personal use dip net harvest totaled 649 coho salmon. In 1998, for the second year in a row, a lack of returning sockeye salmon forced an early closure resulting in a minimal harvest of coho salmon (Table 38).

Because of weak returns in previous years, the BOF reduced recreational fishing time on Fish, Wasilla and Cottonwood creeks beginning in 1999. Fishing hours were restricted from 24-hour fishing days to 12-hour fishing days (6:00 a.m. to 6:00 p.m.) in these Saturday and Sunday only fisheries. Also in 1999, regulations were enacted to prevent anglers from continuing to fish for any species in these streams after harvesting a bag limit of coho salmon.

<sup>a</sup> Mills 1988-1994, Howe et al. 1995-1998. 1998 (final) and 1999 (preliminary) data are estimated from returned permits.

Fish, Cottonwood and Wasilla creeks, having a very limited open season, generate little angler effort; consequently, little inseason catch information is available. Jim Creek, the second most popular sport fishery, had high turbid waters through much of the 1999 season; however, the department received no complaints from anglers concerning this particular stream. Poor returns to the Knik Arm streams prompted the department to take E.O. action to restrict these fisheries to a one fish bag limit and prohibit the use of bait on August 19, 1999. Of the four Knik arm streams that have established coho salmon BEGs, not one met its escapement goal (Table 33).

Weirs were operated on Fish, Cottonwood, Wasilla, and Spring (a tributary to Wasilla Creek) creeks in 1999. Resulting counts were 1,754, 462, 1,564 and 11, respectively, all substantially below previous years (Appendices H2-H5). Length and age data were collected at all weirs (Table 35).

### Management Objectives

Biological escapement goals have been established for Fish, Wasilla, Cottonwood, and Jim creeks (Table 39). Escapement goals for Wasilla, Cottonwood and Jim creeks are based on historic escapement index counts while the Fish Creek goal is based on average coho salmon weir counts from 1968-1992. The management objective for these four systems is to achieve the escapement goal while providing a maximum level of sustained coho salmon fishing opportunity.

### Recent Board of Fisheries Actions

The BOF discussed the Knik Arm coho salmon fisheries extensively during the November 1996 meeting. No regulations were changed regarding these fisheries. However, concern was expressed regarding the low returns to those systems with established escapement goals. During

February 1999, the BOF reduced recreational fishing time on Fish, Wasilla and Cottonwood creeks. Fishing hours were restricted from 24-hour fishing days to 12-hour fishing days (6:00 a.m. to 6:00 p.m.) in these Saturday and Sunday only fisheries. Also in 1999, regulations were enacted to prevent anglers from continuing to fish for any species in these streams after harvesting a bag limit of coho salmon.

**Table 39.-Coho salmon biological escapement goals (BEG) for Knik Arm Management Unit streams.**

Stream	Biological Escapement Goal (BEG)	
Cottonwood Creek		300
Wasilla Creek		300
Fish Creek		2,700
Jim Creek Drainage		830
Little Susitna River	from 1991 thru 1998	7,500
	from 1999	9,600-19,200

An “out of cycle” BOF meeting occurred in February 2000 to address Cook Inlet coho conservation concerns. Several restrictions were imposed on the commercial and sport fisheries to reduce coho salmon harvests beginning in 2000. The following sport fishing regulations were adopted: (1) the bag and possession limits for coho salmon were reduced from three to two (excluding the stocked Eklutna Tailrace fishery); (2) Wasilla Creek was closed year-round to salmon fishing; (3) once an angler has retained a bag limit of coho salmon from Fish and Cottonwood creeks, they may not fish in either creek in waters open to salmon fishing on the same day; (4) Jim Lake, Upper Jim Creek and McRoberts Creek were closed to salmon fishing year-round.

**Current Issues**

Of major concern is the failure of Cottonwood, Wasilla, Fish and Jim creeks to consistently meet their biological escapement goals (Tables 33 and 39). The overall well-being of these stocks has perplexed managers. Review of these escapement goals has brought into question the relationship of index counts to total return in Wasilla Creek, and to a lesser extent Cottonwood and Jim creeks.

Urbanization is also a concern with Knik Arm stocks. Spawning streams which support fisheries in the Knik Arm Management Unit, excluding the Little Susitna River, are small in size and have easy public access. Several of the streams flow through residential areas and habitat degradation

to these streams and spawning areas is evident. Additionally, available information and enforcement action suggests that a substantial amount of salmon poaching occurs in these drainages. The need to address these fishing infractions and habitat violations is ongoing.

### **Ongoing Research and Management**

Annual harvest and effort information pertaining to these fisheries is obtained from the SWHS. Prior to 1997 spawning escapement was assessed by means of a weir on Fish Creek through at least August 15, primarily for management of commercial and personal use sockeye salmon fisheries. Beginning in 1998 the Fish Creek weir was operated through the end of September to more thoroughly evaluate the coho salmon return. Ground surveys have been conducted annually within established index areas in Wasilla, Cottonwood and Jim creeks. In addition, during 1997-1999, weirs were operated on Cottonwood Creek and Wasilla Creek to evaluate the total return of coho salmon.

A project to coded wire tag wild coho salmon smolts in Cottonwood Creek was initiated in 1999. These tagged coho will identify the Cottonwood Creek coho stock in the mixed-stock fisheries of Cook Inlet during their return in 2000. Currently the Cottonwood Creek coho salmon stock is one of two tagged wild coho stocks in Cook Inlet, along with tagged hatchery releases. Returning coho salmon will be inspected for finclips in the commercial and sport fisheries of Cook Inlet and the escapement in Cottonwood Creek. This multi-year project should provide information for determining appropriate escapement levels in order to provide sustainable coho salmon yields in the future.

During the period of May 17 through June 15, 1999, a total of 33,986 coho smolts were tagged and released in Cottonwood Creek. Additionally, standard measurements of age, length and weight were recorded. The mean length of all coho smolts was 121 mm fork length. During the week of May 17-May 23 the coho smolt mean length of 126.7 mm was significantly ( $\alpha = 0.05$ ) longer than the remaining three weekly coho smolt mean lengths of 119.5, 118.3 and 120 mm. Age-2 smolts dominated the age composition, ranging from 56% to 80% during the four weekly samplings. Age-1 and -3 components averaged 18% and 14%, respectively. Weights of coho smolts ranged from 42 to 613 grams. Median weights of age-1, -2 and -3 coho smolts were 94, 170 and 213 grams, respectively. Further information concerning this project will be published in a Fisheries Data Series report in FY 2001.

A multi-agency watershed study to catalogue the aquatic resources in the Cottonwood Creek drainage was initiated in 1997. The Habitat Division of ADF&G documented fish habitat, riparian vegetation and man-made alterations within the 75-foot creek setback. USGS began monitoring water stage and flow, ADF&G limnologists conducted water analysis, and the University of Alaska Anchorage is inventorying aquatic insects. In addition, ADF&G is documenting spawning distributions of rainbow trout, sockeye and coho salmon.

Coho returning to the Eklutna Tailrace were used as brood stock in 1999 (Table 27). Fish were collected by seine and transported to the Fort Richardson hatchery for egg take and development. They will be released as smolt into the Eklutna Tailrace.

### **Recommended Research and Management Activities**

The indexing of coho salmon in Knik Arm streams should continue. Weirs should be maintained on Wasilla, Cottonwood and Fish creeks to evaluate total returns of coho salmon to determine the relationship of index counts to total return.

The Cottonwood Creek CWT project and drainage aquatic resource study should be continued at least through 2001.

The Eklutna Tailrace should be stocked at increased levels to provide anglers additional coho salmon fishing opportunity. Stocking should be limited to sites such as the Eklutna Tailrace; e.g. sites without wild coho salmon stocks present. Eggs will be collected from the coho returning to the tailrace and reared at Fort Richardson Hatchery.

Several fishery access projects should be implemented in the Knik Management Unit. These are discussed in detail in the Fisheries Access Improvements section of this report. The Eklutna tailrace fishery site should be enhanced in consideration of increasing the number of coho salmon stocked at this site. Vehicle parking should be expanded, a vault toilet should be constructed, and stream bank stabilization should be designed. Land (Cope Property) should be acquired adjacent to Rabbit Slough on Wasilla Creek to assure maintenance of Wasilla Creek coho salmon rearing habitat. Additionally, a Knik River boat launch should be constructed to provide boating access to Knik River tributary streams. Purchase of the Cope Property and development of the Knik River boat launch should be conducted in conjunction with the Wildlife Conservation Division of the Department of Fish and Game. In addition to providing fishery access and coho salmon rearing habitat, development of these two sites will greatly enhance hunting and wildlife viewing opportunities.

## **Eastside Susitna, Westside Susitna, and West Cook Inlet Management Units Coho Salmon Fisheries**

### **Fishery Description and Historical Perspective**

Coho salmon harvests in the Eastside and Westside Susitna and West Cook Inlet management units averaged 20,503, 14,517 and 2,575 fish, respectively, during 1993 through 1997 (Mills 1994; Howe et al. 1995-1998) (Table 31). The Susitna River drainage supports the largest coho salmon stock within the NCIMA and the entire Upper Cook Inlet area. The contribution of the harvest from the Eastside Susitna and Westside Susitna Management Units was 57% of the total NCIMA coho salmon harvest during 1993-1997. The West Cook Inlet Management Unit contribution to the total NCIMA was 4% during this time period.

A description of these management units, including access to these areas, is presented in the chinook salmon section of this report. Coho salmon returning to these units are early-run stocks which begin to enter these drainages about mid-July. The migration into the Yentna River drainage (Susitna River Mile 28, Westside Susitna Management Unit) normally peaks the last week in July, whereas the peak passage into the Talkeetna River (Susitna River Mile 99, Eastside Susitna Management Unit) takes place 7 to 10 days later. Few coho salmon enter the Susitna River after early September. Most spawning occurs between mid-September and mid-October. Little information is available regarding West Cook Inlet Management Unit coho salmon run timing; however, it is assumed to be similar to that of the Susitna River.

Total coho salmon abundance in the Susitna River drainage has not been estimated. Abundance in portions of this vast drainage has been measured by sonar, fish wheels, weir, and mark-and-recapture methods. During the period 1981 through 1983, coho salmon abundance was estimated to average 47,000 fish in the Susitna River excluding all systems below River Mile 80 (Table 40). It is important to recognize that significant coho salmon returns occur in tributaries that enter the Susitna River downstream from River Mile 80. Coho salmon abundance in such

systems as the Deshka River, Alexander Creek, and Willow Creek, as well as many other important coho salmon sport fisheries, was not measured during the 1981-1983 studies.

Coho salmon abundance in the Yentna River has been estimated by side-scan sonar and fish wheels since 1981. Estimates made during 1981-1984 and 1997-1999 encompassed the entire coho salmon migration. From 1985 to 1996 the sonar program was terminated prior to the end of the coho salmon return. Yentna River sonar enumeration of coho salmon entering the Yentna River drainage ranged from 6,279 to 74,346 fish during 1981 to 1999 (Table 40). The number of coho salmon passing River Mile 80 on the Susitna River exceeded the number of coho salmon entering the Yentna River each year during the period 1981 to 1983. Side-scan sonar to enumerate salmon, and fish wheels to apportion sonar counts by species, may not be adequate tools to estimate abundance of coho salmon. Coho salmon only make up a small portion of the fish wheel catch and any error in species apportionment of the sonar count using the fish wheel catch may result in a large error in the coho salmon estimate. Additionally, coho salmon may be distributed across the entire river while the sonar only counts fish swimming along riverbanks.

Very little information is available regarding coho salmon spawning abundance in the West Cook Inlet Management Unit. No coho salmon escapement information has been collected by the department during recent years in this management unit.

The Deshka River, Alexander Creek and Lake Creek are the major Westside Susitna Management Unit coho salmon fisheries. Coho salmon harvest from these three streams averaged 4,078, 1,584 and 3,233 fish, respectively, during the period of 1993 to 1997. This harvest accounted for 61% of the Westside Susitna Management Unit coho salmon harvest during this time period (Appendix A16). Beginning in 1996 a fish wheel fishery has operated on the Yentna River below the Skwentna River resulting in harvests of less than 150 coho salmon each year. This fishery originated as a personal use fishery, then was reinstated as a subsistence fishery in 1998.

Coho salmon were counted through a weir at approximately River Mile 17 on the Deshka River during 1995 and 1996. During 1996 the weir was operational only through July 30, after which high water made counting fish impossible. In 1997 the weir was moved downstream to RM 7 to enumerate a larger portion of the escapement and allow weir crews easier access.

All the Eastside Susitna Management Unit tributaries provide fishing opportunities for coho salmon. During recent years Willow Creek and the Talkeetna River have produced the largest coho salmon harvests in this management unit, averaging 4,347 and 5,735 fish, respectively, during 1993 through 1997 and accounting for 49% of the Eastside Susitna harvest (Appendix A14).

In the West Cook Inlet Management Unit the Chuitna River is the primary producer of coho salmon. The average harvest in this stream between 1993 and 1997 was estimated at 1,169 fish which accounts for approximately 45% of the harvest within this management unit (Appendix A18).

Coho salmon sport fishing is permitted throughout the year at most sites. However, portions of several Eastside Susitna Management Unit fisheries are closed to salmon fishing to protect spawning fish. Closures usually include upper reaches of tributaries that are road accessible.

Flowing waters of major tributaries, or portions of tributaries, within the Susitna River drainage are restricted to unbaited, single-hook artificial lures throughout the year. These regulations are implemented as part of special management regulations for rainbow trout under the Cook Inlet and Copper River Basin Rainbow/Steelhead Trout Management Policy. Under this policy, only unbaited artificial lures may be used from September 1 through May 15 in all flowing waters of the Susitna River drainage. Additionally, bait is prohibited from May 15 through July 13 in waters open to chinook salmon fishing. Exceptions have been made for fishing for burbot when legal burbot fishing gear is used.

In the Eastside Susitna Management Unit, the bag and possession limits for coho salmon were three fish 16 inches or more in length until 2000 when they were reduced to two. In the Westside Susitna and West Cook Inlet Management units the bag and possession limits were three coho salmon daily and six in possession until 2000 when they were reduced to two per day and four in possession. These reductions were instituted to address conservation concerns.

Susitna River coho salmon are harvested in commercial fisheries located in the Northern and Central Districts of Cook Inlet. In the Northern District, commercial fishing is not permitted within 500 yards of the terminus of the Susitna River and several of the West Cook Inlet Management Unit streams. Commercial fishing is not permitted within 1 statute mile of the terminus of several other West Cook Inlet Management Unit streams including Threemile Creek, Chuitna River, Nikolai Creek and the McArthur River. Significant numbers of Susitna River and West Cook Inlet drainage coho salmon are harvested in the mixed-stock driftnet fisheries which occur in the Central District during July and early August (Appendix B3).

### **Recent Fishery Performance**

The 1998 recreational coho salmon harvest from the Eastside Susitna, Westside Susitna and West Cook Inlet units was estimated at 27,635, 15,444 and 4,029 fish, respectively (Table 31). The 1998 harvest was well above the 1993-1997 mean for the Susitna River units and approximately double the 1997 harvest.

In 1999 initial catches from the Central District commercial drift fleet for coho salmon were low; however, it was thought that this was partly due to poor fishing conditions caused by high winds. As the season progressed commercial catches remained poor. Total commercial catch for the Northern Cook Inlet was 120,083 fish, the lowest on record in over two and a half decades. Actions were taken by the department through its E.O. authority to increase the number of Susitna River-bound sockeye salmon to the spawning grounds. This action undoubtedly increased the number of coho bound for Northern District waters; however, the increased savings of coho was much smaller than anticipated. An additional E.O. was issued to increase coho salmon inriver returns to the Northern District.

During the 1999 season catch information received from recreational anglers and guides for the Westside Susitna Unit indicated a fair to average return of coho salmon. Fair to good catches were reported for most of the major tributaries including Alexander and Lake creeks and the Deshka and Talachulitna rivers. Weir counts for the Deshka River appeared low at 4,563; however, it is thought that an additional 1,000-2,000 coho salmon may have passed the weir without being counted due to high water (Table 40). Sonar enumeration of coho salmon at River Mile 4 of the Yentna River estimated a return of 37,933 coho salmon to the Yentna River drainage in 1999, the third highest count recorded since 1981 (Table 40). However, it is unknown if this is an accurate representation of the coho escapement as there are questions about the migration pattern of coho within the river. During the Skwentna River Subsistence Fish Wheel fishery in 1999, twenty-one permits were issued and two fish wheels were operated. A total of 43 coho salmon was harvested (Table 20).

Catch information from fishermen and guides combined with periodic spot checks of the sport fishery by area staff indicated an average to above average return of coho to Eastside Susitna Unit. Although a few anglers reported poor catches of coho salmon for some of the Parks Highway streams, most reports indicated average to good catches. This was true for the Talkeetna area streams as well. There are currently no departmental programs available to monitor inseason returns of coho salmon to Eastside Susitna streams. The department does, however, conduct escapement surveys to index spawning numbers of coho salmon on three area streams (Table 40).

Currently there are no departmental programs available to monitor inseason runs of coho salmon to West Cook Inlet streams. However, inseason catch information received in 1999 from recreational anglers and guides indicated an average to above average return. Good numbers of coho salmon were observed in the Chuitna, Theodore and Lewis rivers by staff when conducting aerial surveys to index chinook salmon abundance. In addition, information provided from a helicopter charter service catering to anglers also indicated good numbers of coho salmon were present.

#### **Recent Board of Fisheries Actions**

During the February 1999 BOF meeting the following proposal was adopted: In all waters of West Cook Inlet South of the Susitna River (i.e. Chuitna, Lewis, Theodore & McArthur rivers) once an angler has harvested their bag limit of three coho salmon, they may no longer fish on these streams for the remainder of the day. These same streams are closed to coho salmon fishing commencing October 1-December 31.

The BOF met out of cycle in February of 2000 to address a coho salmon conservation concern. During this meeting several restrictions were imposed on commercial and sport fisheries to reduce coho salmon harvests beginning in 2000. In the Eastside Susitna Unit the daily bag and possession limits were reduced from three coho salmon to two. In the Westside Susitna Unit and West Cook Inlet Unit the bag and possession limits were reduced from three per day and six in possession to two per day and four in possession.

The next BOF meeting regarding coho salmon issues is scheduled for February 2002.

## **Current Issues**

Allocation of coho salmon between commercial and recreational fisheries remains a controversial issue. The popularity of these fisheries has increased in previous years and managers' lack of information regarding stock status makes management decisions difficult.

In the Eastside and Westside Susitna Management Units, four small Susitna River tributaries continue to be included in the annual coho salmon escapement indices. These are Question Creek, Answer Creek, Birch Creek and Rabideux Creek (Table 40). These coho salmon spawning streams enter the Susitna River drainage between River Mile 80 and 85. They are indexed because of their accessibility from the road system. The escapement to these small streams is small and fish are often blocked from reaching the index area by beaver dams. It is often unknown if an absence, or very low numbers of spawning fish, in these streams is due to a downstream blockage or is a reflection of abundance trends in the Susitna River drainage.

Returns of coho salmon to Alexander Creek and the Deshka River during the 1996 and 1997 seasons were at historic lows based on catch rates and angler comments. Speculation suggests that high northern pike concentrations may have had a negative impact on juvenile coho salmon production.

Issues relating to large scale timber development, recreational river management, and road and boat launch construction are of importance in developing future use and management strategies for coho salmon in these management units.

## **Ongoing Research and Management**

Sonar and fish wheel enumeration of Yentna River coho salmon is performed by the Division of Commercial Fisheries; however, this enumeration project is directed primarily toward sockeye salmon. Investigations were conducted during the 1998 season to determine the accuracy of enumerating Yentna River coho salmon by sonar. Findings from this study will be presented by the Commercial Fisheries Division. Commercial Fisheries Division also operates weirs at Chelatna, Judd and Packers lakes that indicate small numbers of coho salmon return to these systems.

Coho salmon are counted through a weir at River Mile 7 on the Deshka River and by foot survey in four Susitna River tributaries between River Mile 80 and 85.

The Susitna River coho salmon sport harvest and catch is estimated annually by the SWHS. Effort is not estimated specific to a species but across all species for a specific drainage or group of drainages.

## **Recommended Research and Management Activities**

Methods should be established to estimate returns of spawning coho salmon to the Susitna River and West Cook Inlet. Coho salmon stocks of concern are road-accessible Eastside Susitna Management Unit streams including Willow, Sheep, Montana, and Birch creeks and the Kashwitna River. Fisheries in these streams have become considerably more popular than in previous years (Appendix A14).

The weir which has been operated annually on the Deshka River since 1995 will be operated in 2000 at RM 7. Sport harvest estimates of coho salmon will be taken from the SWHS.

Currently we believe that wild coho salmon are exploited at the same rate as NCI hatchery released coho salmon. This assumption should be tested by implementing a wild coho salmon smolt marking program. Tag recoveries would be made in the Cook Inlet commercial and recreational fisheries.

An investigation of Alexander Creek in the Westside Susitna Management Unit should be conducted to determine the reason for low coho salmon production in recent years. We recommend the feasibility of constructing a weir in Sucker Creek (a tributary of Alexander Creek) be addressed in 2000.

A method for annually indexing abundance of coho salmon in the Susitna River drainage is badly needed. We don't know if an absence or low numbers of spawning coho salmon indexed in small road accessible Susitna River tributaries reflects instream problems such as blockage by beaver dams or overall low numbers returning to the drainage. Because of this uncertainty, it is important that projects that give a more complete picture of coho salmon abundance in the Susitna River drainage, such as the Deshka River weir, be maintained to assist management of this important recreational species. New projects would be costly and at this point in time funding for programs of this magnitude is not likely to be appropriated.

Additionally, it should be determined if projects such as the Yentna River sonar, operated by the Commercial Fisheries Division (CFD), could be used to accurately estimate the escapement of coho salmon.

Access development, acquisition, and maintenance programs for these areas are discussed under the chinook salmon section of this report.

## **SOCKEYE SALMON FISHERIES**

### **Background and Historical Perspective**

Recreational harvests of sockeye salmon in the NCIMA ranged from 3,140 to 21,423 fish during 1977-1997 and averaged 11,452 fish (Mills 1979-1994; Howe et al. 1995-1998) (Table 7). Within the NCIMA, the Knik Management Unit accounts for the largest harvest of sockeye salmon. The Eastside Susitna Management Unit is second followed by the Westside Susitna Management Unit. The West Cook Inlet Management Unit, with fewer accessible streams, is a distant fourth in average harvest. Knik Management Unit harvests have been dominated by the Little Susitna River, while Eastside Susitna River Unit harvests have been dominated by the Talkeetna River, specifically Larson Creek. Westside Susitna River and WCI units harvests have been spread across several systems (Appendices A25-A28).

