April 22, 2021

Dear Friend,

Today, we celebrate Earth Day and join with members of the global community who are united in the need to protect our planet. We are faced with many critical challenges stemming from climate change, and it is clear we need innovative solutions to address these rising threats and safeguard our abundance of natural resources. Aquaculture, the production of protein through low impact methods, should be part of the solution as we seek ways to feed a global population sustainably.

A robust aquaculture industry would help support a sustainable seafood future by increasing our supply of protein responsibly. Aquaculture offers low carbon outputs and zero methane emissions with minimal reliance on scarce land and water resources. Shellfish and seaweed farming can also help clean the ocean and support strong ocean ecosystems.

By establishing a clear regulatory pathway for permitting sustainable offshore aquaculture, federal lawmakers can facilitate growth of a domestic industry to increase our protein supply through responsible means.

Best regards,

Stronger America Through Seafood