Fish Creek (Knik Arm) sockeye salmon have long been used in commercial and subsistence fisheries (Engel and Vincent-Lang 1992). The Knik Arm subsistence fishery was operational through 1970. In 1971 it was closed because of declining sockeye salmon escapements into Fish Creek. It reopened in 1984 and 1985 then closed again in 1986. The Board of Fisheries established the Skwentna Fish Wheel Personal Use fishery in March of 1996, then reestablished it as a subsistence fishery in 1998 (Table 20). Sockeye salmon dominate these harvests.

The Fish Creek commercial set gillnet and personal use dip net (Table 38) fisheries along the northwest shore of Knik Arm were initiated by the Board of Fisheries in 1986 to use sockeye salmon surplus to spawning and egg take needs. These fisheries continue annually, contingent upon a projected escapement of 50,000 Fish Creek sockeye salmon. The dip net fishery was

initially established to open July 30, but several changes have occurred in subsequent BOF meetings. Most recently the Fish Creek dip net fishery was modified under the Upper Cook Inlet Salmon Fisheries Management Plan and the current fishery is open from July 10-July 31.

The Upper Cook Inlet Subsistence Management Plan provided for a subsistence set gillnet fishery in Northern Cook Inlet waters in 1991, 1992 and 1994 which targeted sockeye salmon (Table 21). The threat of a court-ordered closure of this subsistence fishery for the 1995 season caused the BOF to take action to allow the fishery to proceed as a personal use fishery (Table 21). The gillnet personal use fishery in marine waters in the Northern District of Upper Cook Inlet was eliminated prior to the 1996 season by BOF action.

Sockeye salmon populations are present in numerous streams throughout the Knik Arm Unit, some of which have been surveyed sporadically during past years (Tables 41 and 42). Bodenbug Creek, a Knik River tributary, has been surveyed annually since 1968 (except for 1984) (Table 41).

The escapement of sockeye salmon into the Fish Creek drainage has been documented since 1936 (Chlupach and Kyle 1990). Recorded escapement of these late-run sockeye salmon ranged from 2,705 fish in 1973 to 307,000 fish in 1940. Since 1968 the escapement of sockeye salmon has ranged from the 1973 low of 2,705 fish to a 1984 high of 192,352 fish (Table 42, Figure 20). Due to declining abundance during the early 1970s, enhancement of Fish Creek sockeye salmon was initiated in 1975. The Big Lake state fish hatchery supported the sockeye salmon enhancement program through 1992 using Fish Creek stock as brood (Table 43). After the Big Lake hatchery closed in 1993, enhancement continued using Fish Creek stock as brood reared at the Eklutna fish hatchery, a private hatchery operated by Cook Inlet Aquaculture Association (CIAA), located on the Knik River in the Eklutna powerplant tailrace. The CIAA discontinued operation of the Eklutna Hatchery in 1998, at which time the program was switched to the Trail Lakes Hatchery, another CIAA facility. Current production goals are 9 million sockeye salmon eggs of Fish Creek brood, from which sockeye salmon fry are released annually into the Big Lake drainage. An additional 1.5 million fry were retained in 1997 for further rearing and release as smolt into the Eklutna tailrace.

Escapement of sockeye salmon to the Susitna River drainage has been documented annually since 1978 at the Yentna River sonar site operated by the Commercial Fisheries Division, and by CIAA weirs at Chelatna Lake (Lake Creek drainage) since 1993, Larson Lake (Talkeetna River drainage) in 1984-1987 and since 1997, and Hewitt Lake in 1990 (Table 42). Within the NCIMA the department also operates a weir at Packers Creek on Kalgin Island.

As more data have become available concerning the northern pike invasion of the Susitna River drainage, their effect on sockeye salmon populations has become evident. A detailed listing of sockeye salmon populations affected in streams and lakes of the NCI is included in the northern pike section of this report.

### **Recent Fishery Performance**

The 1998 sport harvest of sockeye salmon in the Knik Management Unit totaled 5,812 fish, well above the 1993-1997 mean of 4,977. The majority of the harvest occurred in the Knik River and Cottonwood Creek (Appendix A21). Harvests from Eastside and Westside Susitna River units totaled 6,481 and 2,940 fish, respectively (Appendices A23 and A25). The 1998 Eastside Susitna Management Unit was approximately 50% above the 1993-1997 mean while the

Westside Susitna Unit exceeded its 1993-1997 mean by approximately 25%. WCI Unit streams produced a harvest of 582 fish, approximately 40% above their 1993-1997 mean (Appendix A27).

Sockeye salmon were sampled for age, sex and length at weirs operated on Cottonwood, Wasilla and Fish creeks during 1999. Data pertaining to age and sex composition and length-at-age are contained in Appendix L.

<sup>b</sup> Additional fry retained for smolt program.

<sup>c</sup> 100% otolith marked.

The Fish Creek personal use dip net fishery harvested only 4,036 sockeye in 1998. Emergency orders were issued closing the fishery early. The 1999 Fish Creek personal use fishery again had to be closed early by emergency order in hopes of attaining the escapement goal (Appendix D1). A preliminary harvest estimate totals only 902 sockeye salmon in 1999.

The Tyonek subsistence harvest during 1998 and 1999 totaled 127 and 145 sockeye salmon (Table 20). The Yentna River Subsistence Salmon Fishery harvested 473 and 455 sockeye salmon in 1998 and 1999, respectively (Table 20). Educational permit holders harvested approximately 300 and 350 sockeye in 1998 and 1999, respectively.

### **Management Objectives**

The management objective for sockeye salmon in the NCIMA is to attain established escapement goals as measured at various weirs and sonar sites while harvesting fish in excess of these escapement goals.

### **Recent Board of Fisheries Actions**

The next BOF meeting addressing sockeye salmon is scheduled in 2002.

### **Current Issues**

Currently the recreational fishery for sockeye salmon is incidental to the harvest of other salmon. However, directed sockeye salmon fisheries occur at Larson Creek in the Talkeetna River drainage, Nancy Lake Creek in the Little Susitna River drainage, Lake Creek, and the Talachulitna River. With the area-wide reduction of the coho bag and possession limits, managers anticipate the harvest of NCIMA sockeye salmon will increase as anglers begin targeting them to supplement their harvests.

### **Ongoing Research and Management Activities**

Fish Creek escapement is monitored by a weir located approximately 3 miles from the outlet of Fish Creek into Knik Arm. The Fish Creek drainage is scheduled to be stocked annually with sockeye salmon fry from a CIAA hatchery. Weirs on Cottonwood and Wasilla creeks have been in operation the past 3 years primarily for coho salmon enumeration, but have allowed the opportunity to monitor the sockeye salmon return also.

Susitna River escapement is monitored at a sonar site on the Yentna River operated by the Commercial Fisheries Division. Additionally, weirs are operated at Chelatna and Larson lakes by CIAA, and Packers Creek and Judd Lake by the Commercial Fisheries Division.

### **Recommended Research and Management**

Expansion of existing sockeye salmon escapement monitoring programs is recommended. Specifically, we need to refine and evaluate the Yentna River sonar and to evaluate the distribution of spawning sockeye salmon upstream of the sonar site.

## **PERSONAL USE AND SUBSISTENCE FISHERIES**

### **Background and Historical Perspective**

In 1978, the State of Alaska passed its first subsistence statute, 5 AAC 16.05.258, which gave priority to subsistence uses of fish and game resources over other uses. Sockeye salmon is the predominant harvest in these fisheries. Brannian and Fox (1996) provide a detailed history of subsistence and personal use salmon fishing in Upper Cook Inlet. Currently, the only areas open to subsistence fishing in Upper Cook Inlet are the Tyonek Subdistrict on the west side of Cook

Inlet in the Northern District, and a fish wheel fishery in the Yentna River near the community of Skwentna. Additionally, there is a personal use dip net fishery in Fish Creek and a personal use smelt fishery, the majority of which takes place in the Susitna River.

Fish Creek sockeye salmon have long been used in commercial and subsistence fisheries (Engel and Vincent-Lang 1992). The Knik Arm subsistence fishery was operational through 1970. In 1971 the fishery was closed because of declining sockeye salmon escapements into Fish Creek. It was reopened in 1984 and 1985, then closed again in 1986.

The Fish Creek commercial set gillnet and personal use dip net fisheries along the northwest shore of Knik Arm were initiated by the Board of Fisheries in 1986 to use sockeye salmon surplus to spawning and egg take needs. These fisheries continued annually, contingent upon a projected escapement of 50,000 Fish Creek sockeye salmon. Closure of the commercial fishery after July 26 was mandatory to prevent an excessive interception of coho salmon. In 1989 the period these fisheries were open to harvest sockeye salmon was modified to reduce conflict between the two user groups. On projection of a 50,000 sockeye salmon escapement to Fish Creek, the commercial fishery is allowed from July 15 through July 26. Fishing periods are Tuesdays and Sundays from 7:00 a.m. to 7:00 p.m. Due to low returns in 1997 and 1998, the BOF closed this fishery for the 1999 through 2001 fishing seasons.

The dip net fishery was initially established to open July 30, but several changes have occurred since 1986. Most recently the Fish Creek dip net fishery was modified under the Upper Cook Inlet Salmon Fisheries Management Plan and the current fishery is open from July 10-July 31. A permit is required, with a limit of 25 fish for the head of household plus 10 fish for each additional member of the household. These permits must be returned with the total catch recorded. The closing date is set to limit the number of coho salmon harvested.

The Upper Cook Inlet Subsistence Management Plan provided for a subsistence set gillnet fishery in Northern Cook Inlet waters in 1991, 1992 and 1994 (Table 21). Subsistence set gillnet fishing was allowed for a total of 17 days between May 21 and September 28. A subsistence set gillnet fishing day in Northern Cook Inlet was from 8:00 a.m. until 8:00 p.m. The threat of a court-ordered closure of this subsistence fishery for the 1995 season caused the BOF to take action to allow the fishery to proceed as a personal use fishery (Table 21). The gillnet personal use fishery in marine waters in the Northern District of Upper Cook Inlet was eliminated prior to the 1996 season by BOF action.

The overwhelming majority of the personal use smelt harvest comes from the Susitna River drainage. Most of this harvest occurs in and around the mouth of the Susitna River and in the mainstem Susitna River downstream of the Yentna/Susitna confluence (Appendices A82 and A83). The average harvest from 1993–1997 was 6,058. The inriver return of smelt to the Susitna River drainage ranges in the millions with personal use harvest accounting for less than 1% of this return. In terms of harvest, this fishery is likely one of the most underutilized in the state. It is managed inseason with spot checks conducted by Palmer Area staff and postseason through the SWHS. It is likely that unless increased access is provided to the Susitna River, the personal use harvest for smelt will remain fairly stable.

The Board of Fisheries established the Skwentna River Personal Use Salmon Fishery in March of 1996. As a result of State of Alaska Supreme Court and Board of Fisheries action, it was reinstated as the Upper Yentna River Subsistence Salmon Fishery beginning in 1998. The

fishery occurs in the mainstem Yentna River from its confluence with Martin Creek upstream to its confluence with the Skwentna River and is prosecuted strictly by fish wheel. Most of the participants are local residents from the Skwentna area. The season is from July 15 through July 31, from 4:00 a.m. until 8:00 p.m. on Mondays, Wednesdays and Fridays. Sockeye salmon dominate the harvest and chinook salmon harvest is not allowed. The number of permits returned per season ranged from 14 in 1996 to 21 in 1998, and averaged 18. Average annual harvest is 571 fish (Table 20).

The Tyonek subsistence fishery was established in 1980. Participants are allowed to harvest all species of salmon. Tyonek natives are the primary users. The season commences on May 15 and continues through October 15. Chinook salmon dominate the harvest while coho and sockeye salmon are harvested in similar numbers. Few pink and chum salmon are harvested. The average harvest from 1980–1999 was 1,569 chinook, 122 sockeye, 120 coho, 16 pink and 11 chum with an average overall harvest of 1,569 salmon (Table 20).

### **Recent Fishery Performance**

The Fish Creek personal use dip net fishery presently is restricted to the waters of Fish Creek and limited to the hours of 11:00 a.m. to 11:00 p.m. daily. As in 1997, the 1998 fishery had to be closed early by emergency order in hopes of attaining the escapement goal (Appendix D1). However, even with this action in 1998, only 22,865 sockeye salmon were counted at the weir, less than half the desired escapement (Table 42). The 1998 harvest estimate of the personal use fishery totaled only 4,036 sockeye salmon.

The 1999 season commenced on July 10 and periodic onsite inspection by staff indicated that dipnetting was poor. No fish showed up at the Fish Creek weir until July 26, indicating that most of the fish harvested in the dip net fishery were not of Fish Creek origin. In response to low weir counts and poor catch rates the department, though E.O. authority, closed the fishery on July 26. The preliminary harvest estimate generated from returned permits was 902 sockeye. Additionally, low returns in 1997 and 1998 prompted the BOF to close the Fish Creek commercial setnet fishery through the year 2001. The cause of poor sockeye salmon returns to the Fish Creek system is currently unknown. Increased urbanization within the system may be a contributing factor.

The 1998 personal use smelt harvest was 7,865 fish, 33% above the 1993-1997 mean. The 1999 harvest is thought to have been average.

Twenty-one permits were issued for the 1999 Upper Yentna River Subsistence fishery, down slightly from 1998 (Table 20). In 1999 the average salmon harvest per permit was 32, approximately equal to the 1996-1998 average of 31 fish. Total harvest for 1999 was 524 fish of which 455 were sockeye salmon, 43 coho salmon, 15 pink salmon and 11 chum salmon.

The 1999 Tyonek subsistence fishery harvest estimate totaled 1,585. Harvest by species was 1,314 chinook; 145 sockeye; 91 coho; 26 pink and 9 chum salmon (Table 20).

## **Management Objectives**

The management objective of the Fish Creek personal use fishery is to allow escapement of sockeye salmon along the entire course of the return while harvesting fish in excess of the 50,000 escapement goal. The fishery is designed to target primarily sockeye salmon, terminating prior to the peak of the coho salmon return. Regulation and management of this fishery are governed by the Upper Cook Inlet Personal Use Salmon Fishery Management Plan.

There are no specific management objectives for the personal use smelt fishery, Tyonek subsistence fishery or the Upper Yentna River subsistence fish wheel fishery. However, all fisheries are managed to provide sustained yield.

## **Recent Board of Fisheries Actions**

Prior to the 1998 season, State Supreme Court and BOF action replaced the Skwentna River Personal Use Fishery with the Upper Yentna River Subsistence Salmon Fishery.

The next BOF meeting addressing Cook Inlet finfish is scheduled in 2002.

## **Current Issues**

The Fish Creek Dipnet Fishery has closed early because of poor returns of sockeye salmon for 3 years in a row. The cause of the poor returns is presently unknown.

Much of the land adjacent to the Fish Creek Dip Net fishery is under private ownership causing annual conflict between fishery participants and landowners. Due to the large number of people participating in the fishery there is conflict between shore and boat fishermen, litter accumulation and substantial short-term damage to the marsh area near the mouth of Fish Creek. These problems are the source of increasing comment by the public and local landowners. The department presently provides toilets and a dumpster to alleviate the litter problem.

## **Ongoing Research and Management Activities**

Department markers and regulatory signs are placed at the mouth of Fish Creek to delimit the legal fishing area and list the present regulations.

Fish Creek escapement is monitored by a weir located approximately 3 miles from the outlet of Fish Creek into Knik Arm. The Fish Creek personal use harvest is estimated by the SWHS, and with the return of personal use permits with harvest recorded. The Fish Creek drainage is scheduled to be stocked annually with sockeye salmon fry from a CIAA hatchery.

Susitna River escapement is monitored at a sonar site on the Yentna River operated by the Commercial Fisheries Division. Harvest information for the Upper Yentna and Tyonek subsistence fisheries is collected from returned permits as required by the permitting process. Harvest information for the personal use smelt fishery is collected through the SWHS.

## **Recommended Research and Management**

Department markers will continue to be placed at the mouth of Fish Creek. Placement of signs to inform participants of fishery regulations and fish identification techniques will continue. As with most fisheries in this management area, increased enforcement would provide for a more orderly fishery.

The department will continue to operate the weir on Fish Creek as long as the personal use fishery exists. It is likely that more restrictive measures will be necessary in the Fish Creek

personal use fishery in 2000 as escapement goals have not been met the past 2 years and inseason E.O. closures were necessary.

Department markers will continue to be placed at the boundaries of the Upper Yentna River subsistence fishery area.

## **EDUCATIONAL FISHERIES**

### **Background and Historical Perspective**

The first educational fishery, the 1989 Kenaitze Tribal fishery (on the Kenai Peninsula), originated as a Federal Court-ordered subsistence fishery resulting from extensive legislation and litigation related to both state and federal interpretation of subsistence. Prior to the 1993 fishing season the Alaska Superior Court, in negotiations with the department and the Kenaitze Tribe, ordered the department to issue educational fishing permits. The Knik Tribal Council and the Native Village of Eklutna were first issued permits for the 1994 season. In 1998 the Tyonek Subsistence Camp was issued its first permit. These educational fisheries, originally ordered as an interim fishery until the court cases were decided, have been applied for and renewed by the department annually.

The guidelines for educational fisheries were established by the BOF and are administered under chapter 93 of the Alaska Administrative Code. Only 1,000 fish per permit are allowed. The season is from May 1 to September 30. These permits are issued on an annual basis and must be renewed each year. Permit holders must submit to the department a postseason summary as indicated in the specifications. A failure to meet specifications will result in nonrenewal of a permit. The average number of fish harvested each year per permit is approximately 200.

### **Recent Fishery Performance**

The Knik Tribal Council educational permit harvest has averaged 207 fish per year. During the 1999 season approximately 394 salmon were harvested. Sockeye salmon dominated the harvest with 177 fish; 120 coho salmon, 55 chum salmon and 42 chinook salmon were also harvested (Table 44).

The Eklutna Native Village educational permit harvest has averaged 179 fish annually. The 1999 season was slightly below average with 139 fish being harvested. Sockeye salmon dominated the harvest with 80 fish, followed by chinook salmon with 11, 25 coho, 20 chum, and 3 pink salmon (Table 44).

The Tyonek Village educational permit harvest was 56 in 1998, the first permitted year. During 1999 the harvest nearly doubled to 100 fish. All fish harvested in 1999 were reported as sockeye salmon (Table 44).

### **Management Objectives**

The objective of this fishery is to implement the provisions of the permit. Standards, general conditions, and requirements of an educational fishery program are outlined in 5 AAC 93.200-235. Council and Tribal objectives for the educational fisheries include teaching and preserving the cultural and traditional subsistence way of life as well as providing food for the elders and others in need.

### **Recent Board of Fisheries Actions**

The Board has not recently addressed this fishery.

**Table 44.-Educational fishery permit harvests in NCIMA, 1991-1999.**

<sup>a</sup> No data available

### Current Issues

The educational fishery harvests of all species of salmon are minimal and have an insignificant effect on the inriver sport fisheries.

### Ongoing Research and Management Activities

Reports on the educational program, as required by each permit, have been submitted annually to the Area Biologist and compiled in the Area Management Report.

### Recommended Research & Management

No research activity specific to this fishery is recommended. The annual permit data should continue to be compiled.

## STOCKED LAKE FISHERIES

### Background and Historical Perspective

Currently 76 lakes in the NCIMA are stocked on an annual, biennial, or triennial basis, including one research lake that is closed to fishing (Appendix C1). These lakes range in size from 2 to 362 surface acres and are stocked with a variety of sizes and species of game fish including: rainbow trout, coho salmon, chinook salmon, Arctic grayling, Arctic char, lake trout and recently a chinook salmon and pink salmon hybrid (pinook).

The stocking program began in 1952 when two lakes received 22,000 rainbow trout fry. Although eight species of salmonids have been planted since 1952, rainbow trout, coho salmon, Arctic char and Arctic grayling have become the primary species used in the stocking program. Steelhead/rainbow trout from the Karluk River (Kodiak) and four strains of Alaska rainbow trout (Naknek River, Talarik Creek, Swanson River and Big Lake) as well as rainbow trout from federal and private hatcheries located in the states of Idaho, Montana, Oregon and Washington have been stocked. Landlocked salmon fisheries have been supported by coho salmon from Washington State and at least nine Alaskan egg take sources, and chinook salmon from three Alaskan sources. Since 1979 only native Alaskan fish have been stocked in the NCIMA. Arctic grayling egg-take sources have been Junction Lake, Tolsona Lake and Moose Creek. Arctic char, originating from egg takes at Aleknagik Lake, and lake trout from Paxson Lake were first stocked in 1988.

The final egg take from Big Lake strain rainbow trout brood stock at Fort Richardson Hatchery took place in 1993. All resulting fingerling were stocked in Big Lake drainage lakes and all remaining brood stock were stocked in Anchorage area landlocked lakes and in Big Lake. Swanson River strain rainbow trout are the sole rainbow trout brood stock source remaining at the Ft. Richardson Hatchery. Beginning in 1994, Big Lake drainage system lakes having intermittent outlets have been stocked with triploid all-female Swanson River strain rainbow trout.

In most cases stocked landlocked lakes represent new fisheries because game fish were not present before stocking occurred. Stocked lakes benefit anglers and recreational support industries by providing diverse, year-round fishing opportunities and by diverting angling pressure from natural stocks. The majority of the stocking is directed toward road-accessible lakes that tend to draw entire family groups for some combination of fishing, camping, picnicking, boating, snowmachining and ice skating.

Rainbow trout appear to be the species preferred by most anglers. A survey of anglers fishing stocked lakes in the NCIMA in 1977 (Watsjold 1978) revealed that 70% preferred to fish for rainbow trout, 19% desired landlocked coho salmon and 11% listed Arctic grayling as their choice. Rainbow trout comprised 58% of all fish stocked in landlocked lakes within the NCIMA during the period 1993 through 1999. Annual releases of all species during 1997-1999 ranged from 489,532 to 732,731 (Appendix C1).

The majority of rainbow trout released into NCIMA waters during the period 1997-1999 were fingerlings. Most fingerlings weighed between 1 and 2 grams and were released during July and August. By June of the year following introduction, fingerlings at age 1 will typically range from 3 to 6 inches in length, at age 2 from 6 to 11 inches, at age 3 from 11 to 16 inches, and at age 4 from 16 to 20 inches in length. Approximately 70% to 80% of the rainbow trout harvested from stocked lakes are age 2 and about 15% to 20% are age 3. Few stocked rainbow trout exceed age 4 and relatively few rainbow trout achieve harvestable size prior to age 2 (Havens et al. 1995).

Catchable rainbow trout, weighing about 100 grams, are stocked to supplement rainbow trout production resulting from fingerling plants. These larger fish provide angling opportunities in nonproductive lakes and help maintain good catch rates in heavily fished lakes. Fifteen percent of the rainbow trout stocked in the NCIMA are catchable size at introduction.

Coho salmon are normally stocked in May at about 3 to 5 grams each. These fish achieve a harvestable size (6 to 11 inches) at age 1, the year following introduction. Most coho salmon are either harvested or die after becoming sexually mature by age 3. Stocked salmon support important winter fishing opportunities within the NCIMA.

Arctic grayling are stocked in September as fingerlings weighing 3 to 5 grams or as subcatchables weighing 40-70 grams. Arctic grayling normally recruit into the harvest by age 2.

King salmon are stocked as catchables, weighing about 100 grams, in early November providing winter ice fishing opportunities in three heavily fished lakes.

Arctic char are stocked as catchables weighing about 100 grams in May in seven lakes (Appendix C1), providing more diversity for sport fishing.

Although the contributions from the landlocked lake stocking program have been significant to date, it is important to recognize that poor survival of stocked fish has also been documented. Research investigations have accompanied development of the area's stocking program since the early 1970s. The primary objective of this research has been to develop cost-effective stocking practices that provide both expanded and diverse fishing opportunities. Lake stocking research has been directed toward but not limited to the following: evaluation and selection of rainbow trout brood stock, development of effective stocking densities and size of stocked fish for various lake environments, establishment of optimal time and frequency of stockings in various landlocked lake environments, evaluation of sterile coho salmon and rainbow trout for stocking lakes that have open or intermittent linkage with drainages that support wild fish, and evaluation of female diploid rainbow trout to eliminate high mortality associated with spawning males (Bentz et al. 1991).

### **Recent Fishery Performance**

In 1999, 68 lakes were stocked with 612,776 game fish (Appendix C1). The majority of these lakes are located in the Knik Arm Management Unit and the remainder in the Eastside Susitna Management Unit. Releases in 1999 included 473,284 rainbow trout; 91,199 coho salmon; 17,465 Arctic char; 322 Arctic grayling; and 30,456 chinook salmon. Eighteen lakes were stocked with more than one species of fish in 1999. Stocking locations, species, numbers of fish and fish size are listed in Table 45.

The SWHS (Howe et al. 1999) estimated that 22,196 angler-days of participation resulted from the area's landlocked stocking program in 1998 (Table 46). Fishing effort at lakes having both stocked and indigenous game fish is not included in estimates of participation associated with lake stocking. The 1998 catch from stocked landlocked lakes included an estimated 40,447 rainbow trout of which 11,184 were harvested, 9,955 landlocked salmon (4,332 were harvested); and 4,350 Arctic grayling (723 were harvested). Rainbow trout from stocked lakes represented 35% of all rainbow trout caught and 55% of the entire harvest of this species from the NCIMA during 1998 (Tables 46 and 47).

**Table 45.-Northern Cook Inlet Management Area lake stocking summary for nonanadromous fish, 1999.**

<sup>a</sup> Treatment: AF = diploid all-female; TAF = triploid all-female.

<sup>b</sup> Stocking Method: T = tank truck; T/BU = carried in buckets to lake; A = airdrop.

The Kepler Lake Complex, consisting of nine stocked lakes, supported 7,732 angler-days of effort, and Finger Lake supported 5,329 angler-days of effort in 1998 (Table 46). Collectively, these two sites yielded 59% of the effort associated with stocked landlocked lakes within the NCIMA (Howe et al. 1999).

### Management Objectives

The primary objective of this program is to provide additional fishing opportunities in a cost effective manner on a sustainable basis by stocking lakes with game fish that are indigenous to Alaska. An additional objective of the program is to reduce effort on the area's wild stocks and insure that stocking does not negatively impact wild stock genetics or other fisheries. All stocking is conducted in accordance with guidelines set forth in the Statewide Stocking Plan for Recreational Fisheries (ADF&G *Unpublished*).

<sup>a</sup> Catch estimates available beginning in 1990.

## **Recent Board of Fisheries Actions**

BOF action taken in 1998 specific to stocked lakes allows the use of bait in Willow and Crystal Lakes with a bag and possession limit of five per day and five in possession including only one over 20 inches in length. The seasonal limit of two rainbow trout greater than 20 inches applies to these waters.

## **Current Issues**

Increased stocking levels have not produced parallel increases in participation. Lake stocking research indicates the area's stocking program is making more harvestable fish available than ever before, but anglers are not taking full advantage of these fish. Angler-days of participation at area stocked lakes during 1989 through 1992 are approximately equal to 1997 (Havens et al. 1995, Howe et al. 1998). However, given that bag limits were recently reduced on lakes containing wild stocks, it is likely that we will see a substantial increase in use at the area's stocked lakes.

Why has increased stocking not produced proportionate increases in participation? Has the current level of stocking exceeded demand for stocked lake fishing? Are anglers unaware of stocked lake fishing opportunities? Is participation hindered because of poor access, or lack of support facilities at many stocked lakes? Does the SWHS adequately reflect year-round participation of anglers fishing Matanuska-Susitna Valley stocked lakes? Finding answers and solutions to these issues will be essential if stocking in the NCIMA is to function in a cost-effective manner.

## **Ongoing Research and Management Activities**

Landlocked lake research in 1999 continued the evaluation of current stocked lakes for abundance and size and age composition of stocked fish, plus the evaluation of new lakes for possible stocking. Data collected from sampling are used to evaluate stocking plans and update the Matanuska-Susitna Valley Lakes fishing forecast.

A hybrid salmon, a combination of pink and chinook, is being developed for stocked lakes. Hybrid salmon are sterile, allowing fish to be stocked in barriered lakes and remain in the harvestable population longer by not becoming sexually mature and dying at age 3. Hybrid salmon are scheduled to be stocked and evaluated in three lakes during 2000.

## **Recommended Research and Management Activities**

Current levels of stocking within the NCIMA should not increase significantly during the next several years. With increased development in the Matanuska Susitna Valley, additional barren landlocked lakes should be stocked as legal access becomes available. Substantial effort should be directed toward increasing angler participation at stocked lakes by improving the public's awareness of available fishing opportunities. Annual updating of the area's stocked lakes brochure and expanded distribution of this popular pamphlet may help. An additional objective of the program should be to improve and maintain public access, parking, and signing at stocked lakes.

All stocked lakes should continue to be evaluated on a rotational basis. When coupled with public input, these data provide the basis for modifying stocking strategies and providing fishing information to the public.

Assessment of the cost effectiveness of various stocking strategies through use of harvest and effort estimates made available in the SWHS should be continued.

Updating stocking history and harvest numbers is an ongoing process. Additionally, public handouts need to be constructed for more lakes that have public access and support recreational fishing opportunities.

## **RAINBOW TROUT FISHERIES**

### **Background and Historical Perspective**

NCIMA rainbow trout harvests have ranged from 20,000 to 75,000 fish and averaged 43,055 fish during the years 1977 through 1997 (Mills 1979-1994, Howe et al. 1995-1998) (Table 46). This harvest accounts for 38% and 28% of the average harvest within Region II and the state, respectively. Rainbow trout harvested from the Knik Arm Management Unit during this time period accounted for 69% of the total NCIMA harvest. A large percentage of this is a result of the stocked lake program. The Westside Susitna and the Eastside Susitna Management units have accounted for 16% and 14% of the NCIMA harvest, respectively, with the West Cook Inlet Management Unit accounting for the remainder. Several lake and riverine populations of rainbow trout in the Westside Susitna Management Unit have been severely impacted by northern pike predation (Rutz 1998). Since 1990 the SWHS has estimated the catch of rainbow trout. From 1993-1997 the average catch in the NCIMA was 114,671 (Mills 1994, Howe et al. 1995-1998) (Table 46). The Knik Management Unit dominates the catch (57%).

The Board of Fisheries attempted for several years to accommodate a wide array of individual requests for regulatory reform to provide for conservative rainbow trout management. In 1984 they determined that a comprehensive trout policy was needed. During 1985 through 1986, a 13-member citizen planning team working with the department and the angling community developed a draft management policy. During the fall of 1986, the Board of Fisheries officially adopted this plan as a management policy for Cook Inlet and Copper River rainbow trout. The policy provides a systematic approach for selecting fishery regulations as well as a process for rational identification of waters for special management (ADF&G 1986). The Board of Fisheries used the policy from 1986-1996 to implement regulations for rainbow trout within the NCIMA (Engel and Vincent-Lang 1992). In November 1996 the BOF adopted the Criteria for Establishing Special Management for Trout to replace the Cook Inlet and Copper River Rainbow/Steelhead Trout Management Policy for use in instituting regulations.

Even before the policy was developed, the management of Susitna River trout was becoming conservative. Bag and possession limits, for example, were 10 rainbow trout prior to 1982. Beginning in 1982 the bag and possession limits dropped to five rainbow trout of which only two could be 20 inches or more in length. In 1983 the limit was further reduced to allow just one fish 20 inches or more in length. Starting in 1987 and continuing to the present, all streams within the Susitna River drainage have been regulated according to the conservative yield concept of the rainbow trout plan. This management concept strives to maintain historical size and age compositions and abundance levels for wild trout. Bag and possession limits under this concept are two trout, of which only one may be 20 inches or more in length. This management strategy also requires the use of unbaited artificial lures in all flowing waters from September 1 through May 15 to enhance survival of released fish at the time when trout are often a targeted species. During 1997 all eastside Susitna River tributaries were restricted to a single-hook artificial lure

upstream of the Parks Highway. This regulatory scheme attempts to allow a modest portion of the annual trout production to be removed from most populations while the rest are recycled.

The majority of Cook Inlet rainbow trout fisheries are additionally managed under a seasonal limit of two rainbow trout over 20 inches. To assure compliance with this regulation, anglers must, immediately upon harvesting a trout over 20 inches, record that harvest on the back of their license or on a harvest record.

A major portion of the Eastside Susitna Management Unit has been managed for trophy-size trout (trout over 20 inches) since 1987. This fishery encompasses all drainages of the Susitna River from the junction of the Susitna and Talkeetna rivers upstream to Devil's Canyon. Under this strategy, only one trout 20 inches or more in length is allowed daily with a two trout over 20 inches seasonal limit. Small trout must be released immediately. An unbaited, single-hook lure requirement complements this strategy.

The Talachulitna River became Alaska's first catch-and-release trout fishery in 1977. Beginning in 1987 catch-and-release strategies were initiated in most of the Lake Creek drainage, much of the Deshka River, and the Fish Creek drainage located within the Talkeetna River drainage. In 1993 catch-and-release regulations were established for the North Fork of the Kashwitna River and in 1996 Willow and Montana creeks joined the growing list of catch-and-release streams. Unbaited, single-hook lures are mandatory in all catch-and-release waters. Catch-and-release strategies were adopted to perpetuate quality fishing rather than protect or rebuild depressed stocks (Engel and Vincent-Lang 1992).

Stocked landlocked lakes fall under the maximum sustained yield management concept. Bag and possession limits under this management concept are five trout. Although stocked lakes are primarily managed for put-and-take fisheries, three stocked lakes have been established for catch-and-release fishing. These three lakes require using unbaited artificial lures and are closed November 1 to April 30.

Wild trout are not supplemented with hatchery trout in the Susitna River drainage. Public testimony during the development of the rainbow trout plan suggested little interest in the use of hatchery fish to augment wild stocks. In fact, many participants in the planning process expressed strong opposition to any hatchery assistance for wild Susitna River trout.

A description of the Susitna River drainage as well as a discussion of access routes within the area have previously been presented in overviews pertaining to Susitna River chinook salmon fisheries.

According to the SWHS, the harvest of Susitna River (Eastside and Westside Susitna Management Units) rainbow trout has averaged 5,235 fish during the period 1993 through 1997. Approximately 60% of the trout harvest from the Susitna River drainage has been from Eastside Susitna Management Unit tributaries during this time (Appendices A47 and A49).

The Deshka River and Lake Creek generally provide the largest harvests among Westside Susitna Management Unit fisheries while the Talachulitna River generally produces the largest catches (Appendix A49 and A50). The Talkeetna River drainage maintains the largest harvest of rainbow trout from the Eastside Susitna Management Unit (Appendix A47). Willow and Montana creeks produced the largest harvests until 1997, when they became catch-and-release streams.

Studies were conducted on rainbow trout stocks of the Deshka River, Lake Creek and Talachulitna River in 1989 (Bradley 1990 and 1991), the Kashwitna River in 1991, Peters Creek in 1992 (Rutz 1992 and 1993) and the North Fork Kashwitna in 1996. Assessment of migration and the age and length characteristics of these stocks were the primary focus of these investigations. Onsite creel surveys were also conducted at Lake Creek during 1988 and 1989 (Vincent-Lang and Hepler 1989). There were significant differences in age composition and mean length-at-age among Susitna River tributaries sampled during 1989-1992 (Rutz 1992 and 1993). Rainbow trout tagged during 1991 and 1992 indicated low numbers of trout over 510 mm in length, the size limit for trophy trout defined in the Criteria for Establishing Special Management for Trout. This lack of adequately-sized fish, combined with the relatively slow growth rate of Susitna River basin trout in comparison to other Alaskan waters containing trophy trout, suggests that these Susitna River rainbow trout stocks may not be viable candidates for management as trophy fisheries (Rutz 1992).

### **Recent Fishery Performance**

A harvest of 991 rainbow trout in 1998 was the lowest on record for the Eastside Susitna management unit and represents approximately 33% of the 1993-1997 mean harvest for this stock. The Westside Susitna management unit harvest of 1,149 fish represents 54% of the 1993-1997 mean (Table 47). Beginning in 1989 a trend of reduced harvests for Susitna River rainbow trout is evident. This trend is not totally understood but the increasingly conservative regulations that govern major rainbow trout populations within the drainage, as well as a growing desire among anglers to release the majority of their trout catch, are thought to be largely responsible.

The 1998 catch for the Eastside Susitna Management Unit was 26,649 fish, above the 1993 through 1997 average of 22,538 fish (Appendix A48). The 1998 Westside Susitna Management Unit catch was 20,684, below the 1993-1997 average of 26,238 fish (Appendix A50). In all years, less than 10% of the total rainbow trout catch in Eastside and Westside management units is harvested (Tables 13 and 14).

During 1997, Willow and Montana creeks, previously the largest producers of rainbow trout harvest from the eastside Susitna River drainages, became no-retention fisheries. This accounted for a large portion of the drop in harvest for the Eastside Susitna Management Unit from previous years (Appendices A47 and A48) (Howe et al. 1998). The catches for these two fisheries during 1997 and 1998 were above all previous years (except 1996 for Willow Creek) indicating that the no-retention restrictions may be increasing the number of rainbow trout available to anglers.

During 1998 an estimated 326 rainbow trout were harvested in Lake Creek, a Westside Susitna Management Unit fishery, from a catch of 7,376 fish (Appendices A49 and A50). The Deshka River, also a Westside Susitna tributary, yielded a rainbow trout harvest and catch of 218 and 1,647 fish, respectively. The Talachulitna River drainage, which is a catch-and-release fishery, produced a catch of 4,651 rainbow trout. In 1998 the total rainbow trout catch in Susitna River fisheries was approximately equal to the 1993-1997 average.

The vast majority of the rainbow trout harvest in the Knik Arm Unit resulted from stocked lake fisheries (Appendices A45 and A46). These fisheries have been discussed previously in the Stocked Lake Fisheries section of this report.

## **Management Objectives**

Management of Susitna basin rainbow trout through 1996 followed the guidelines set forth in the Cook Inlet and Copper River Basin Rainbow/Steelhead Trout Management Policy. Current management follows criteria stated in the Criteria for Establishing Special Management for Trout as adopted by the BOF in 1996.

## **Recent Board of Fisheries Actions (Including Other Resident Species)**

During the October 1998 BOF meeting the following regulations pertaining to resident fish were adopted:

### Board Actions Concerning Rainbow Trout

1. Willow Creek went from no retention of rainbow trout to allowing the retention of one rainbow trout under 16 inches in length per day and in possession upstream of the Parks Highway bridge. The single-hook, unbaited, artificial lure provision for this area remains in effect. Downstream of the Parks Highway bridge rainbow trout may still not be possessed or retained.
2. Anglers will be allowed to retain rainbow trout and use bait when fishing on the Willow Creek drainage lakes. The bag and possession limit in Shirley, Long, and Rainbow lakes is two per day and two in possession with only one over 20 inches in length. The bag and possession limit in Willow and Crystal lakes, which are stocked annually, is five per day and five in possession with only one over 20 inches in length. The seasonal limit of two rainbow trout greater than 20 inches applies to these and all other Cook Inlet waters.
3. Anglers will not be allowed to harvest rainbow trout from Canyon Creek (Skwentna River drainage). Additionally, only single-hook, unbaited, artificial lures may be used in Canyon Creek year-round.
4. Anglers will not be allowed to retain rainbow trout in flowing waters of West Cook Inlet and the Susitna River drainage from April 15 to June 14. This regulation applies to all flowing waters in these areas, including Willow Creek. This regulation provides for catch-and-release fishing for rainbow trout during this time period.

### Board Actions Concerning Miscellaneous Resident Species

1. A Dolly Varden size restriction was adopted by the BOF for the NCI and Anchorage areas. The regulation now allows for the retention of only one Dolly Varden greater than 12 inches in length to be retained per day. The bag limit remains five fish per day, with five in possession for all NCI and Anchorage area waters. This regulation does not apply to lakes that are stocked by the department with Dolly Varden char.
2. On Big Lake, Arctic char bag and possession limits were lowered and a minimum size limit was established. The bag and possession limit changed in Big Lake from two per day, two in possession to one per day, one in possession with a minimum length requirement of 20 inches. Also, a special provision was established that requires the use of unbaited, single-hook, artificial lures from November 1 through April 30.

The next BOF meeting addressing resident finfish is scheduled for 2001.

## **Current Issues**

Issues concerning NCIMA wild rainbow trout include the need for evaluation of clearwater streams and tributaries in the greater Mat-Su urban area. Rainbow trout harvests have declined in recent years while pressure from a growing urban population continues to increase. It is essential to understand the population dynamics and migratory movements of rainbow trout within these systems to effectively manage this resource. Little information is available regarding the resident fish populations in most of these systems.

## **Ongoing Research and Management Activities**

Catch and harvest trends for rainbow trout are measured by the SWHS.

Presently there are no structured research projects involving rainbow trout underway; however, rainbow trout tagged in 1996-1998 are being recovered by anglers throughout the drainage. This information will help us understand dispersal patterns in the Susitna River drainage.

## **Recommended Research and Management Activities (Including Other Resident Species)**

Abundance, age and length assessment of primary rainbow trout fisheries including, but not limited to, the Talachulitna River, Montana Creek, Clear Creek, and the North Fork Kashwitna River, should be conducted.

Abundance estimation and age composition research of rainbow trout in the Willow Creek drainage should continue on a 3- to 5-year cycle to determine the effects of current regulations. The findings of the 1997 and 1998 studies (Bartlett and Hansen *In prep*) will be compared with findings from the next research cycle to evaluate the effect of the current regulations.

The tag recovery program should remain active to determine rainbow trout dispersal patterns within the eastside Susitna River drainages. Spawning populations of eastside Susitna River drainage rainbow trout should be considered for additional research and protection.

A list of proposed studies to be conducted on resident fish populations should be developed. Available information for most resident fish species is limited to findings of the SWHS.

An evaluation of Arctic char in Big Lake should be conducted. Harvest trends for Arctic char in Big Lake suggest a decline in abundance and little information on the species in Big Lake is available to area managers.

The SWHS catch and harvest estimates for Arctic grayling and Dolly Varden/Arctic char suggest harvest in excess of sustainable yield. Bag and possession limits for both species should be reduced areawide. Information regarding Arctic grayling and Dolly Varden/Arctic char stock status should be collected during all resident fish projects.

The department should continue to participate in land and water use planning.

## **NORTHERN PIKE FISHERIES**

### **Background and Historical Perspective**

Northern pike are not indigenous to the NCIMA. They were illegally introduced into this area during the early 1950s. Since then, northern pike have been reported in more than 100 lakes and more than a dozen tributaries of the Susitna River (Appendix G). Prior to 1992 several of these lakes consistently produced northern pike in the trophy class range (greater than 42.5 inches or

1,080 mm) and it was common to find fish weighing up to 20 lb and fish occasionally weighing over 30 lb.

In 1977 when the SWHS was initiated the harvest of northern pike in the NCIMA numbered less than 200 fish. At that time NCIMA accounted for only 1% of the statewide harvest of northern pike (Mills 1979) (Table 48). Northern pike harvests slowly increased through 1983 when the harvest totaled less than 1,000 fish. Since 1984 the harvest of northern pike has greatly increased. The average harvest during 1984-1987 was 1,916 while 1988-1991 averaged 3,946 and 1992-1996 averaged 4,828 fish (Figure 21). As northern pike spread throughout the NCIMA anglers have become more interested in them as a recreational fish, indicated by increasing harvest and catch estimates since 1991 (Table 48). With the exception of 1994 and 1995, all years since 1990 recorded harvests over 5,000 fish.

### **Recent Fishery Performance**

The NCIMA estimated harvest of northern pike during the 1998 season was 12,410 fish, over twice the 1993-1997 mean and the largest harvest on record. The Westside Susitna Management Unit accounted for about 47% of this harvest, the Knik Management Unit 50%, with the remainder from the Eastside Susitna and WCI units (Table 48, Appendices A54-A56). The SWHS's first documented northern pike harvest from the Eastside Susitna and WCI management units came in 1997; previously, other than public testimony, no information was available regarding northern pike harvest from these areas. The majority of the increase during the 1998 season is represented by the harvest in the Knik Management Unit. In 1998 this management unit more than doubled its 1996 and 1997 harvests. During 1997, for the first time, the NCIMA pike harvest surpassed the Arctic-Yukon-Kuskokwim (AYK) area which was previously the major producer of pike. This trend continued in 1998.

The NCIMA estimated catch of northern pike during 1998 was 47,297 fish. The Westside Susitna Management Unit reported 62% of this catch with the Knik Management Unit reporting 36%. During 1998 harvest and catch doubled the 1993-1997 mean in both these management units (Appendices A54-A56). The NCIMA catch of northern pike has yet to surpass the AYK catch; however, the gap is narrowing.

### **Management Objectives**

The management objective for this fishery is to maximize harvest opportunity.

In an effort to provide anglers the opportunity to catch large fish, the BOF adopted a slot limit regulation for Alexander and Trapper lakes. The objective is to remove small fish (less than 22 inches) from the population while allowing some fish to reach a large size (greater than 30 inches). Providing this opportunity will lead to an increase in angler effort resulting in an increase in harvest of unprotected pike less than 22 inches. It is thought that pike in the 22-30 inch protected range will eat a large quantity of small pike thus reducing the population overall

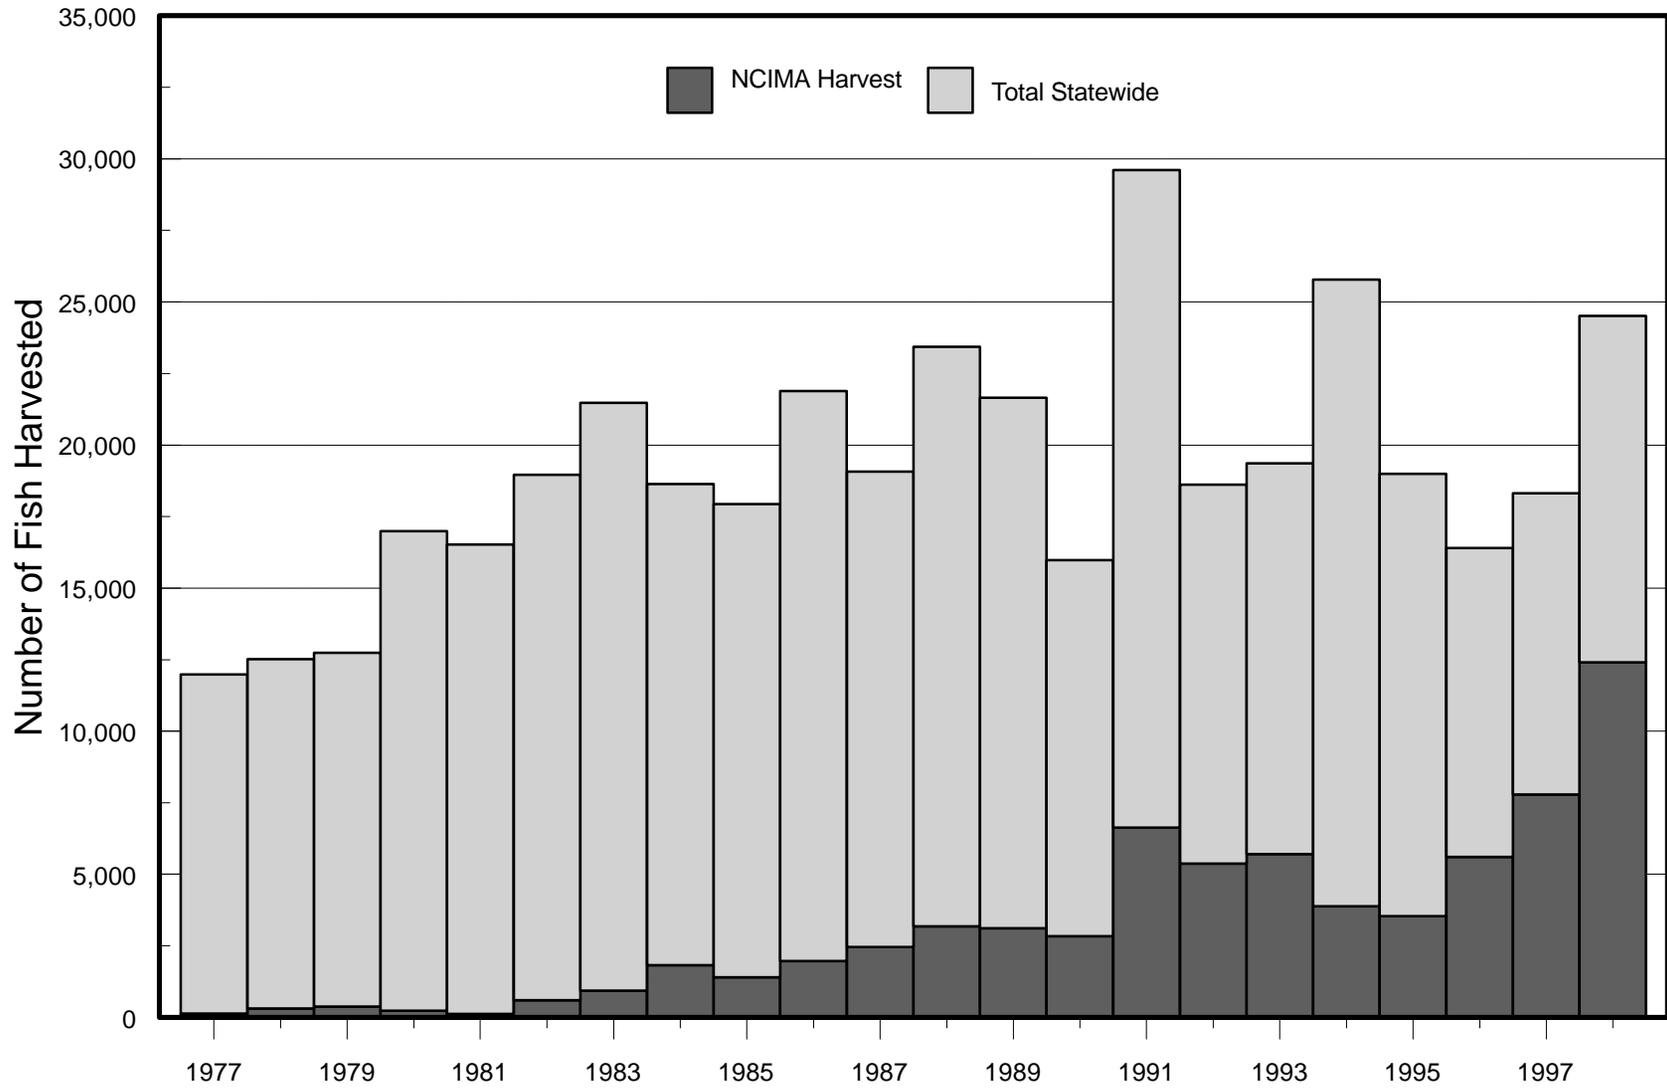

**Table 48.-Northern Cook Inlet Management Area recreational catch and harvest of northern pike by management unit as estimated by SWHS, 1977-1998.**

Year	Northern Cook Inlet Management Area <sup>a</sup>										Region II		Statewide

<sup>a</sup> No reported catch or harvest from Eastside Susitna or West Cook Inlet management units until 1993.

<sup>b</sup> Harvest of northern pike prior to 1985 may have been included in other fish species category.

<sup>c</sup> Catch estimates available beginning in 1990.

**Figure 21.-Estimated northern pike harvest from Northern Cook Inlet Management Area and statewide, 1977-1998.**

and providing large fish for harvest. These fisheries will be closely monitored to evaluate the effectiveness of the slot limit regulation.

### **Recent Board of Fisheries Actions**

During the 1998 BOF meeting the following regulations concerning northern pike were adopted:

1. Anglers will be allowed to use bow and arrow for the taking of northern pike in NCI waters. It is required that the arrow be attached to the bow with a line and that the arrow contains a barbed tip.
2. Anglers will no longer be restricted to using 3/4-inch single hooks when fishing through the ice on select Northern Cook Inlet lakes where five lines are allowed. Standard ice-fishing gear under the methods and means section of the regulations book will apply to all lakes.
3. A slot limit was established for northern pike in Alexander and Trapper lakes. Anglers will still be able to retain an unlimited number of pike less than 22 inches in length (a 22-inch pike weighs between 3 and 4 pounds). Northern pike between 22 inches and 30 inches in length may not be retained. The bag and possession limit for pike 30 inches or greater in length will be one per day and one in possession. Additionally, the action taken for Alexander and Trapper lakes reduced the number of lines allowed when fishing through the ice for northern pike from 5 lines to 2 lines, and prohibits the use of spears and bow and arrows for taking northern pike.

The next BOF meeting addressing resident species will be in 2001.

### **Current Issues**

Northern pike are well known for their voracious appetites. Other state agencies rely on stocking northern pike to control populations of undesirable species. In Alaska there is a growing concern by commercial fishermen, recreational anglers and fishery managers that northern pike predation on chinook, coho and sockeye salmon, as well as rainbow trout, may adversely impact these stocks during a period in which they are subject to increasing harvest. Many people favor eradicating northern pike to reduce their impact on other resident fish species. Studies have shown that in several Susitna Basin streams there is an overlap between salmonid and northern pike habitat. Juvenile salmon stocks (primarily coho salmon) can be quickly eliminated by northern pike predation (Rutz 1996). In addition, we attribute the decimation of rainbow trout and grayling stocks within some of these systems to northern pike predation. Northern pike prefer soft rayed fish as a food source (Eklov and Garrin 1989). This was evident with northern pike sampled in the Deshka River, Hewitt, Moose, Indian and Witso creeks where sockeye salmon, rainbow trout and coho salmon juveniles were preferred over stickleback (Rutz 1996). Once preferred food items have been depleted, northern pike quickly adapt to alternative sources such as insects (Chapman et al. 1979, Rutz 1996 and 1998).

Although there are concerns regarding the impact on salmon and rainbow trout stocks as a result of northern pike predation, many recreational anglers welcome a healthy pike population as they provide increased recreational opportunities during the entire year. Throughout literature there is a history of overexploitation of northern pike due to increasing recreational harvests. Even though the northern pike sport fishery in Upper Cook Inlet is fairly new, the performance of this fishery already suggests overexploitation as evidenced by the lack of large fish.

The following is a list of systems and lakes where native fish populations are thought to have been decimated by northern pike predation. Also included is a list of potential future problem areas.

### Susitna Drainage

#### Severely Depressed Systems

1. Fish Creek (Nancy Lake Canoe System). Probable reduction of sockeye and coho salmon along with more than 30 lake populations and one stream population of rainbow trout. Burbot and whitefish populations were probably also severely impacted.
2. Fish Creek (Kroto Slough). Probable reduction of sockeye and coho salmon, along with seven or eight lake populations and one stream population of rainbow trout and Arctic grayling. Burbot and whitefish populations were probably also severely impacted.
3. Fish Lake Creek (Yentna River). Probable reduction of sockeye and coho salmon, along with five lake populations and one stream population of rainbow trout and Arctic grayling. Burbot and whitefish populations were probably also severely impacted.
4. Donkey Lake (Yentna River). Probable reduction of sockeye and coho salmon, along with lake and stream populations of rainbow trout. Burbot and whitefish populations were also probably severely impacted.
5. Unnamed Creek Kutna Slough (Yentna River). Probable reduction of sockeye salmon and coho salmon, along with a lake population of rainbow trout. Burbot and whitefish populations were probably also severely impacted.
6. Alexander Lake and all inlet streams. Probable reduction of sockeye salmon, coho salmon and chinook salmon, along with lake and stream populations of rainbow trout and Arctic grayling. Burbot and whitefish populations were probably also severely impacted.

#### Moderately Depressed

1. Indian Creek (Yentna River drainage). Probable reduction of the coho salmon and chinook salmon population due to pike predation. Very few sockeye salmon are present in this system. Rainbow trout population may be less than half its pre-pike abundance.
2. Moose Creek (Yentna River drainage). Probable reduction of the coho salmon and chinook salmon populations due to pike predation. Very few sockeye salmon are present in this system. Rainbow trout population may be less than half its pre-pike abundance.
3. Bottle Creek (Yentna River drainage). Probable reduction of the coho salmon population due to pike predation. Very few sockeye or chinook salmon are present in this system. Rainbow trout population may be less than half its pre-pike abundance.
4. Whitso Creek (Susitna River). Probable reduction of the coho salmon population due to pike predation. Very few sockeye or chinook salmon are present in this system. Rainbow trout population may be less than half its pre-pike abundance.
5. Hewitt Creek. This system has two well established lake populations and a well established creek population of northern pike. Much of this system provides excellent pike rearing and spawning habitat. Coho salmon populations are probably heavily impacted by northern pike predation. Sockeye salmon are pelagic feeders in the two lakes, so they seldom come in

contact with northern pike during their juvenile rearing period. However, as sockeye smolt migrate out of the lake they are vulnerable to pike predation in a 10-mile stretch of Hewitt Creek for a short period. Because of the large numbers of outmigrating smolt, and given they are only vulnerable to predation for a very short period, we estimate that losses are low. The rainbow trout have nearly disappeared from this system since pike arrived. Little is known about the status of the burbot or whitefish in this system.

6. Deshka River. Losses of sockeye salmon production to pike predation are probably very high for the Deshka River, as most of the production for this species is associated with the shallow water connecting lakes which now contain well established pike populations. Northern pike predation is probably responsible for loss of coho salmon production in this system, with most of this loss attributed to juvenile coho salmon that rear in side sloughs. Pike predation probably has very little effect on the chinook salmon population in the mainstem Deshka River, but tributaries such as Trappers, Noname and Chijuk creeks may have much higher losses due to stream morphology. Rainbow trout and Arctic grayling populations in some of the connecting lakes have been severely reduced since the arrival of the northern pike, while stream populations are probably only moderately affected. We do not know what effect pike predation has had on the burbot population; however, we know that some lake populations of burbot have been decimated in shallow lake systems with well established pike populations
7. Alexander Creek. Losses are probably heavy for sockeye salmon as most of the production for this species is associated with the shallow water connecting lakes (Alexander, Trail, and Sucker lakes) which contain well established pike populations. Coho populations are not affected to this degree. Much of the loss is to juvenile coho salmon that rear in the hundreds of side channels and sloughs. Again, pike predation probably has very little effect on the chinook salmon population in mainstem Alexander Creek, but tributaries such as Upper Sucker Creek and all streams above Alexander Lake probably suffered much higher losses as most of the system's pike population is found in these waters. Rainbow trout and Arctic grayling populations in the connecting lakes have also been severely impacted, while stream populations are probably only moderately affected. We do not know what effect pike predation has had on the burbot population in this system.

#### Lightly Depressed Systems

1. Shell Lake. Very little pike habitat is present in this system and loss of salmonids due to pike predation is expected to be very small.
2. Lake Creek (Chelatna Lake). Chelatna Lake, along with one additional small lake system, contains the majority of Lake Creek's pike population. Very little pike habitat is present in this system and loss of salmonids due to pike predation is expected to be very small.

#### Potential Problems

1. Mama Bear and Papa Bear lakes (Talkeetna). Should northern pike become established in this system, it is probable that salmonid populations will be severely impacted as much of this system is comprised of ideal spawning and rearing habitat for pike.
2. Caswell Creek. This system supports a fair amount of pike habitat, including several shallow water lakes. Should pike become well established in this system chinook and coho salmon numbers could be significantly reduced.

3. Rabideux Creek. This system supports a fair amount of pike habitat. Should pike become well established they may reduce chinook and coho salmon numbers.
4. Fifteen to twenty small shallow lake systems (Susitna River drainage). Slow moving tributaries which may be comprised of one or more shallow lakes or ponds and support unknown populations of salmonids may have, or will be, seriously impacted by northern pike predation.

#### West Cook Inlet

##### Potential Problems

1. Three Mile River (Beluga). Given this system's ideal pike habitat it is probable that salmonid populations, specifically sockeye salmon, will be severely impacted by a growing pike population.

#### Knik Arm Drainages

##### Potential Problems

1. Jim Creek. This is a fairly large system that supports ideal pike habitat for both spawning and rearing. It is probable that the large coho and sockeye salmon and Dolly Varden populations will be severely impacted or completely decimated by pike predation should pike ever become established. In recent years there have been a few unconfirmed northern pike sightings.
2. Cottonwood Creek. Given this system's ideal pike habitat it is probable that coho and sockeye salmon populations along with rainbow trout populations will be severely impacted by pike predation should they become established. There have been several documented northern pike sightings in one of the connecting lakes to this system.
3. Big Lake System (Fish Creek/Meadow Lakes). Only small portions of Big Lake support ideal pike habitat; therefore, existing salmonid populations from Big Lake are not expected to be severely impacted by pike habitation. However, the Meadow Creek drainage which flows into Big Lake does support a great deal of pike habitat and salmonid populations from this system may be severely impacted should pike ever become well established. Northern pike have been documented in one lake of this system and unconfirmed sightings were reported on two others.
4. Little Susitna River. This system supports little northern pike habitat indicating minimal impact to salmonid populations resulting from northern pike predation. Some of the smaller lake systems draining into the Little Susitna River may be severely impacted, but these small lake systems collectively account for a small portion of the overall salmon production for this system.

Overall, northern pike have been destructive to the salmonid resource of the Susitna River drainage. To date there are more than 90 lakes and nearly 50 river systems in the Mat-Su Valley and Anchorage areas that are thought to be inhabited by pike. Though pike have taken their toll on these waters, it is believed that the pike populations throughout the Susitna River drainage may be reaching a point of stability. If pike begin to colonize other systems such as Jim Creek, Big Lake and Cottonwood Creek, we can expect to see large losses in salmonid production.

In shallow lake systems pike have wiped out existing native fish species. Recolonization of native species is highly unlikely. With no species of fish left in these lakes other than pike it may be wise to manage these populations more conservatively, whereby allowing fishermen the opportunity to harvest larger sized pike. However, in flowing waters, pike continue to prey on salmonid populations and current liberal management strategies should remain in effect.

### **Ongoing Research and Management Activities**

During 1997 an investigation was conducted to determine the presence or absence and food habits of spawning northern pike in three sloughs of the Deshka River. Salmonids were documented within their stomach contents. This project should be conducted on an annual basis.

Age, sex and size information were collected from Alexander Lake northern pike during May to measure the effect of the slot limit regulation adopted prior to the 1999 season. Unfortunately the pike population had already spawned by the time the netting was done so the information was not comparable to other years. Upon completion of spawning the larger pike disperse throughout the lake causing the size composition of the population to be biased toward smaller fish.

### **Recommended Research and Management Activities**

1. Northern pike distribution and dietary preference should continue to be monitored in selected Susitna drainage waters with major emphasis on the Deshka River.
2. Northern pike in the Deshka River drainage should be radio tagged and monitored until the batteries expire.
3. Age, sex and size information should be collected from Alexander lake northern pike in the spring of 2000 to determine the effect of the slot limit regulation adopted prior to the 1999 season.

### **FISHERIES ACCESS IMPROVEMENTS**

To provide better angler access and increase fishing opportunities, access improvements should be made annually. Proposed projects are listed in Table 49. Efforts should be directed to a few stocked lakes each year (Table 50). Current projects include:

1. Signage identifying public access on an as-needed basis.
2. Loon Lake access trail was relocated to contain it within a nearby section line easement. A parking area was also developed at the trailhead with help from the Mat-Su Trails Council. Further hardening of the trail and parking area with more gravel and providing signage are ongoing projects.
3. Honeybee and Lynne lakes access road easement was applied for and surveyed. Some realignment will be necessary for approval and recording. Negotiations to purchase portions of the easement from private property owners is ongoing.
4. Christensen Lake boat launch facility enhancement is a cooperative effort with the Mat-Su Borough.

**Table 49.-Proposed access projects for NCIMA in 1999.**

	Location	Project	Estimated Cost	Funding Year
<b>Non-Boating Projects<sup>a</sup></b>				
1	Region II Small Access Maintenance (non-boating)	Site maintenance contracts, signage	\$162,600	00
2	Eklutna Tailrace	Expand parking and construct vault toilets.	\$100,000	NF <sup>c</sup>
3	Little Susitna River Public Use Facility	Trail improvements & bank stabilization.	\$100,000	00
4	Caswell Creek	Construct access trail & bank stabilization.	\$0	SAM <sup>d</sup>
5	Honeybee and Lynne lakes	Purchase easement.	\$0	SAM
6	Willow Creek SRA Sanitation	Move vault toilet from eroding river.	\$40,000	01
7	Finger Lake	ADA dock construction.	\$20,000	01
8	Cope Property	Purchase property & upgrade access.	\$50,000	NF
TOTAL			\$472,600	
<b>Boating Projects<sup>a</sup></b>				
1	Region II Small Access Maintenance (Boating)		\$179,600	00
2	Christiansen Lake	Enhance boat launch facility as a cooperative effort with the Mat-Su Borough.	\$75,000	99
3	Little Susitna River within the Susitna Flats State Game Refuge (Active)	Harden camp sites. Stream bank stabilization and repair damage caused by boating activity, construct permanent boat tie ups.	\$60,000	99
4	Susitna Landing	Construct handicapped access dock and permanent boat tie-ups. Stream bank stabilization.	\$200,000	99
5	Little Susitna River Public Use Facility	Funds RSA to State Parks to operate LSPUF.	\$90,300 <sup>b</sup>	00
6	Finger Lake Boat Ramp	Boat ramp upgrade.	\$120,000	00
7	Remote Site Sanitation	Pit toilets at Alexander and Lake Creeks.	\$100,000	NF
8	Knik River-Glenn Highway	Construct boat launch.	\$100,000	NF
9	Nancy Lake SRA	Boat ramp upgrade and install new ADA fishing dock.	\$200,000	01
10	Chulitna River	Construct new boat ramp with DNR Parks.	\$300,000	NF
TOTAL			\$1,424,900	

<sup>a</sup> Completed access projects are listed in Appendix I.

<sup>b</sup> Increased RSA includes a 6 month Parks tech position and a one-time boat purchase.

<sup>c</sup> NF = Not Funded.

<sup>d</sup> SAM = Small Access Maintenance Project.

<sup>a</sup> ROW = right of way

S/L = section line easement (feet wide)

PUA = dedicated (or reserved) public use area (parcel platted for public recreation)

PUE = dedicated public use easement (feet wide)

SRA = state recreation area (parcel managed by State Parks)

MSB = Matanuska-Susitna Borough

5. Caswell Creek access currently consists of a rutted and steep foot trail linking the parking area to the fishery. Plans to incorporate a timbered stairway to enhance access are underway.
6. Twin Island Lake access can only be (legally) achieved over swampy state-owned land. All the higher ground between Pt. MacKenzie Road and the lake is privately owned. The Mat-Su Borough, owner of one of these lots, is being solicited for the sale of an easement crossing its property.
7. Little Susitna Public Use Facility incorporates a system of trails providing access to bank anglers. In an effort to reach prime fishing water, anglers have pushed beyond the structured trail system causing upland and stream bank erosion. Alaska Department of Natural Resources, Division of Parks and Outdoor Recreation (ADNR, DPOR) has provided a plan to harden or elevate these trails. This project will provide handicapped access to prime fishing holes while protecting the environment.
8. Little Susitna River, within the Susitna Flats State Game Refuge, receives a high volume of camping activity during the summer which has thus far gone unchecked and resulted in

upland and stream bank degradation. An effort is underway to repair these damaged sites through revegetation and to protect them from further damage by hardening existing camp areas and providing sanitation facilities.

9. Susitna Landing Boat Launch provides limited handicapped access to a major river drainage. Constructing amenities that conform with ADA standards will provide equal access to this vast watershed. Plans to construct a handicapped access dock and trail system along with stream bank stabilization and permanent boat tie-ups are underway.

There are several State Recreation Sites along the road system of the NCIMA. State Recreation Sites are on state lands that are managed by the Department of Natural Resources, Division of Parks and Outdoor Recreation. These sites all allow day use with the majority providing camping opportunities. Most of these sites require payment of a fee for facility use. In general, camping opportunities adjacent to lakes and streams along the road system are limited. At the majority of recreation sites adjacent to lakes and streams, Sport Fish Restoration moneys were used in development of at least parking areas and boat ramps. It is appropriate to use access funds in maintaining and improving these facilities as they often provide outstanding opportunities to people in the pursuit of power boating and recreational fishing activities.

1. Finger Lake. The Finger Lake State Recreational Site is within the core area of the Matanuska-Susitna Borough. The site provides camping, day use, fishing, swimming and other recreational opportunities. The facility is adjacent to urban and residential areas of the borough and is generally full during the open-water period. It also supports significant day use during the winter months, primarily for ice fishing. An ADA-accessible fishing dock is being considered for this site.
2. Nancy Lake. The Nancy Lake State Recreation Site, on the northeast shore of Nancy Lake, has 30 camping sites and is reached from Mile 66.5 on the Parks Highway. The Nancy Lake recreation site is a popular area, especially during the open water season. Nancy Lake is within the Nancy Lake State Recreation Area (SRA) which is one of Alaska's few flat, lake-studded landscapes preserved in its natural state for recreation. Nancy Lake is also one of the larger lakes in the NCIMA and supports a significant amount of power boat activity. A boat ramp is presently in use at the Nancy Lake Recreation Site. However, this ramp is old and needs to be upgraded. A double lane boat ramp needs to be installed. Additionally, the dock associated with this ramp needs to be upgraded and a new fishing dock needs to be installed. Upgrading this facility is not expected to significantly increase power boating and angling; however, it is expected to curtail a significant drop in participation.
3. Bonnie Lake. The Bonnie Lake parking area and boat launch was graded during 1995. Design and construction of a fishing dock was completed during the summer of 1996 as a joint effort between ADNR Division of Parks and Outdoor Recreation, ADF&G, and the Bonnie Lake Property Association. Modifications and repairs were completed to the boat ramp in July 1997. Continued site maintenance will be provided by ADNR, DPOR. The ADF&G will provide pumping of vaulted toilets and finance ADNR, DPOR for facility maintenance.
4. Big Lake South boat launch and parking facility receives a tremendous amount of recreational boating activity throughout the summer. The substantial increase in the use of this facility since its construction has not only left it in a state of disrepair but shown it to be

of inadequate dimension. ADNR, DPOR has not been financially capable of performing the maintenance required to keep this a safe public access to Big Lake. The ADF&G is funding the upgrade of this facility as a cooperative agreement with ADNR, DPOR. Improvements will include expanding the parking area and replacing the concrete boat launching ramp. The anticipated cost for this venture is \$250,000.

5. Willow Creek SRA is a non-boating facility where use levels are expected to exceed capacity. ADNR, DPOR has developed a draft plan to expand an underdeveloped day-use parking area and enhance an interconnected trail system. This action will effectively accommodate overflow parking and expand the bank fishing area while controlling habitat degradation.

## ACKNOWLEDGMENTS

A portion of the content of this report was taken from Larry Engel and Doug Vincent-Lang's 1992 NCIMA report to the Board of Fisheries. Craig Baer made significant contributions to the stocked lakes section and Larry Erie contributed access information. Margaret Leonard prepared this document for publication.

Note: One wild chinook salmon, originally tagged as a coho salmon in the Deshka River, was commercially harvested on June 7 in the Western portion of the Northern District.

## Appendix B12.-Upper Cook Inlet commercial fisheries season summary for 1999.

All harvest numbers in this summary are preliminary harvest figures based on inseason catch reports.

### Regulatory Changes

There were many regulation changes as a result of the Board of Fisheries meeting in February 1999, with significant changes to management plans used to conduct the UCI commercial fishery. Probably the most dramatic and most difficult change to implement was with the abundance-based escapement goal in the Kenai River. Under this management plan the escapement goal and management actions change according to the level of total return to the Kenai River.

<u>Kenai River Total Sockeye Return</u>	<u>Escapement Goal</u>
Less than 2 Million	600,000-850,000
2 Million to 4 Million	750,000-950,000
Over 4 Million	850,000-1,100,000

In addition to changes in the escapement goal there are required 24-hour no-fishing periods on Fridays beginning at 12 noon (“windows”) in the Kenai and East Forelands Sections in returns of over 2 million and additional 24-hour closures if the chinook recreational fishery is restricted. The only other sockeye salmon escapement goal change as a result of the BOF meeting was in the Crescent River where the goal was reduced from a range of 50,000-100,000 to a range of 25,000-50,000 sockeye salmon due to productivity changes within Crescent Lake. There were many other regulation changes including changing the regular fishing period schedule from Monday and Friday periods to Monday and Thursday periods. The only exceptions to this fishing schedule are the set gillnet fisheries conducted under the Big River Sockeye Salmon Management Plan, 5 AAC 21.368 and Northern District King Salmon Management Plan, 5 AAC 21.366. All species of salmon retained from a commercial catch for personal use must now be reported on an ADF&G fish ticket. The use of aircraft “spotter pilots” is not allowed for 1 hour prior to, during, or 1 hour after a fishing period. The early July drift fishery restriction that has occurred by emergency order the last several years is now in regulation to occur between July 9 and July 15. A second late July restriction of the drift fishery was added to occur on or immediately before July 25, making a total of three drift restrictions in regulation. Set gillnet fisheries in Knik Arm conducted under the Fish Creek Sockeye Salmon Management Plan, 5 AAC 21.364, will not take place during the 1999-2001 fishing seasons. In 5 AAC 21.360 Kenai River Sockeye Salmon Management Plan, a change was made to allow the drift gillnet fishery to be managed independent of the set gillnet fishery in the Upper Subdistrict. This change might have an impact during the 24-hour closed periods mentioned above for the set gillnet fishery where the drift gillnet fishery may be open in a portion of the Kenai and Kasilof sections offshore of the set gillnet areas.

### Sockeye Salmon

The preseason forecast for a return to the Kenai River of 1.7 million sockeye salmon initially resulted in an escapement goal target of 600,000 to 850,000. The Upper Cook Inlet harvest of 2.7 million sockeye salmon was 700,000 fish over the preseason forecast (Table 1). Much of this additional harvest is likely attributable to Kasilof River stocks which were much stronger than forecast; however, no return estimate by river system is available at this time. Kenai stocks

are also likely stronger than forecast. Sockeye salmon prices at the beginning of the season were \$.90 to \$1.10 per pound but by the end of the season most processors were paying \$1.30 to \$1.40 per pound, paid retroactively to the beginning of the season. This resulted in an exvessel value for sockeye salmon of \$22.8 million, which was 96% of the total UCI exvessel value for salmon.

The commercial salmon season for most areas of Upper Cook Inlet opens for Monday and Thursday regular periods beginning June 25. The exceptions to this June 25 general opening are set gillnetting in the Kenai, Kasilof and East Forelands sections.

The Kasilof Section, targeting Kasilof River sockeye salmon stocks, opened for regular Monday and Thursday fishing periods on Thursday July 1. One additional fishing period of 15 hours on July 3 was needed in the Kasilof Section prior to the Kenai and East Forelands sections opening for regular periods. The Kenai and East Forelands sections opened as scheduled on Thursday July 8. With a strong Kasilof return, 20 hours of additional fishing time was necessary in the Kasilof Section beginning on July 8, and 13 hours on July 11 to control Kasilof escapements prior to Kenai stocks arriving in any significant numbers. Because the Kenai River return was forecast to be fairly weak, a conservative fishing pattern was established that restricted additional fishing time in the Kasilof Section to within 0.5 mile of the mean high tide mark until July 27. This restriction excludes set gillnets from 0.5 to 1.5 miles from shore. It also eliminates drift gillnets, which lowered the exploitation rate of Kenai sockeye salmon stocks until Kenai run strength could be evaluated. In addition the regular period scheduled for July 26 was closed in the entire Upper Subdistrict to ensure adequate Kenai escapement. Escapements to both the Kenai and Kasilof rivers increased substantially over the July 23-27 period with the Kasilof River escapement rapidly approaching the upper end of the escapement range, while the escapement into the Kenai was projected to be within the 600,000 to 850,000 range. A fairly aggressive fishing pattern was necessary in the Kasilof Section to try to control escapement to the Kasilof River. However, several days of high wind and tides, combined with a great deal of debris in the water, greatly reduced the efficiency of the fishing gear, which contributed to exceeding the Kasilof River escapement goal by over 60,000 sockeye salmon (Table 2). In the Kenai and East Forelands sections additional fishing time was allowed to harvest surplus Kenai sockeye salmon until July 30 when the Kenai total return estimate was approaching 2 million. At that time we were unsure which Kenai total return range was appropriate for management, over or under 2 million. We elected to try and manage for the overlap in the escapement goal ranges and managed for an escapement range of 750,000 to 850,000 sockeye salmon. An escapement within this range would be within the BEG range for over or under 2 million total return levels to the Kenai River. In addition the 24-hour closed periods on Fridays in the Kenai and East Forelands sections were implemented as required. This change late in the season in escapement objectives resulted in fishing only in the Kasilof Section until August 1, when we could project the 750,000 Kenai River sockeye salmon escapement goal. From August 1 to August 5 the Kenai, Kasilof and East Forelands sections were open to maintain the escapement into the Kenai River within the targeted range, with a final escapement of 803,410 sockeye salmon.

Since 1990 the Crescent River on the west side of Cook Inlet has been producing at a lower level than is required to meet escapement goals without severe restrictions to the commercial fishery. In 1999 the BEG for this system was lowered in response to decreased productivity in Crescent Lake. Early season harvests and escapement to this system were good enough that no early season restrictions were implemented to either the drift or set gillnet fisheries in this area. On

July 12 it became apparent that the lower end of the escapement goal was assured and continuous fishing was allowed in the set gillnet fishery in the Western Subdistrict south of Redoubt Point until July 31. This is a very small fishery with few participants and, even with this extended fishing time, the upper end of the escapement goal was exceeded by 20,000 sockeye salmon with a final escapement of 69,590 sockeye salmon.

The commercial fishery targeting Fish Creek stocks in Knik Arm was closed by BOF action for the 1999-2001 seasons. This system has been enhanced since 1976. Even with the commercial fishery in Knik Arm and the personal use dip net fishery in Fish Creek being closed, the final escapement of 26,691 sockeye salmon was well below the 50,000 sockeye salmon BEG. Packers Creek on Kalgin Island has been enhanced since 1973, with both stocking and lake fertilization implemented during some portion of this project. Both stocking and fertilization were terminated in 1998. The 1999 escapement of sockeye salmon into Packers Creek was 25,648, slightly above the upper end of the escapement goal range of 15,000 to 25,000. The 1999 return to Packers Creek was fairly weak, but has allowed a modest harvest in the Kalgin Island Subdistrict and a modest amount for cost recovery by Cook Inlet Aquaculture Association.

### **Chum Salmon**

The 1999 harvest of 178,955 chum salmon was a modest improvement from returns we have seen the last 3 years. The 1999 chum harvest would likely have been higher except for management actions restricting the drift fleet and Northern District fisheries for Yentna sockeye and Northern District coho salmon. Since the flood of 1986 chum salmon production in much of southcentral Alaska has been poor, with recent harvests well below the long-term average harvest of 563,000. The chum salmon return to Chinitna Bay was essentially unexploited as the local set gillnet fishery was inactive due to poor prices and no tendering service from any processor. Fishermen were paid \$.15 to \$.40 per pound for chum salmon, producing an exvessel value of \$250,000 or just 1.1% of the overall fishery value.

### **Pink Salmon**

The 1999 harvest of 16,163 pink salmon is one of the lowest harvests for an odd year in Upper Cook Inlet. As with chum salmon, management actions restricting the drift fleet and Northern District fisheries for Yentna sockeye salmon and Northern District coho salmon are a contributing factor to this poor pink salmon harvest. Pink salmon escapements are not monitored in Upper Cook Inlet; however, it appears that escapements to most river systems were normal for odd year run strengths. Prices paid for pink salmon were \$.03 to \$.10 per pound resulting in an exvessel value for this species of \$6,800.

### **Coho Salmon**

The 1999 coho salmon harvest of 123,587 was about half of the average long-term harvest in Upper Cook Inlet and the lowest harvest since 1973. Average commercial coho salmon harvests by decade since 1950 are 194,000, 262,000, 187,000, 529,000 and 348,000, with an overall average harvest of 313,000. Commercial coho salmon harvests in UCI during the 1980s and early 1990s were much higher than the long-term average due to good coho salmon production and also due to strong sockeye salmon returns to Upper Cook Inlet, resulting in more fishing time in the Central District. Coho salmon harvests since 1997, and especially in 1999, have been reduced due to a number of factors. Most notably wild stock coho salmon harvests statewide have declined by an average of approximately 40% during the last 3 years compared to the average of 1990-1998. In addition, regulations from the BOF since 1996 reducing the fishing

time of the drift fleet in the Central District, and elimination of additional fishing time directed at coho and sockeye salmon surpluses in the Northern District and Kalgin Island subdistricts has lowered the commercial exploitation rate dramatically.

### **Chinook Salmon**

The 1999 harvest of 14,155 chinook salmon was about equal to the recent 10-year average harvest and much improved over the 1998 harvest of 7,997. The 1999 chinook salmon harvest was valued at \$400,000, approximately 1.5% of the total exvessel value. The directed chinook salmon fishery in the Northern District was limited to the first two periods of three scheduled, to aid in rebuilding a number of stocks where escapement levels had been below desired levels in recent years. The resulting catch was 1,827 chinook salmon from the first period and 407 from the second period. Harvest and effort for the second period was much reduced due to strong winds out of Turnagain Arm. Even with this harvest reduction during the second period the harvest is the highest since 1995, and much improved over 1997 when only one period was allowed. The set gillnet fishery harvest in the Kenai, Kasilof and East Forelands sections in 1999 was 9,339 chinook salmon. The sonar count into the Kenai River was 48,000 with an estimated 12,000 fish harvested in the recreational fishery, leaving an escapement of 36,000; slightly above the BEG of 17,800 to 35,700.

**Table 1.-Upper Cook Inlet commercial salmon harvest by species, 1954-1999.**

## **APPENDIX D**

## **Appendix D1.-Emergency orders issued for NCIMA waters during 1991-1999.**

### **Emergency Orders issued in 1991:**

1. E.O. No. 2-KS-2-03-91 reduced bag and possession limits within the Chuitna (Chuit), Theodore, Lewis, and Beluga River drainages to 1 king salmon 16 inches or more in length. Effective from May 25 through July 13, 1991.
2. E.O. No. 2-KS-2-16-91 closed the Lewis and Theodore drainages to king salmon fishing, and additionally closed the Chuit River drainage upstream from the Tyonek Road crossing to king salmon fishing. Effective June 25 through July 13, 1991.
3. E.O. No. 2-KS-2-21-91 superseded E.O. 2-KS-2-16-91 and closed Lewis, Theodore and Chuit rivers in their entirety to king salmon fishing. Effective July 4 through July 13, 1991.
4. E.O. No. 2-KS-2-22-91 opened all waters within one-fourth mile radius of Willow Creek's confluence with the Susitna River to fishing for king salmon. Effective July 6 and July 7, 1991.
5. E.O. No. 2-SS-2-27-91 closed to fishing that portion of the Little Susitna River from the fish counting weir located at River Mile 32.5 downstream for a distance of 1,500 feet. Effective July 27 through September 14, 1991.
6. E.O. No. 2-RS-1-29-91 closed sockeye salmon fishing in all waters north of the latitude of Anchor Point. Effective 7:00 a.m. July 26 through December 31, 1991.
7. E.O. No. 2-RS-2-33-91 opened the Fish Creek personal use dip net fishery. Effective July 30 through August 9, 1991.
8. E.O. No. 2-RS-2-34-91 reopened the Little Susitna River drainage and all freshwater drainages of Knik Arm to fishing for sockeye salmon. Effective noon, July 29 through December 31, 1991.
9. E.O. No. 2-RS-2-36-91 rescinded E.O. No. 2-RS-1-29-91, thereby reopening recreational sockeye salmon fisheries within waters of the Kenai Peninsula and Susitna-West Cook Inlet regulatory areas and marine waters of Cook Inlet north of Anchor Point. Effective 7:00 a.m. August 2 through December 31, 1991.
10. E.O. No. 2-CS-2-38-91 closed the Eklutna Power Plant tailrace to sport fishing from the Old Glenn Highway downstream to department markers placed approximately 100 yards upstream of the confluence of the tailrace and the Knik River. Effective noon, August 6 through December 31, 1991.
11. E.O. No. 2-SS-2-42-91 increased bag and possession limits to 5 coho salmon at the Little Susitna River downstream from the department's salmon counting weir at River Mile 32.5. Effective noon, August 14 through December 31, 1991.
12. E.O. No. 2-BB-2-52-91 reduced the bag and possession limits for burbot from 15 per day and in possession to 5 per day and in possession and reduced gear to two closely attended lines while fishing through ice in the Big Lake drainage (Houston area). Effective December 1, 1991 until superseded by regulation or subsequent emergency order.

**Appendix D1.-Page 2 of 5.**

13. E.O. No. 2-BB-2-53-91 closed Nancy Lake (Mile 64 Parks Highway) to burbot fishing. Effective December 1, 1991 until superseded by regulation or subsequent emergency order.

**Emergency Orders issued in 1992:**

1. E.O. No. 2-KS-2-08-92 reduced the length of the king salmon season and reduced the daily bag and possession limit for king salmon to 1 fish greater than 16 inches in length in all waters draining into Cook Inlet between Cape Douglas and the Susitna River, excluding the Susitna River. Additionally, this emergency order required the release of all king salmon 16 inches or more in length and the use of unbaited, artificial lures in all waters of the Chuitna River drainage upstream of a department marker located at the old cable crossing, and all waters of the Theodore River drainage upstream of a department marker located approximately 1 river mile upstream of the main Beluga haul road bridge. Effective May 26 through July 13, 1992.
2. E.O. No. 2-KS-2-12-92 clarified that Willow Creek is open to king salmon fishing on Saturday, Sunday and Monday for 3 consecutive weeks. Effective June 20 through June 22, 1992.
3. E.O. No. 20-KS-2-14-92 opened Willow Creek from its mouth upstream to the Parks Highway bridge and all waters within a one-quarter mile radius of Willow Creek's confluence with the Susitna River to king salmon fishing. Effective June 23 through June 26, 1992.
4. E.O. No. 2-KS-2-15-92 reduced the daily bag limit for king salmon, 16 inches or more in length, to 1 fish in all waters of the Susitna and Little Susitna River drainages. It further required the release of all king salmon, 16 inches or more in length, and the use of unbaited artificial lures in all waters of the Deshka River drainage between the Deshka River's confluence with Trapper Creek and the confluence of Moose and Kroto creeks (The Forks); and in all waters of the Alexander Creek drainage upstream from Alexander Creek's confluence with Trail Creek. Effective June 22 through July 13, 1992.
5. E.O. No. 2-RS-2-21-92 opened the Fish Creek personal use dip net fishery. Dip net fishing was allowed for 3 consecutive days followed by a 1 day closure on a continuing basis. Effective 6:00 a.m. July 23 through August 6, 1992.
6. E.O. No. 2-SS-2-22-92 closed to fishing that portion of the Little Susitna River from the fish counting weir located at River Mile 33 downstream for a distance of 1,500 feet. Effective July 25 through September 14, 1992.
7. E.O. No. 2-RS-2-28-92 closed the Susitna River drainage to sockeye salmon fishing. Effective July 31 through December 31, 1992.
8. E.O. No. 2-SS-2-29-92 increased bag and possession limits to 5 coho salmon 16 inches or more in length downstream from the department's counting weir at River Mile 32.5. Effective August 15 through December 31, 1992.

**Appendix D1.-Page 3 of 5.**

**Emergency Orders issued in 1993:**

1. E.O. No. 2-RS-2-23-93 opened the Fish Creek personal use fishery. The dip net fishery opened 9:00 a.m. July 24 and closed midnight August 6, with the fishery being closed July 26, July 30, and August 3, 1993.
2. E.O. No. 2-SS-2-25-93 closed to fishing that portion of the Little Susitna River from the fish counting weir located at River Mile 33 downstream for a distance of 1,500 feet. Effective July 23 through September 15, 1993.
3. E.O. No. 2-SS-2-32-93 increased the bag and possession limits to 5 coho salmon at the Little Susitna River downstream from the department's counting weir at River Mile 32.5. Effective August 11 through December 31, 1993.
4. E.O. No. 2-SS-2-33-93 closed to fishing that portion of Jim Creek from the fish counting weir located at River Mile 1 downstream for a distance of 500 feet. Effective August 12 through November 1, 1993.

**Emergency Orders issued in 1994:**

1. E.O. No. 2-RS-2-28-94 opened the Fish Creek personal use fishery. The dip net fishery opened 9:00 a.m. July 27 and closed midnight August 5, with the fishery being closed July 29 and August 2, 1994.
2. E.O. No 2-RS-2-33-94 supersedes E.O. 2-RS-2-28-94 extending the Fish Creek Personal Use Dip Net Fishery through midnight August 9. Effective August 7, 1994 through August 9, 1994.
3. E.O. No. 2-KS-2-05-94 closed to fishing that portion of the Little Susitna River from the fish counting weir located at River Mile 33 downstream for a distance of 1,500 feet. Effective May 25 through September 15, 1994.
4. E.O. No. 2-SS-2-32-94 increased the bag and possession limits to 5 coho salmon at the Little Susitna River downstream from the department's counting weir at River Mile 32.5. Effective August 6 through December 31, 1994.
5. E.O. No. 2-SS-2-29-94 closed that portion of Jim Creek to fishing from the fish counting weir located at River Mile 1 downstream for a distance of 1,000 feet. Effective July 26, 1994 through November 1, 1994.
6. E.O. No. 2-KS-2-02-94 reduced the chinook salmon possession limit to 1 fish and eliminated the use of bait in the Deshka River. Effective May 1, 1994 through July 13, 1994.
7. E.O. No. 2-KS-2-13-94 closed all waters of the Deshka River drainage to sport fishing for chinook salmon and prohibited the use of bait in the following waters of the Susitna River drainage: (1) all waters of the Susitna River drainage downstream of the Deshka River which flow into the Susitna River from the east and the Alexander Creek drainage, (2) all waters of the Yentna River drainage, (3) all waters of the Talkeetna River drainage, and (4) all waters of the Chulitna River drainage. Effective June 17, 1994 through July 13, 1994.

**Appendix D1.-Page 4 of 5.**

**Emergency Orders issued in 1995:**

1. E.O. No. 2-KS-2-07-95 closed to fishing that portion of the Little Susitna River from the fish counting weir located at River Mile 33 downstream for a distance of 1,900 feet. Effective May 25 through September 15, 1995.
2. E.O. No. 2-KS-2-08-95 established a possession limit of 1 king salmon 16 inches or more in length in the Little Susitna River. Effective May 24 through September 15, 1995.
3. E.O. No. 2-KS-2-21-95 opened Willow Creek from its mouth upstream to the Parks Highway bridge and all waters within a one-quarter mile radius of Willow Creek's confluence with the Susitna River to king salmon fishing effective 12:01 a.m., Tuesday, July 4 through midnight Tuesday, July 4.
4. E.O. No. 2-RS-02-32-95 opened the Fish Creek personal use fishery. The dip net fishery opened 5:00 a.m. July 26 and closed midnight August 8, with the fishery being closed July 28 and August 1 and August 4, 1995.
5. E.O. No. 2-SS-02-40-95 increased the bag and possession limits to 5 coho salmon at the Little Susitna River downstream from the department's counting weir at River Mile 32.5. Effective August 9 through December 31, 1995.

**Emergency Orders issued in 1996:**

1. E.O. No. 2-S-01-96 closed commercial salmon fishing in the Northern District of Upper Cook Inlet for fishing periods June 10, 17, and 24, 1996.
2. E.O. No. 2-KS-2-27-96 opened Willow, Little Willow, Sheep and Montana creeks from their mouth upstream to the Parks Highway bridge and all waters within a one-quarter mile radius of their confluence with the Susitna River to king salmon fishing effective 12:01 a.m., Thursday, July 4 through midnight Sunday, July 7, 1996.

**Emergency Orders issued in 1997:**

1. E.O. No. 2-KS-2-15-97 opened the Deshka River, from the mouth to approximately 2 miles upstream and within a one-quarter mile radius of the Susitna River confluence, to fishing for king salmon over 16 inches in length from 6:00 a.m. through 11:00 p.m. daily through July 13, 1997.
2. E.O. No. 2-KS-2-18-97 opened eastside Susitna River streams to king salmon fishing on July 4, 1997.
3. E.O. No. 2-RS-2-25-97 closed Fish Creek dipnetting from 11:00 a.m. July 23 through 11:00 p.m. July 25, 1997.
4. E.O. No. 2-RS-2-28-97 closed Fish Creek dipnetting for the remainder of the 1997 season on July 26, 1997.

**Appendix D1.-Page 5 of 5.**

5. E.O. No. 2-SS-02-31-97 prohibited use of bait and reduced daily bag and possession limit of coho salmon to one in all waters of Cook Inlet on August 9, 1997. Areas not included were Eklutna Tailrace, Ship, Bird, and Campbell creeks.
6. E.O. No. 2-SS-2-34-97 closed Wasilla Creek downstream from the railroad bridge, including Rabbit Slough and Spring Creek, to sport fishing August 23 through October 31, 1997.

**Emergency Orders issued in 1998:**

1. E.O. No. 2-KS-2-08-98 establishes that in the Deshka River when an angler harvests a king salmon 16 inches or more in length they must quit fishing for king salmon for the remainder of the day clarifying a regulation that went into effect when the Deshka River was opened to king salmon fishing for the 1998 season.
2. E.O. No. 2-KS-2-09-98 opens Willow Creek for king salmon fishing June 20-22, 1998.
3. E.O. No. 2-KS-2-12-98 adds Friday July 3 as a day open to king salmon fishing in that portion of the Susitna River drainage upstream from its confluence with the Deshka River to its confluence with the Talkeetna River including Susitna River tributaries from Willow Creek to Trapper Creek.
4. E.O. No. 2-KS-2-14-98 closes the Deshka River to all fishing 1,200 feet downstream and 300 feet upstream of the fish counting weir.
5. E.O. No. 2-RS-2-15-98 closes Fish Creek to dipnetting effective July 25, 1998 through July 31, 1998.

**Emergency Orders issued in 1999:**

1. E.O. No. 2-KS-2-05-99 closed the Deshka River to fishing from 1,000 yards downstream to 200 yards upstream of the fish counting weir.
2. E.O. No. 2-KS-2-07-99 allowed the use of bait in the first 17 miles of the Deshka River and within a ¼ mile radius of the mouth of the Deshka River with the Susitna River, June 22 through July 13, 1999.
3. E.O. No. 2-KS-2-11-99 opened Willow, Little Willow, Sheep and Montana creeks to king salmon fishing for an additional weekend, July 10 through July 12, 1999.
4. E.O. No. 2-RS-2-15-99 closed Fish Creek to dipnetting on July 26, 1999.
5. E.O. No. 2-SS-2-20-99 reduced the bag limit to one coho salmon and no bait for Cottonwood, Wasilla and Fish creeks and the Little Susitna River, on August 19, 1999.

## **APPENDIX E**

### **Appendix E1.-Chinook salmon regulatory history for NCIMA waters.**

Chinook salmon fishing in NCIMA waters was open from statehood through 1963. During 1964 through 1966 chinook salmon fishing in fresh water was closed. During 1967 through 1970 Alexander Creek, Clear Creek, Deshka River and Lake Creek were open in their entirety. This fishery operated over a 15-day season during the middle of June on a 250 fish, over 20 inches in length, harvest quota system. Achievement of the quota may have resulted in early season closure. A 1 fish per day 2 per season bag limit for fish over 20 inches in length was in place and a punch card was a requirement of participation in the fishery. In 1971 the harvest quota was eliminated. During 1971 and 1972, in addition to the 15-day season in Alexander Creek, Deshka River, and Lake Creek, a more restrictive fishery was allowed (few days) in Clear Creek and portions of the Little Susitna River, Ship Creek (Anchorage) and Willow Creek; however, a punch card was still required. In 1973, the area chinook salmon fishery was closed to the harvest of chinook salmon 20 inches or larger in length and remained so through 1978.

Selected Susitna River streams were reopened to chinook salmon fishing in 1979 after being closed for several years because of low stock abundance. Cautious incremental expansion has characterized the area's chinook salmon fisheries since they reopened. From 1979 through 1982 chinook salmon fishing was permitted at Alexander Creek, Lake Creek and at the Deshka River from the fourth Saturday in May through July 6. These streams drain into the Susitna River from the west. Clear Creek, a tributary of the Talkeetna River, also had a similar chinook salmon season. In addition, three eastside tributaries of the Susitna River, Willow, Caswell and Montana creeks, were open on Saturdays and Sundays only for 4 consecutive weekends commencing on the second Saturday in June. Harvest quotas, ranging from 200 to 7,000 chinook salmon, governed these fisheries from 1979 through 1982. The Chuitna River, a coastal stream near Beluga, and the entire Yentna and Talkeetna River drainages were opened to chinook salmon fishing in 1983. The opening date for chinook salmon fisheries that provided continuous daily fishing was also changed to January 1.

In 1984 the remaining coastal streams near Beluga and all waters draining into the westside of the Susitna River downstream from the Deshka River were opened to chinook salmon fishing. In 1986, portions of five road-accessible streams on the east side of the Susitna River opened to weekend-only fishing. These streams were Little Willow, Goose, Sunshine, Sheep and Birch creeks.

Expanded chinook salmon fishing opportunity continued in 1987 when Monday fishing was added to all former weekend-only fisheries that drain into the Susitna River from the east. Saturday through Monday fishing was also allowed on the Susitna River and all flowing waters within one-quarter mile of the Susitna River (excluding the Kashwitna River) between the Deshka and Talkeetna rivers. These "corridor" fisheries were open for 4 continuous "weekends" similar to the previously mentioned Saturday through Monday fisheries. Chinook salmon fishing was permitted for the first time on the Susitna River drainage upstream from the Susitna River's confluence with the Talkeetna River to Devil's Canyon but excluding the Chulitna River drainage. Unbaited, single-hook, artificial lures were mandatory in this area. The season extended from January 1 through July 13. The season for all Susitna River and coastal fisheries that formerly closed on July 6 was extended to July 13 in 1987.

## Appendix E1.-Page 2 of 6.

In 1989, chinook salmon fishing was allowed within a one-quarter mile radius of the mouth of the Kashwitna River. That same year fishing was permitted daily at Willow Creek between January 1 and the third Monday in June and on Saturday through Monday for 2 consecutive weeks starting the fourth Saturday in June.

Bag and possession limits were 1 chinook salmon 20 inches or over in length in 1979. The following year bag and possession limits changed to 2 chinook salmon 20 inches or over in length but only 1 chinook salmon could be over 28 inches in length. In 1981 the bag limit was reduced to 1 chinook salmon 20 inches or more in length and in possession. This limit remained in effect through 1985. A 5 fish (20 inches or more in length) per year limit governed all Cook Inlet chinook salmon fisheries from 1979 through 1985. This limit applied collectively to Northern Cook Inlet fresh water, Cook Inlet salt water and the Kenai Peninsula.

In 1986, bag and possession limits for the western drainages of the Susitna River were changed to 2 chinook salmon, 16 inches or more in length daily and 4 in possession and remained so through 1992. Only 1 fish daily and 2 in possession could be over 28 inches. Similar limits also applied to the West Cook Inlet coastal fisheries. Bag and possession limits for eastern drainages of the Susitna River in 1986 were 1 chinook salmon, 16 inches or more in length, and 2 in possession. The seasonal limit was 5 chinook salmon 16 inches or more in length. Anglers were required to list their chinook salmon harvest on nontransferable harvest records from 1979 through 1988. The date and location of harvested chinook salmon were recorded. A \$5 permit stamp was mandatory for chinook salmon fishing from 1980 through 1982. The harvest record and yearly limit was eliminated for all NCI chinook salmon fisheries in 1989.

During the November 1992 BOF meeting several regulations were changed in the Susitna West-Cook Inlet Management Area to be in effect for the 1993 season. A seasonal limit of 5 chinook salmon was established for all waters of Cook Inlet. Individuals or companies engaged in freshwater sport fish guiding were prohibited from participating or engaging in sport fishing while clients were present or within his or her control or responsibility during the chinook salmon season except when guiding a client subject to the Americans with Disabilities Act.

In effect for the 1993 season in the West Cook Inlet area the chinook salmon fishing season was reduced in length to end on June 30. The bag and possession limits were reduced in areas open to the retention of chinook salmon 16 inches or more in length to 1 daily and 1 in possession.

Additionally, in the following areas of West Cook Inlet only unbaited, artificial lures could be used and chinook salmon 16 inches or more in length could not be possessed or retained; all chinook salmon caught had to be released immediately: (1) Chuitna River Drainage: upstream of a department marker located adjacent to the old cable crossing; (2) Theodore River Drainage: upstream of a department marker located approximately 1 mile upstream of the Beluga/Anchorage high voltage power lines; and (3) Lewis River Drainage: upstream of a department marker located approximately 1 river mile upstream of the main Beluga haul road bridge.

### **Appendix E1.-Page 3 of 6.**

Action during the November 1992 meeting also reduced the chinook salmon bag and possession limit in the Susitna River drainage including all flowing waters draining into the west side of the Susitna River downstream of and including the Deshka River. The bag and possession limits for chinook salmon over 16 inches were reduced to 1 daily and 2 in possession.

In addition to BOF action, legislative action during June of 1992 established provisions that prohibited resident or nonresident anglers from fishing in Alaska without a king salmon stamp beginning in 1993.

In anticipation of an inadequate return to the Deshka River, prior to the 1994 chinook season an emergency order was issued reducing the chinook salmon possession limit to 1 fish and eliminated the use of bait in the Deshka River May 1 through July 14. As the 1994 chinook season progressed it became apparent a weak return was occurring in the entire Susitna River drainage and particularly in the Deshka River. In response to this an emergency order was issued closing all waters of the Deshka River to sport fishing for chinook salmon and prohibiting the use of bait in all waters of the Susitna River drainage downstream of the Deshka River which flow into the Susitna River from the east and the Alexander Creek drainage, all waters of the Yentna River drainage, all waters of the Talkeetna River drainage, and all waters of the Chulitna River drainage, June 17 through July 13, 1994.

The BOF during its October 1994 work session choose to delegate to the department the authority to change regulations for the 1995 fishing season. These regulation changes were as follows:

1. The Deshka River and Prairie Creek are closed to fishing for chinook salmon;
2. Alexander Creek above the confluence of Trail Creek is closed to fishing for chinook salmon;
3. The bag and possession limits in the Susitna River and Little Susitna River drainages have been reduced to 1 chinook salmon over 16 inches in length;
4. The use of bait throughout the NCIMA is prohibited (excluding the Anchorage Management Unit);
5. Fishing in the NCIMA is allowed only between the hours of 6:00 a.m. and 11:00 p.m. May 15 through July 13. This time restriction will not apply to that portion of the Susitna River drainage currently opened to weekend-only fishing (e.g. between, but not including, the Deshka River and the Talkeetna River) and the Anchorage Management Unit; and
6. The first opening of the Northern District commercial chinook salmon fishery will occur by emergency order. Additional opening of this fishery will be dependent upon inseason indications of run strength.

The only new regulation for the 1996 season was the closure of the Lewis River to king salmon fishing, including catch-and-release for king salmon.

## Appendix E1.-Page 4 of 6.

The Alaska Board of Fisheries convened in Anchorage, Alaska during November 11-17, 1996. A brief summary of regulatory changes affecting the Susitna-West Cook Inlet Area chinook salmon fisheries as adopted by the Board of Fisheries follows.

### 5 AAC 21.366. Northern District King Salmon Management Plan

- To fulfill changes to the Upper Cook Inlet King Salmon Management Plan, as adopted by the Board of Fisheries, the Department of Fish and Game shall manage the Northern District commercial king salmon fishery as follows:
  1. (3) The harvest shall not exceed 12,500 king salmon.
  2. (8) The season closes on June 24, unless closed earlier by emergency order.
  3. (9) The number of regular periods shall be determined by the department based on preseason expectations of king salmon run strength.
  4. (10) The area from 1 mile south of the Theodore River to the Susitna River is closed to fishing; provisions of this paragraph do not apply after December 31, 1998.
  5. (11) If at least 90% of the biological escapement goal for the Theodore River (BEG=750) or Chuitna River (BEG=1,400) is not met during the 1997 fishing season, the area from 1 mile south of the Chuitna River to the Susitna River will be closed to commercial fishing during the 1998 fishing season; the provisions of this paragraph do not apply after December 31, 1998.
  6. (12) In addition to (11) above, if at least 90% of the biological escapement goal for the Chuitna River has not been met during the 1997 fishing season, the area from 1 mile south of the Chuitna River to the Susitna River will be closed to sport fishing for king salmon during the 1998 fishing season; the provisions of this paragraph do not apply after December 31, 1998.

### 5 AAC 61.010. Fishing Seasons:

- The Alexander Creek drainage is open to the retention (harvest) of king salmon from January 1 through June 30 downstream from an ADF&G regulatory marker at Granite Creek.

### 5 AAC 61.020. Bag Limits, Possession Limits, and Size Limits:

- In all waters of Alexander Creek drainage between an ADF&G regulatory marker located at Granite Creek, upstream to an ADF&G regulatory marker located 400 yards upstream of Trail Creek, king salmon 16 inches or more in length may not be possessed or retained. All king salmon caught must be released immediately.

### 5 AAC 61.035. Methods and Means:

- Only unbaited, single-hook, artificial lures may be used from January 1 through June 30 in all waters of the Alexander Creek drainage between an ADF&G regulatory marker located at Granite Creek to an ADF&G regulatory marker located 400 yards upstream of Trail Creek.

## Appendix E1.-Page 5 of 6.

### 5 AAC 61.050. Waters Closed to Sport Fishing:

1. Peters Creek (Susitna River drainage) is closed to sport fishing for king salmon upstream from an ADF&G regulatory marker, located approximately 1 mile upstream from its confluence with the Kahiltna River.
2. The Theodore River is closed to sport fishing for king salmon. The provisions of this paragraph do not apply after December 31, 1998.

### 5 AAC 61.020. Bag Limits, Possession Limits, and Size Limits:

1. In all waters of the Susitna River drainage between the confluence of the Deshka River and the confluence of the Talkeetna River: after taking a king salmon 16 inches or more in length, a person may not fish for any species of fish in any water open to king salmon fishing during that same day.
2. In the Little Susitna River from its mouth to the Parks Highway bridge at Houston: after taking a king salmon 16 inches or more in length, a person may not fish for any species of fish in any water open to king salmon fishing during that same day.
3. In all waters of the Susitna-West Cook Inlet Management Area, excluding the Susitna River between its confluence with the Deshka River and its confluence with the Talkeetna River: after taking a king salmon 16 inches or more in length, a person may not fish for king salmon during that same day.

### 5 AAC 61.020. Bag Limits, Possession Limits, and Size Limits:

- The bag and possession limits of king salmon 16 inches or more in length taken from the Little Susitna River drainage are 1 fish per day and in possession.

During 1997 the Deshka River was open to king salmon fishing on June 21 though July 13. Fishing was limited to the lower 2 miles of river and all chinook salmon regulations applying to the Susitna River from its mouth to its confluence with the Deshka River were in effect for the Deshka River.

In 1998 the Deshka River was open to king salmon fishing from its confluence with the Susitna River upstream 5 miles to a Department marker. The seasonal bag limit for king salmon over 16 inches from the Deshka River was set at 2. In addition, all chinook salmon regulations applying to the Susitna River from its mouth to its confluence with the Deshka River were in effect for the Deshka River. Inseason E.O.s affecting chinook salmon fishing opened Willow Creek June 20-22 to correct an oversight in the regulations and added one Friday to chinook fishing in the Susitna River between the Deshka River and the Talkeetna River (excluding both).

The BOF made the following changes for the 1999 season. The Deshka River will be open to king salmon fishing from its mouth upstream to Chijuk Creek a distance of approximately 19 river miles from January 1 to July 13. Other area regulations apply such as 1 fish per day bag and possession limits, a 5 fish seasonal limit, and once an angler harvests his or her king salmon they must quit fishing for king salmon the remainder of the day. Additionally fishing is allowed

## Appendix E1.-Page 6 of 6.

only between the hours of 6:00 a.m. to 11:00 p.m., no bait is allowed and guides cannot fish while guiding clients.

The area open for retention of king salmon on Alexander Creek was extended from its mouth upstream to Trail Creek. This provides anglers with an additional 11 miles of stream from the 1997 and 1998 seasons in which they may harvest king salmon on Alexander Creek.

The Theodore River was opened to catch-and-release fishing for king salmon from January 1 through June 30, only single hook artificial lures will be allowed. Other West Cook Inlet Area Regulations apply as follows: fishing is allowed only between the hours of 6:00 a.m. to 11:00 p.m., bait is prohibited, and guides cannot fish while guiding.

There will be increased fishing opportunities for the road-accessible Parks Highway streams (Eastside Susitna River tributaries) during the early part of June. The Parks Highway streams (Eastside Susitna River tributaries) will open to king salmon fishing from January 1 through the third Monday in June and for the next two consecutive 3-day weekends. This regulation identifying the fishing season is consistent with that on Willow Creek.

On the Little Susitna River, anglers will be allowed to use treble hooks year-round downstream of the Parks Highway Bridge. Existing bait restrictions were modified to allow the use of bait during the month of September.

The area open to king salmon fishing on the Kashwitna River was extended from its mouth upstream to the Parks Highway Bridge, a distance of 2 miles. The Kashwitna River, a Parks Highway stream, will be regulated under the new season regulation implemented for the Parks Highway streams.

In all waters of the Westside-Susitna River and West Cook Inlet Management Areas (excluding waters between the Deshka River and the Talkeetna River mouths), anglers will be allowed to continue to fish for king salmon (catch-and-release) once they have harvested their limit excluding Alexander Creek, Lake Creek, Deshka River, Fish Lake Creek and Clear Creek. In these streams you will be required to quit fishing for king salmon for the day once you have harvested your limit.

By E.O. Willow, Little Willow, Sheep and Montana creeks were open to king salmon fishing for an additional weekend, July 10 through July 12, 1999.

## **Appendix E2.-Coho salmon regulatory history for NCIMA waters, 1991-1999.**

### **1991**

1. Little Susitna River Coho Salmon Management Plan (5 AAC 61.060). Initiated in 1991 season. One coho salmon January 1 through August 5, 3 coho salmon August 6 through December 31, increase to 5 coho salmon below weir and at Nancy Lake Creek when 7,500 projected above Parks Highway, quit fishing when bag limit harvested below Burma Landing. Previously there was a 3 salmon daily bag limit, all 3 of which could be coho salmon.

#### Emergency Orders:

1. E.O. No. 2-SS-2-27-91 closed to fishing that portion of the Little Susitna River from the fish counting weir located at River Mile 32.5 downstream for a distance of 1,500 feet. Effective July 27 through September 14, 1991.
2. E.O. No. 2-RS-1-29-91 closed sockeye salmon fishing in all waters north of the latitude of Anchor Point. Effective 7:00 a.m. July 26 through December 31, 1991.
3. E.O. No. 2-RS-2-33-91 opened the Fish Creek personal use dip net fishery. Effective July 30 through August 9, 1991.
4. E.O. No. 2-RS-2-34-91 reopened the Little Susitna River drainage and all freshwater drainages of Knik Arm to fishing for sockeye salmon. Effective noon, July 29 through December 31, 1991.
5. E.O. No. 2-RS-2-36-91 rescinded E.O. No. 2-RS-1-29-91, thereby reopening recreational sockeye salmon fisheries within waters of the Kenai Peninsula and Susitna-West Cook Inlet regulatory areas and marine waters of Cook Inlet north of Anchor Point. Effective 7:00 a.m. August 2 through December 31, 1991.
6. E.O. No. 2-CS-2-38-91 closed the Eklutna Power Plant tailrace to sport fishing from the Old Glenn Highway downstream to department markers placed approximately 100 yards upstream of the confluence of the tailrace and the Knik River. Effective noon, August 6 through December 31, 1991.
7. E.O. No. 2-SS-2-42-91 increased bag and possession limits to 5 coho salmon at the Little Susitna River downstream from the department's salmon counting weir at River Mile 32.5. Effective noon, August 14 through December 31, 1991.

### **1992**

1. Little Susitna River Coho Salmon Management Plan modified. In effect for 1993 season. Only unbaited artificial lures may be used in the Little Susitna River from July 15 through August 5. The bag and possession limits for coho salmon 16 inches or more in length during this time period were increased to 3 daily and in possession.
2. Aimed at rainbow trout. Only unbaited artificial lures may be used in all flowing waters of the Susitna-West Cook Inlet area September 1 through May 15. Initiated in 1993 season.

**Appendix E2.-Page 2 of 5.**

3. Changes in the Cook Inlet Personal Use Salmon Dip Net Fishery Management Plan (5 AAC 77.540) pertaining to the Fish Creek dip net fishery. 1993 was the first year coho salmon were allowed in the harvest. Daily bag and possession limit 6 salmon.
4. BOF found that most of Cook Inlet was a nonsubsistence zone and repealed the Upper Cook Inlet Subsistence Salmon Management Plan (5 AAC 01.592) thus eliminating the subsistence fishery in Upper Cook Inlet for the 1993 season (eliminated the Knik set gillnet fishery). This plan was reinstated by court action for the 1994 season. The only area that remained open to subsistence fishing in the Upper Cook Inlet area during 1993 was the Tyonek subdistrict of the Northern District on the west side of Cook Inlet.

Emergency Orders:

1. E.O. No. 2-RS-2-21-92 opened the Fish Creek personal use dip net fishery. Dip net fishing was allowed for 3 consecutive days followed by a 1 day closure on a continuing basis. Effective 6:00 a.m. July 23 through August 6, 1992.
2. E.O. No. 2-SS-2-22-92 closed to fishing that portion of the Little Susitna River from the fish counting weir located at River Mile 33 downstream for a distance of 1,500 feet. Effective July 25 through September 14, 1992.
3. E.O. No. 2-RS-2-28-92 closed the Susitna River drainage to sockeye salmon fishing. Effective July 31 through December 31, 1992.
4. E.O. No. 2-SS-2-29-92 increased bag and possession limits to 5 coho salmon 16 inches or more in length downstream from the department's counting weir at River Mile 32.5. Effective August 15 through December 31, 1992.

**1993**

Emergency Orders:

1. E.O. No. 2-RS-2-23-93 opened the Fish Creek personal use fishery. The dip net fishery opened 9:00 a.m. July 24 and closed midnight August 6, with the fishery being closed July 26, July 30, and August 3, 1993.
2. E.O. No. 2-SS-2-25-93 closed to fishing that portion of the Little Susitna River from the fish counting weir located at River Mile 33 downstream for a distance of 1,500 feet. Effective July 23 through September 15, 1993.
3. E.O. No. 2-SS-2-32-93 increased the bag and possession limits to 5 coho salmon at the Little Susitna River downstream from the department's counting weir at River Mile 32.5. Effective August 11 through December 31, 1993.
4. E.O. No. 2-SS-2-33-93 closed to fishing that portion of Jim Creek from the fish counting weir located at River Mile 1 downstream for a distance of 500 feet. Effective August 12 through November 1, 1993.

## Appendix E2.-Page 3 of 5.

### 1994

#### Emergency Orders:

1. E.O. No. 2-RS-2-28-94 opened the Fish Creek personal use fishery. The dip net fishery opened 9:00 a.m. July 27 and closed midnight August 5, with the fishery being closed July 29 and August 2, 1994.
2. E.O. No 2-RS-2-33-94 supersedes E.O. 2-RS-2-28-94 extending the Fish Creek Personal Use Dip Net Fishery through midnight August 9. Effective August 7, 1994 through August 9, 1994.
3. E.O. No. 2-KS-2-05-94 closed to fishing that portion of the Little Susitna River from the fish counting weir located at River Mile 33 downstream for a distance of 1,500 feet. Effective May 25 through September 15, 1994.
4. E.O. No. 2-SS-2-32-94 increased the bag and possession limits to 5 coho salmon at the Little Susitna River downstream from the department's counting weir at River Mile 32.5. Effective August 6 through December 31, 1994.
5. E.O. No. 2-SS-2-29-94 closed that portion of Jim Creek to fishing from the fish counting weir located at River Mile 1 downstream for a distance of 1,000 feet. Effective July 26, 1994 through November 1, 1994.

### 1995

1. Upper Cook Inlet Subsistence Salmon Management Plan was repealed by the BOF in 1995. BOF took action to allow subsistence fishery as a personnel use fishery. The Knik set gillnet fishery was executed as a personal use fishery in 1995.

#### Emergency Orders:

1. E.O. No. 2-KS-2-07-95 closed to fishing that portion of the Little Susitna River from the fish counting weir located at River Mile 33 downstream for a distance of 1,900 feet. Effective May 25 through September 15, 1995.
2. E.O. No. 2-RS-02-32-95 opened the Fish Creek personal use fishery. The dip net fishery opened 5:00 a.m. July 26 and closed midnight August 8, with the fishery being closed July 28 and August 1 and August 4, 1995.
3. E.O. No. 2-SS-02-40-95 increased the bag and possession limits to 5 coho salmon at the Little Susitna River downstream from the department's counting weir at River Mile 32.5. Effective August 9 through December 31, 1995.

### 1996

1. The Upper Cook Inlet Personal Use Salmon Fishery Management Plan (5 AAC 77.540) establishes time, area, methods and means for taking salmon for personal use. This plan first went into effect during the 1996 season. It provides for personal use dip net fisheries in the Kenai and Kasilof rivers and Fish Creek. Additionally, limited personal use gillnet fishing

**Appendix E2.-Page 4 of 5.**

opportunity is provided near the terminus of the Kasilof River. No Knik set gillnet fishery was provided.

2. Changes were made to the Fish Creek Sockeye Management Plan (5 AAC 21.364) concerning the Fish Creek Personal Use Dipnet fishery. The dip net fishery will now run July 10 through July 31 with a bag limit of 25 salmon per head of household plus 10 salmon per each household member. A permit is required.
3. The Skwentna River Personal Use Salmon Fishery Management Plan (5 AAC 77.526) establishes a subsistence fish wheel fishery in the Yentna River downstream of its confluence with the Skwentna River. This fishery was implemented as a personal use fishery during the 1996 and 1997 seasons.
4. Little Susitna River Coho Salmon Management Plan was modified. The option to increase the bag and possession limits of coho salmon in specified areas of the Little Susitna River when the escapement goal of 7,500 nonhatchery fish upstream of the Parks Highway is projected, was repealed. The bag and possession limits of salmon other than king salmon in the Little Susitna River are 3 fish per day and in possession.
5. Aimed at rainbow trout but could affect late-season coho salmon fishing. Only unbaited, single-hook, artificial lures may be used in all flowing waters of the Alexander Creek drainage upstream of an ADF&G regulatory marker located 400 yards upstream of the confluence of Trail Creek.

**1997**

Emergency Orders:

1. E.O. No. 2-RS-2-25-97 closed Fish Creek dipnetting from 11:00 a.m. July 23 through 11:00 p.m. July 25, 1997.
2. E.O. No. 2-RS-2-28-97 closed Fish Creek dipnetting for the remainder of the 1997 season on July 26, 1997.
3. E.O. No. 2-SS-02-31-97 prohibited use of bait and reduced daily bag and possession limit of coho salmon to one in all waters of Cook Inlet on August 9, 1997. Areas not included were Eklutna Tailrace, Ship, Bird, and Campbell creeks.
4. E.O. No. 2-SS-2-34-97 closed Wasilla Creek downstream from the railroad bridge, including Rabbit Slough and Spring Creek, to sport fishing August 23 through October 31, 1997.

**Appendix E2.-Page 5 of 5.**

**1998**

1. The Upper Yentna River Subsistence Salmon Fishery (5 AAC 01.593) establishes a subsistence fish wheel fishery in the Yentna River downstream of its confluence with the Skwentna River. This fishery was implemented as a personal use fishery during the 1996 and 1997 seasons. State Supreme Court and BOF action changed it to a subsistence fishery beginning in 1998. This change did not affect coho salmon harvest.

Emergency Orders:

1. E.O. No. 2-KS-2-14-98 closes the Deshka River to all fishing 1,200 feet downstream and 300 feet upstream of the fish counting weir.
2. E.O. No. 2-RS-2-15-98 closes Fish Creek to dipnetting effective July 25, 1998 through July 31, 1998.

**1999**

1. Recreational fishing time on Fish, Wasilla and Cottonwood creeks has been reduced. Fishing hours were restricted from 24-hour fishing days to 12-hour fishing days (6:00 a.m. to 6:00 p.m.) in these Saturday and Sunday only fisheries. Once you have harvested your bag limit of three salmon you may no longer fish on this stream for the remainder of the day.
2. In all waters of West Cook Inlet South of the Susitna River (i.e. Chuitna, Lewis, Theodore & McArthur River) once you have harvested your bag limit of 3 coho salmon you may no longer fish on this stream for the remainder of the day. These same streams are closed to coho salmon fishing from October 1-December 31
3. For the Little Susitna River existing bait restrictions were modified to allow the use of bait during the month of September.
4. Little Susitna River Coho Salmon Management Plan was modified. The escapement goal of 7,500 coho salmon was changed to an escapement range of 9,600-19,200 nonhatchery fish.

Emergency Orders:

1. E.O. No. 2-KS-2-05-99 closed the Deshka River to fishing from 1,000 yards downstream to 200 yards upstream of the fish counting weir.
2. E.O. No. 2-RS-2-15-99 closed Fish Creek to dipnetting on July 26, 1999.
3. E.O. No. 2-SS-2-20-99 reduced the bag limit to 1 coho salmon and no bait for Cottonwood, Wasilla and Fish creeks and the Little Susitna River, on August 19, 1999.

## **APPENDIX F**

## **Appendix F1.-Board of Fisheries NCIMA regulatory changes made from November 1992 through December 1999.**

### **1993 Season**

#### **King Salmon Entire Area**

A seasonal limit of 5 king salmon was established for all waters of Cook Inlet. Anglers harvesting a king salmon must immediately enter in ink on the back of their sport fishing license, in the appropriate location, the waters fished, species harvested, and date the fish was harvested. Anglers without an annual sport fishing license (anglers younger than 16 years of age and Alaska residents at least 60 years of age) must obtain a king salmon harvest record card prior to king salmon fishing. On harvesting a king salmon they must mark the harvest card accordingly.

The Board also adopted as regulation a proposal which stated that an individual or company engaged in freshwater sport fish guiding may not participate or engage in sport fishing while clients are present or within his or her control or responsibility during the king salmon season, except when guiding a client subject to the Americans with Disabilities Act.

In addition to BOF action, during the first legislative session in June of 1992, legislators passed House Bill 596. This bill included provisions that prohibited resident or nonresident anglers from fishing for king salmon in Alaskan waters unless they have purchased the current year's king salmon tag and have it in possession. King salmon tags are valid from January 1 through December 31. Anglers must stick the tag on the back of their sport fishing license and validate it by signing their name across the tag. Anglers can purchase king salmon tags at the same time they buy their 1993 sport fishing license from their local vendor. There are five groups of resident anglers who are not required to purchase a king salmon tag: (1) blind anglers who qualify for a 25-cent license; (2) anglers under the age of 16; (3) anglers 60 years of age or older who have been a resident of the state for at least 1 year; (4) disabled veterans who are eligible for a free sport fishing license; and (5) anglers who qualify for a \$5 sport fishing license. All nonresident anglers are required to purchase a tag if they are fishing for king salmon in Alaska.

#### **King Salmon - West Cook Inlet Area**

The king salmon fishing season was reduced in length to end on June 30. The bag and possession limits were reduced in areas open to the retention of king salmon 16 inches or more in length to 1 daily and 1 in possession.

In the following areas only unbaited, artificial lures may be used, and king salmon 16 inches or more in length may not be possessed or retained; all king salmon caught must be released immediately:

1. Chuitna River Drainage: upstream of a department marker located adjacent to the old cable crossing;
2. Theodore River Drainage: upstream of a department marker located approximately 1 mile upstream of the Beluga/Anchorage high voltage power lines; and
3. Lewis River Drainage: upstream of a department marker located approximately 1 river mile upstream of the main Beluga haul road bridge.

**Appendix F1.-Page 2 of 11.**

**King Salmon - Susitna River Drainage**

(including all flowing waters draining into the west side of the Susitna River downstream of and including the Deshka River)

The bag and possession limit for king salmon over 16 inches was reduced to 1 daily and 2 in possession.

**Coho Salmon - Little Susitna River**

The management plan for the Little Susitna River was modified. Only unbaited artificial lures may be used in the Little Susitna River from July 15 through August 5. The bag and possession limits for coho salmon 16 inches or more in length during this time period were increased to 3 daily and in possession.

**Rainbow Trout**

In Big Lake the rainbow trout bag limit was reduced to 2 daily and in possession. In the upper Cook Inlet area only 1 rainbow trout per day and 2 per season may be over 20 inches in length.

Long, X, and Wishbone lakes are closed to sport fishing from November 1 through April 30.

The North Fork of the Kashwitna River was established as a special management area for rainbow trout. Only single-hook, unbaited, artificial lures may be used in the North Fork of the Kashwitna River and rainbow trout may not be possessed or retained; all rainbow trout caught must be released immediately.

Only unbaited artificial lures may be used in all flowing waters of the Susitna-West Cook Inlet area (except when fishing for burbot when using legal gear for burbot as described under burbot in the section) from September 1 through May 15, except in areas in which special regulations are in effect. Areas with special regulations in effect generally require the use of unbaited artificial lures year-round and further stipulate that rainbow trout may not be possessed or retained.

In the Lake Creek drainage, rainbow trout may not be possessed or retained in all flowing waters from August 15 through May 15, upstream from a department marker located approximately 100 yards upstream from its confluence with the Yentna River to a department marker located approximately one-quarter mile upstream from Bulchitna Lake. Only single-hook unbaited artificial lures may be used in this area during this time period. The Lake Creek drainage upstream from the Bulchitna Lake marker continues to be managed as a catch-and-release area for rainbow trout.

**Burbot**

In the Susitna-West Cook Inlet area set lines are prohibited. Burbot may be taken with more than one line and hook if: (1) the total number of aggregate hooks does not exceed the daily bag limit for waters being fished; (2) the hooks are single hooks with a gap between point and shank larger than three-quarters of an inch; (3) each hook is set to sit on the bottom of the lake or stream; and (4) the burbot gear is closely attended.

The daily bag and possession limits for burbot are 5 daily and in possession in all waters of Susitna-West Cook Inlet Area.

Nancy Lake is closed to the harvest of burbot.

**Lake Trout**

The bag and possession limits for lake trout are 2 daily and in possession in all waters of Susitna-West Cook Inlet.

**Three Mile Creek**

Three Mile Creek in the West Cook Inlet area: that portion of Three Mile Creek from the road crossing upstream to Three Mile Lake and including that portion of Three Mile lake within a 300-foot radius of the outlet is closed to all fishing.

**Fish Creek Personal Use**

Changes in the Cook Inlet Personal Use Salmon Dip Net Fishery Management Plan pertaining to the Fish Creek dip net fishery are as follows:

1. The fishery will be opened by emergency order after July 23 on Saturdays, Sundays, and Wednesdays to the taking of sockeye and coho salmon provided the spawning escapement of sockeye salmon into Big Lake drainage is projected to exceed 50,000 fish;
2. Additional fishing time can be established by emergency order provided that no more than 3 consecutive days of fishing is allowed without a minimum of 1 day of closure if escapement into Fish Creek warrants such action;
3. The area to be open to harvesting salmon by dip net includes waters upstream from a department marker located at the mouth of Fish Creek to a department marker located approximately one-quarter mile upstream of the Knik-Goose Bay Road;
4. The daily bag and possession limit is 6 salmon not in addition to the daily sport fish bag and possession limit;
5. The fishery shall close the second Friday in August, or earlier by emergency order if the harvest of coho salmon becomes excessive in department opinion.

**Subsistence**

In December of 1992 the BOF found that most of Cook Inlet was a nonsubsistence zone and repealed the Upper Cook Inlet Subsistence Management Plan thus eliminating the subsistence fishery in Upper Cook Inlet. The only area that remained open to subsistence fishing in the Upper Cook Inlet area was the Tyonek subdistrict of the Northern District on the west side of Cook Inlet. A court ruling in November of 1993 which found this action by the BOF to be unconstitutional again allowed a subsistence fishery in Upper Cook Inlet for the 1994 season.

**1995 Season**

During their October 1994 meeting in Fairbanks the BOF delegated authority to restrict chinook salmon harvests in Northern Cook Inlet to the commissioner of the ADF&G to address stock conservation concerns. The following regulations will be in effect for the 1995 chinook salmon season:

**King Salmon-Entire Area**

1. The Deshka River and Prairie Creek are closed to fishing for chinook salmon;
2. Alexander Creek above the confluence of Trail Creek is closed to fishing for chinook salmon;
3. The bag and possession limits in the Susitna River drainage have been reduced to 1 chinook salmon over 16 inches in length;
4. The use of bait throughout the NCIMA is prohibited;
5. Fishing in the NCIMA is allowed only between the hours of 6:00 a.m. and 11:00 p.m. May 15 through July 13. This time restriction will not apply to that portion of the Susitna River drainage currently opened to weekend-only fishing (e.g. between, but not including, the Deshka River and the Talkeetna River); and
6. By emergency order only the first opening of the Northern District commercial chinook salmon fishery will occur. Additional opening of this fishery will be dependent upon inseason indications of run strength.

**1996 Season**

The Alaska Board of Fisheries convened in Anchorage, Alaska during March 1996. A brief summary of regulatory changes affecting the Susitna-West Cook Inlet Area as adopted by the Board of Fisheries follows.

1. The Lewis River is closed to king salmon fishing, including catch-and-release for king salmon.
2. Changes were made to the Fish Creek Sockeye Management Plan concerning the Fish Creek Personal Use Dipnet fishery. The dip net fishery will now run July 10 through July 30 with a bag limit of 25 salmon per head of household plus 10 salmon per each household member. A permit is required.

**Appendix F1.-Page 5 of 11.**

3. The Skwentna River Personal Use Management Plan was established. Salmon, other than chinook salmon, may be taken as follows:
  - a. A permit is required which shall be returned to ADF&G with the harvest recorded;
  - b. In the mainstem of the Yentna River from its confluence with Martin Creek upstream to its confluence with the Skwentna River from July 15 through July 31 from 4:00 a.m. through 8:00 p.m. Monday, Wednesday and Friday;
  - c. Only with a fish wheel as follows: (a) each fish wheel must be equipped with a livebox; the livebox must be constructed so that it contains no less than 45 cubic feet of water volume while it is in operation; (b) the permit holder shall attach a wood or metal plate that is at least 12 inches high by 12 inches wide, bearing the permit holder's name and address in letters and numerals at least one inch high, so that the name and address are plainly visible; (c) the permit holder shall be present to attend the fish wheel at all times while the fish wheel is in operation, and chinook salmon and rainbow trout must be returned alive to the water; (d) a live box is a submerged container that is attached to the fish wheel that will keep fish caught by the fish wheel alive;
  - d. Only one permit may be issued to each household per year and the annual limit for the fishery is 25 salmon for the head of household and 10 salmon for each dependent of the permit holder;
  - e. The commissioner shall close the personal use fishery, by emergency order, as necessary to ensure that no more than 2,500 salmon are taken during the entire season under this section;
  - f. The provisions of this plan do not apply after December 31, 1999.

**1997 Season**

The Alaska Board of Fisheries convened in Anchorage, Alaska during November 1996. A brief summary of regulatory changes affecting the Susitna-West Cook Inlet Area as adopted by the Board of Fisheries follows.

**King Salmon**

5 AAC 21.366. Northern District King Salmon Management Plan

To fulfill changes to the Upper Cook Inlet King Salmon Management Plan, as adopted by the Board of Fisheries, the Department of Fish and Game shall manage the Northern District commercial king salmon fishery as follows:

1. The harvest shall not exceed 12,500 king salmon.
2. The season closes on June 24, unless closed earlier by emergency order.
3. The number of regular periods shall be determined by the department based on preseason expectations of king salmon run strength.

**Appendix F1.-Page 6 of 11.**

1. The area from 1 mile south of the Theodore River to the Susitna River is closed to fishing; provisions of this paragraph do not apply after December 31, 1998.
2. If at least 90% of the biological escapement goal for the Theodore River (BEG = 750) or Chuitna River (BEG = 1,400) is not met during the 1997 fishing season, the area from 1 mile south of the Chuitna River to the Susitna River will be closed to commercial fishing during the 1998 fishing season; the provisions of this paragraph do not apply after December 31, 1998.
3. In addition to above, if at least 90% of the biological escapement goal for the Chuitna River has not been met during the 1997 season, the Chuitna River will be closed to sport fishing for king salmon during the 1998 fishing season; the provisions of this paragraph do not apply after December 31, 1998.

5 AAC 61.010. Fishing Seasons:

1. The Alexander Creek drainage is open to the retention (harvest) of king salmon from January 1 through June 30 downstream from an ADF&G regulatory marker at Granite Creek.

5 AAC 61.020. Bag Limits, Possession Limits, and Size Limits:

1. In all waters of Alexander Creek drainage between an ADF&G regulatory marker located at Granite Creek, upstream to an ADF&G regulatory marker located 400 yards upstream of Trail Creek, king salmon 16 inches or more in length may not be possessed or retained. All king salmon caught must be released immediately.
2. In all waters of the Susitna River drainage between the confluence of the Deshka River and the confluence of the Talkeetna River: after taking a king salmon 16 inches or more in length, a person may not fish for any species of fish in any water open to king salmon fishing during that same day.
3. In the Little Susitna River from its mouth to the Parks Highway bridge at Houston: after taking a king salmon 16 inches or more in length, a person may not fish for any species of fish in any water open to king salmon fishing during that same day.
4. In all waters of the Susitna-West Cook Inlet Management Area, excluding the Susitna River between its confluence with the Deshka River and its confluence with the Talkeetna River: after taking a king salmon 16 inches or more in length, a person may not fish for king salmon during that same day.
5. The bag and possession limits of king salmon 16 inches or more in length taken from the Little Susitna River drainage are 1 fish per day and 1 in possession.

5 AAC 61.035. Methods and Means:

1. Only unbaited, single-hook, artificial lures may be used from January 1 through June 30 in all waters of the Alexander Creek drainage between an ADF&G regulatory marker located at Granite Creek to an ADF&G regulatory marker located 400 yards upstream of Trail Creek.

**Appendix F1.-Page 7 of 11.**

5 AAC 61.050. Waters Closed to Sport Fishing:

1. Peters Creek (Susitna River drainage) is closed to sport fishing for king salmon upstream from an ADF&G regulatory marker, located approximately 1 mile upstream from its confluence with the Kahiltna River.
2. The Theodore River is closed to sport fishing for king salmon.

**Rainbow Trout (Resident Species)**

5 AAC 61.020. Bag Limits, Possession Limits, and Size Limits:

1. Rainbow trout may not be possessed or retained in all waters of the Prairie Creek drainage and within one-quarter mile of its confluence with the Talkeetna River.
2. In Prairie Creek the bag and possession limits for Arctic grayling are 2 fish.
3. Rainbow trout, Dolly Varden, whitefish, and Arctic grayling may not be possessed or retained in all waters of the Alexander Creek drainage and within one-quarter mile of its confluence with the Susitna River. Northern pike may be possessed and retained.

5 AAC 61.035: Methods and Means:

1. Only unbaited, single-hook, artificial lures may be used in the Prairie Creek drainage and within one-quarter mile of its confluence with the Talkeetna River.
2. Only unbaited, single-hook, artificial lures may be used in all flowing waters of the Alexander Creek drainage upstream of an ADF&G regulatory marker located 400 yards upstream of the confluence of Trail Creek.
3. Unbaited, single-hook, artificial lures are required year-round upstream of the Parks Highway in Rabideux Creek, Montana Creek, Goose Creek, Caswell Creek, Kashwitna River, Grays Creek, Little Willow Creek, Sheep Creek, Willow Creek, and Little Susitna River, and upstream of a department regulatory marker in Birch Creek drainage, Sunshine Creek drainage, and upstream of the Petersville Road in Trapper Creek.
4. Only unbaited, single-hook, artificial lures may be used from September 1 through May 31 in all waters of the above described drainages and in all waters within a one-half mile radius of their confluence with the Susitna River or the mouth of the Little Susitna River.
5. Unbaited, single-hook, artificial lures are required year-round in the Willow Creek drainage upstream of a department marker located one-quarter mile upstream from its confluence with the Susitna River and in all waters of the Willow Creek drainage and within a one-half mile radius of its confluence with the Susitna River from September 1 through May 31.
6. Only unbaited, single-hook, artificial lures may be used year-round in Montana Creek upstream of the Parks Highway. Only unbaited, single-hook, artificial lures may be used in Montana Creek downstream of the Parks Highway and in all waters within a one-half mile radius of its confluence with the Susitna River from September 1 through May 31.

**Appendix F1.-Page 8 of 11.**

5 AAC 61.050. Waters Closed to Sport Fishing:

1. Fish Lake Creek drainage upstream of the first lake is closed to salmon fishing from July 14 through December 31.
2. All waters of Rabideux Creek, Trapper Creek, Grays Creek, and the Kashwitna River within a one-quarter mile radius of their confluence with the Susitna River are closed to sport fishing from June 1 through July 13, except during king salmon season as authorized by 5 AAC 61.010(f)(2). King salmon season commences the second Saturday through Monday in June and continues for three additional consecutive 3-day weekends thereafter.

5 AAC 61.020. Bag Limits, Possession Limits, and Size Limits:

1. The retention of rainbow trout in the Willow Creek drainage and in all waters within one-half mile radius of its confluence with the Susitna River is prohibited. All rainbow trout caught in the Willow Creek drainage and within a one-half mile radius of its confluence with the Susitna River must be immediately released.
2. The retention of rainbow trout is prohibited in Montana Creek drainage and all waters within a one-half mile radius of its confluence with the Susitna River.
3. The bag and possession limits for rainbow trout in all flowing waters and nonstocked lakes of the Susitna West-Cook Inlet Area open to the retention of rainbow trout are 2 rainbow trout of which 1 may be over 20 inches in length and the bag and possession limits in stocked lakes are 5 rainbow trout of which 1 may be over 20 inches in length. Stocked lakes are: Barley, Bear Paw, Bench, Benka, Beverly, Big No Luck, Upper and Lower Bonnie, Bruce, B-J, Canoe, Carpenter, Christiansen, Coyote, Crystal, Dawn, Diamond, Echo, Farmer, Finger, Lalen, Little Lonely, Little No Luck, Loberg (Junction), Long (Glenn Highway MP 86), Loon, Lorraine, Lucille, Lynne, Marion, Matanuska, Meirs, Memory, Morvro, North Friend, Prator, Ravine, Reed, Rocky, Ruby, Seventeenmile, Seymour, Slipper, South Friend, South Rolly, Tigger, Twin Island, Vera, Victor, Visnaw, Walby, Weiner, West Sunshine, Willow, Wolf, and Y.

**Northern Pike**

5 AAC 61.035: Methods and Means:

1. Sport fishing for northern pike using five (5) lines is allowed in specified lakes of the Susitna West-Cook Inlet Area provided: hooks are single hooks with a gap between the point and shank no smaller than three-quarters inch, the lines are closely attended, and all species of fish other than northern pike are immediately released. Specified lakes include: Alexander Lake, Sucker Lake, Trapper Lake, Flathorn Lake, Whiskey Lake, Hewitt Lake, Donkey Lake, Three Mile Lake (Beluga area), Neil Lake, Kroto Lake, and lakes of the Nancy Lake Recreation Area excluding Nancy and Big No Luck Lake.

5 AAC 61.020. Bag Limits, Possession Limits, and Size Limits:

1. The 10 fish bag and possession limits on northern pike in the Susitna-West Cook Inlet Area were repealed. There are no bag, possession or size limits on northern pike in the Susitna-West Cook Inlet Area.

**Burbot**

5 AAC 61.035: Methods and Means:

1. In flowing waters of the Susitna River and Yentna River the requirement that burbot lines specified in 5 AAC 61.035 (h)(1),(2), and (3) be closely attended is repealed. The 24-hour requirement (each line must be physically inspected at least once during each 24-hour period) notwithstanding, burbot lines in the specified waters are not required to be closely attended.

**Coho salmon**

5 AAC 61.060: Little Susitna River Management Plan.

1. The option to increase the bag and possession limits of coho salmon in specified areas of the Little Susitna River when the escapement goal of 7,500 nonhatchery fish upstream of the Parks Highway is projected, was repealed. The bag and possession limits of salmon other than king salmon in the Little Susitna River are 3 fish per day and in possession.

**Miscellaneous**

5 AAC 61: Reformat the Susitna West-Cook Inlet Area Codified Regulations.

1. The format of the Susitna West-Cook Inlet codified regulation summary will be changed to agree with the format of other management areas.

**October 1997 BOF meeting**

A petition to open the Deshka River to king salmon fishing was presented to the Board by the public. The Board delegated authority to the Commissioner of the Department of Fish and Game to open the Deshka River to king salmon fishing in 1998 with regulation guidelines. The first 5 miles of river were opened and a seasonal bag limit was set at 2 fish. Additionally, those regulations applying to the Susitna River from its mouth to its confluence with the Deshka River were applied to the Deshka River.

**October 1998 BOF meeting**

The Alaska BOF convened in Wasilla, Alaska during October 1998. A brief summary of regulatory changes affecting the Susitna-West Cook Inlet Area as adopted by the BOF follows.

**Resident Finfish**

1. Action resulted in a change to the Big Lake Arctic char bag and possession limits and established minimum size limit. The bag and possession limits changed in Big Lake from 2 per day 2 in possession to 1 per day 1 in possession with a minimum length requirement of 20 inches. Also, a special provision was established that requires the use of unbaited, single-hook, artificial lures from November 1 through April 30.
2. Action resulted in allowing the retention of 1 rainbow trout under 16 inches in length per day and in possession upstream of the Parks Highway bridge on Willow Creek. Downstream of the Parks Highway bridge rainbow trout may not be possessed or retained.

**Appendix F1.-Page 10 of 11.**

3. Action resulted in allowing the use of bait and provides for the retention of rainbow trout in the Willow Creek drainage lakes. The bag and possession limits in Shirley, Long, and Rainbow lakes are 2 per day and 2 in possession with only 1 over 20 inches in length. The bag and possession limits in Willow and Crystal lakes is 5 per day and 5 in possession with only 1 over 20 inches in length.
4. Action resulted in prohibiting the retention of rainbow trout in Canyon Creek and established special provisions allowing only the use of single-hook, unbaited, artificial lures in Canyon Creek.
5. Action resulted in prohibiting the retention of rainbow trout in flowing waters of West Cook Inlet and the Susitna River drainage from April 15 to June 14. This regulation applies to all flowing waters in these areas including Willow Creek.
6. Established a slot limit for northern pike in Alexander and Trappers lakes. No bag and possession limits are in effect for pike less than 22 inches in length. Northern pike between 22 inches and 30 inches in length may not be retained. The bag and possession limits for pike 30 inches or greater in length are 1 per day and 1 in possession. Additionally, the action taken for Alexander and Trappers lakes reduced the number of lines allowed when fishing through the ice for northern pike from 5 lines to 2 lines, and prohibited the use of spears and bow and arrows for taking of northern pike.
7. Action resulted in allowing the use of bow and arrow for taking northern pike in NCI waters.
8. Action resulted in eliminating the 3/4-inch single-hook size restriction when fishing through the ice on select northern Cook Inlet lakes where 5 lines are allowed.
9. Action resulted in establishing a Dolly Varden size restriction. The regulation now allows for the retention of only 1 Dolly Varden greater than 12 inches in length to be retained per day. The bag limit remains 5 fish per day, with 5 in possession for all NCI and Anchorage area flowing waters.

**February 1999 BOF Meeting**

1. Proposal 261. The Deshka River will be open to king salmon fishing from its mouth upstream to Chijuk Creek a distance of approximately 19 river miles from January 1 to July 13. Other area regulations apply such as 1 fish per day bag and possession limits, a 5 fish seasonal limit, and once an angler harvests his or her king salmon they must quit fishing for king salmon the remainder of the day. Additionally fishing is allowed only between the hours of 6:00 a.m. to 11:00 p.m., no bait is allowed and guides cannot fish while guiding clients.
2. Proposal 273. The area open for retention of king salmon on Alexander Creek was extended from its mouth upstream to Trail Creek. This provides anglers with an additional 11 miles of stream from the 1997 and 1998 seasons in which they may harvest king salmon on Alexander Creek.

**Appendix F1.-Page 11 of 11.**

3. Proposal 263. The Theodore River was opened to catch-and-release fishing for king salmon from January 1 through June 30, only single-hook artificial lures will be allowed. Other West Cook Inlet Area Regulations apply as follows: fishing is allowed only between the hours of 6:00 a.m. to 11:00 p.m., bait is prohibited, and guides cannot fish while guiding.
4. Proposal 265. There will be increased fishing opportunities for the road-accessible Parks Highway streams (Eastside Susitna River tributaries) during the early part of June. The Parks Highway streams (Eastside Susitna River tributaries) will open to king salmon fishing from January 1 through the third Monday in June and for the next two consecutive 3-day weekends. This regulation identifying the fishing season is consistent with that on Willow Creek.
5. Proposal 274. On the Little Susitna River, anglers will be allowed to use treble hooks year-round downstream of the Parks Highway Bridge. Existing bait restrictions were modified to allow the use of bait during the month of September.
6. Proposal 268. The area open to king salmon fishing on the Kashwitna River was extended from its mouth upstream to the Parks Highway Bridge, a distance of 2 miles. The Kashwitna River, a Parks Highway stream, will be regulated under the new season regulation implemented for the Parks Highway streams.
7. Proposal 269. In all waters of the Westside-Susitna River and West Cook Inlet Management Areas (excluding waters between the Deshka River and the Talkeetna River mouths), anglers will be allowed to continue to fish for king salmon (catch-and-release) once they have harvested their limit excluding Alexander Creek, Lake Creek, Deshka River, Fish Lake Creek and Clear Creek. In these streams you will be required to quit fishing for king salmon for the day once you have harvested your limit.
8. Proposal 193. Recreational fishing time on Fish, Wasilla and Cottonwood creeks has been reduced. Fishing hours were restricted from 24-hour fishing days to 12-hour fishing days (6:00 a.m. to 6:00 p.m.) in these Saturday and Sunday only fisheries. Once you have harvested your bag limit of 3 coho salmon you may no longer fish on these streams for the remainder of the day.
9. Proposal 260. In all waters of West Cook Inlet south of the Susitna River (i.e. Chuitna, Lewis, Theodore & McArthur rivers) once you have harvested your bag limit of 3 coho salmon you may no longer fish on these streams for the remainder of the day. These same streams are closed to coho salmon fishing commencing October 1-December 31.

## **APPENDIX G**

## Appendix G1.-Northern Cook Inlet Management Area northern pike waters.

### Susitna Basin Lakes

#### Alexander Creek

1. Alexander Lake
2. Sucker Lake
3. Trail Lake
4. Rabbit Lake

#### Lower Susitna

1. Flathorn Lake
2. Figure 8 Lake

#### Mid Susitna

1. Witsoe Lake
2. Witsol Lake
3. Lockwood Lake
4. Lady Slipper
5. Unnamed

## **APPENDIX J**

**Appendix J1.-Cooperative agreement for management and maintenance of the Little Susitna River Public Use Facility.**

ADF&G COOP 89-024

Cooperative Agreement Between  
Alaska Department of Natural Resources and  
Alaska Department of Fish and Game for  
Management and Maintenance of  
Little Susitna River Public Use Facility

This agreement is made and entered into between the Department of Natural Resources, P.O. Box 10-7001, Anchorage, Alaska 99510, hereinafter called ADNR, and the Department of Fish and Game, P.O. Box 3-2000, Juneau, Alaska 99802, hereinafter referred to as ADF&G.

I. Purpose of Agreement

To cooperatively manage and maintain the Little Susitna Public Use Facility (LSPUF) for recreational boating, sport fishing, access to the state game refuge and other recreational uses.

II. Authority

ADF&G, pursuant to AS 16.05, has the authority to design and construct projects beneficial for the fish and game resources of the state; to provide public facilities to facilitate the taking of fish and game; to enter into cooperative agreements; to exercise administrative, budgeting, and fiscal powers; and to manage uses and activities on the Susitna Flats State Game Refuge (SFSGR).

ADNR, pursuant to AS 41.21, has the authority to provide for the supervision, development, and maintenance of public recreational land; and to provide clearinghouse services for other state agencies concerned with park and recreational matters.

III. Covenants of the Department of Fish and Game

ADF&G does hereby agree:

1. To construct a boat launch, parking area, and other facilities necessary to improve public recreational boating and sport fishing access to the lower Little Susitna River under the Federal Aid in Sport Fish Restoration program.
2. To contribute access program funds to defer the cost of site management and maintenance in the event that such costs exceed revenues from user fees. The annual amount of the funds shall not exceed the total cost shown in Attachment B.

IV. Covenants of the Department of Natural Resources

ADNR does hereby agree:

1. To operate and manage the site described in Attachment A for the primary purpose of providing public access to the Little Susitna River and the Susitna Flats State Game

Refuge (SFSGR) for recreational boating, sport fishing, and other recreational activities. No change in this use shall be made nor shall the site be closed to the public without the approval of ADF&G.

2. To perform all maintenance and management necessary to keep the access site shown in Attachment A open to the public on a seasonal basis. Services shall include public contact, law enforcement, trash collection, parking lot grading, cleaning of comfort stations, posting of signs, and other minor maintenance needed to keep the site clean and in a good state of repair.
3. To prepare an annual management plan detailing the services to be provided, staffing and equipment requirements, estimated costs, estimated revenue and proposed improvements. This management plan shall become a part of this agreement as Attachment B.
4. To account for and dispose of all user fees collected from the sites in accordance with OMB circular A-102. All fees shall be reviewed and approved by ADF&G prior to implementation. Current approved fees shall be shown in Attachment B.

V. It is mutually agreed that

1. This agreement shall remain in effect indefinitely and shall be renewed annually by revision of Attachment B. This agreement and all subsequent annual renewals shall be effective February 1 of the year shown on Attachment B and shall remain in effect through January 31 of the following year. Either department may terminate this agreement by providing written notice to the other at least 90 days in advance of the date on which termination is to become effective.
2. The LSPUF shall be managed in accordance with regulations contained in 5 AAC 95.515. These regulations apply only to that portion of the SFSGR designated as a management zone for the LSPUF.
3. Each department shall not assign, let, or sublet, either by grant or implication, the whole or any part of any site without the written consent of the other department. The rights and responsibilities vested in each department by this agreement shall not be assigned without the written consent of the other department.
4. ADF&G shall retain administrative control of the LSPUF. ADNR may make improvements on the site provided such improvements are compatible with the primary purpose of providing recreational boating and sport fishing access to the Little Susitna River. All proposed improvements shall be approved by ADF&G through the special area permit process prior to construction. ADNR shall obtain all applicable permits prior to the start of construction.
5. Amendments to this agreement may be proposed by either department, and shall become effective upon approval of both departments. Each department may modify this agreement to meet revised requirements for state or federal law, provided that such modifications shall not cause either department financial loss or commit unavailable staff and resources.
6. Agents and employees of each department shall act in an independent capacity and not as officers, employees, or agents of the other department in performance of this agreement.

7. To not discriminate or permit discrimination on the grounds of race, color, religion, national origin, ancestry, age or sex against any person or group of persons in any manner prohibited by federal or state law or regulations promulgated thereunder. Each department recognizes the right of the other to take such action to enforce such covenant as it deems necessary or as it is directed pursuant to any federal or state law or regulation.
8. Nothing in this agreement shall be construed as obligating either department to expenditure of funds in excess of those herein agreed upon. In the event sufficient funds are not available to operate and maintain the site, ADNR may terminate this agreement with a seven day notice.
9. Nothing in this agreement transfers title or land jurisdiction other than set forth herein.
10. The failure of either department to insist in any one or more instances upon a strict performance by the other of any of the provisions, terms, covenants, reservations, conditions, or stipulations contained herein may not be considered as a waiver or relinquishment thereof for the future, but the same shall continue and remain in full force and effect, and no waiver by either department of any provision, term, covenant, reservation, condition, or stipulation herein may be deemed to have been made in any instance unless expressed in writing by the department.
11. Each department agrees that it will be responsible for its own acts and the results thereof, and each department shall not be responsible for the acts of the other department; and each department agrees it will assume to itself risk and liability resulting in any manner under this agreement.
12. No elected or appointed official shall be admitted to any share or part of the agreement or to any benefit that may arise therefrom.
13. Each party will comply with all applicable laws, regulations, and executive orders relative to Equal Employment Opportunity.
14. Nothing herein is intended to conflict with federal, state, or local laws or regulations. If there are conflicts, this agreement will be amended at the first opportunity to bring it into conformance with conflicting laws or regulations.
15. Policy and position announcements relating specifically to this cooperative program may be made only by mutual consent of the agencies.
16. This agreement is complete and has no other encumbrances, addenda, attachments, or amendments with the following exceptions:

Attachment A: Little Susitna Public Use Area Site Plan

Attachment B: Little Susitna Public Use Area Management Plan

Attachment A is not included in this report. Attachment B follows.

- Appendix B: Division of Parks & Outdoor Recreation Seasonal Report, 1996

Introduction

Construction of the Little Susitna Public Use Facility (PUF), under project F-13-D-6, provides access to the Little Susitna River. Initial clearing work and construction of one outhouse was completed in the fall of 1988. Construction on the remainder of the facilities was completed in June, 1990.

The facility needs regular maintenance to prevent vandalism and protect the access program's investment. This project will provide the funding that is needed to maintain and manage the facility.

Need

The need for the Little Susitna PUF is documented in the narrative for Project F-13-D-6, Little Susitna Boat Launch Development. This site provides the primary sport fishing access to the Little Susitna River. Although the facility was constructed to accommodate 70,000 angler-days of use annually, the full potential of the site has never been realized. Angler use of the Little Susitna River

is summarized in Table 1. Reliable records showing use of LSPUF are not available prior to the 1994 season.

Table 1. Angler-day use of the Little Susitna River.

<u>Year</u>	<u>Angler-days</u>
1989	54,798
1990	40,159
1991	50,838
1992	49,304
1993	42,249
1994	45,149
1995	41,119

The number of angler-days on the Little Susitna River during this seven year period fluctuates by almost 15,000. This variation in use reflects the relative run strengths of both king and silver salmon during this period and the timing of certain management techniques such as increasing bag limits and lifting bait restrictions. For instance, if lifting the bait restriction and increasing the bag limit for silver salmon happened to fall on a weekend during the peak of the run, significantly increased fishing pressure would occur compared to the same scenario happening on a weekday.

In considering the need for maintenance and management of the PUF, two factors must be taken into account. The first is the annual-use level and the second is how that use is distributed throughout this year. The annual-use level at the PUF is relatively high, but more importantly, use is concentrated on summer weekends particularly when the salmon runs are "in." Figure 1 shows use patterns for the 1996 season, which was interrupted by the Miller's Reach Fire. Table 2 summarizes all user groups at the facility during the 1994, 1995 and 1996 seasons.

A user data collection program was begun during the 1994 season. Adjustments were made in-season to ease data collection. Improvements to the system were incorporated into the 1995 data collection program based on problems encountered in analyzing the 1994 data.

Given a constant use rate, a site such as Little Susitna could be maintained and managed with little more than routine trash collection and cleanup. But with the concentrated use and resultant crowding that occurs, a much higher level of effort is necessary. In addition to keeping the site clean, an authoritative presence is needed to keep order and prevent vandalism.

The "Burma Road" site has been open to the public for many years and certain undesirable use patterns have developed. The area had been totally uncontrolled and rowdy behavior was common. A portion of the current user group still seems to resent improvement of the site and some continuing re-education of these individuals is necessary to make this site a quality experience for everyone.

The access program has made an investment of over \$1,000,000 in the Little Susitna PUF. A decision to simply leave this investment in the hands of the users without some means of control would not be prudent.

## Objectives

1. To ensure that the Little Susitna PUF is a clean, safe, well-maintained public access site.
2. To protect the access program's investment in the Little Susitna PUF.
3. To establish a revenue program that will defray maintenance, management, and future improvement costs.

## Expected Results and Benefits

This project will ensure that the results and benefits of the site improvements constructed under Project F-13-D-6, are obtained on a long-term basis.

## Project Development

Agreement has been reached with the Department of Natural Resources (DNR), Division of Parks and Outdoor Recreation (DPOR) to maintain and manage the Little Susitna PUF. A management plan for July 1, 1997 through June 30, 1998, is included in Appendix A. A report for the 1996 season is also included with this document.

DPOR will treat the site in the same manner as units of the State Park System. The services they will provide are described in Appendix A. In addition to janitorial-type services, DPOR will also provide a deputized ranger for the site. In light of the past history of the site, an authoritative presence is necessary to maintain order.

Prior to freezeup in the fall, the site is winterized to reduce over-winter damage from weather and vandals. Equipment such as the well and sanitary dump station is secured. The outhouses are pumped out but left open for use. During the winter months, DPOR will provide twice-weekly patrols of the site that include outhouse maintenance. There are a significant number of people who use the area during the winter for snowmachine riding, dog mushing, hunting, and other outdoor activities. DPOR has learned from experience that vandalism increases if an attempt is made to deny public use of outhouses during the winter. In this respect, winter patrols of the PUF and servicing of the outhouses are a measure designed to protect the facility rather than provide a service to the public.

The collection of fees through the 1993 season was accomplished primarily through the honor system and an "iron ranger." Problems with this approach developed and a citizens' work group was established in 1993 to recommend a new fee structure. This new fee system went into effect for the 1994 season. Part of this fee restructuring involved the construction and installation of a fee station at the entrance gate. This station was manned to collect the various fees beginning with the 1994 season. The fee station will continue in operation during the 1997 season. The current fee structure is shown in Appendix A.

The need for additional staff to man the fee station and improved service to the public on site by the Division of Parks and Outdoor Recreation are responsible for the overall increases in the cost to operate and maintain LSPUF. This increased cost has been offset somewhat through restructuring of fees and markedly improved public compliance with the fee structure because of the presence of fee station attendants. The unpredictable nature of fishermen, as shown in Table 1, further complicates the ability to predict the revenues which can be generated by the facility during any given year.

In addition to routine maintenance, one or two small projects are accomplished each year to correct or control situations that were not foreseen in the original design. This includes work such as additional barrier rocks, additional signage for parking and short-term repair of a hole at the end of the boat launch ramp.

NEPA Documentation

This project involves only maintenance and management activities that are categorically excluded from NEPA documentation requirements.
