ABSTRACT

This report describes the subsistence takes of harbor seals (*Phoca vitulina*) and Steller sea lions (*Eumetopias jubatus*) by Alaska Natives in 2005, including quantity, seasons, geographic distribution, and age and sex of the harvest. Information is summarized at the state, region, and community levels and is compared with annual takes since 1992. The research was conducted by the Division of Subsistence, Alaska Department of Fish and Game in cooperation with the Alaska Native Harbor Seal Commission and the Aleut Marine Mammal Commission, under contract with the National Marine Fisheries Service of the National Oceanic and Atmospheric Administration. Information derives from systematic interviews with hunters and users of marine mammals in 1,308 households in 62 coastal communities within the geographic ranges of the two species. Local researchers conducted most of the household interviews as part of regional research networks. The project received generous support from leaders of a number of Native governments and associations.

During 2005, the estimated subsistence take of harbor seals by Alaska Natives was 1,696 seals, with a 95 percent confidence range of between 1,354 to 2,306 seals. Of the take, 13.3 percent (226 seals) were struck and lost and 86.7 percent (1,470 seals) were harvested. The 2005 take of harbor seals came from the following stocks: Southeast Alaska stock (634 seals), Gulf of Alaska stock (958 seals), and Bering Sea stock (104 seals). Harbor seals were taken in 53 of 62 surveyed communities. Hunters reported taking males over females by about 2.5 to 1 and adults (76.6 percent) over juveniles (19.2 percent) or pups (4.1 percent). The 2005 take of harbor seals (1,696 seals) was the lowest recorded since 1992 – 2,854 (1992), 2,736 (1993), 2,621 (1994), 2,742 (1995), 2,741 (1996), 2,546 (1997), 2,597 (1998), 2,224 (2000), 2,031 (2001), 1,834 (2002), 2,030 (2003), and 1,822 (2004). Reasons for declining harbor seal harvests are uncertain, but declining harvests are associated with fewer seal hunters statewide, particularly in the Southeast Region where declines have been the largest.

During 2005, the estimated subsistence take of sea lions by Alaska Natives was 218 sea lions, with a 95 percent confidence range of between 169 to 301 sea lions. Of the take, 25.5 percent (56 sea lions) were struck and lost and 74.5 percent (162 sea lions) were harvested. Sea lions were taken in 15 of 62 surveyed communities. Hunters reported taking males over females by about 2.1 to 1 and adults (67.0 percent) over juveniles (30.9 percent) and pups (2.1 percent). Sea lion takes sharply declined from 1992 to 1995 with takes leveling off between 1996 to 2005 – 549 (1992), 487 (1993), 416 (1994), 339 (1995), 186 (1996), 164 (1997), 178 (1998), 171 (2000), 198 (2001), 185 (2002), 212 (2003), and 216 (2004). Declines in sea lion takes are associated with fewer hunters hunting sea lions, which is probably linked to local sea lion scarcities.

ACKNOWLEDGEMENTS

This project would not have been possible without tremendous local support in every community where we conducted the survey. We wish to thank each tribal council, city council, and all of the regional Native organizations that facilitated our work. Heartfelt thanks are owed to the many elders and local marine mammal experts who allowed us to interview them at length about their lifelong use and observations of sea lions and harbor seals. In addition, we are deeply indebted to the many hundreds of hunters who volunteered to report their subsistence harvests to our staff and to locally-hired research assistants.

The forty-nine local researchers who conducted household interviews deserve to be recognized individually for their high level of interest and work. We look forward to working with many again in the near future as the project moves into its fourteenth year:

INTRODUCTION

This report describes the subsistence takes of harbor seals (*Phoca vitulina*) and Steller sea lions (*Eumetopias jubatus*) by Alaska Natives during calendar year 2005. The report covers the thirteenth year documenting subsistence takes of harbor seals and sea lions in Alaska. Subsistence takes have been documented from 1992 through 2005, with no surveys in 1999 (Wolfe and Mishler 1993, 1994, 1995, 1996, 1997, 1998; Wolfe and Hutchinson-Scarborough 1999; Wolfe 2001; Wolfe, Fall, and Stanek 2002, 2003, 2004, 2005). The research for calendar year 2005 was conducted by the Division of Subsistence of the Alaska Department of Fish and Game, the Alaska Native Harbor Seal Commission, and the Aleut Marine Mammal Commission, under contract with the National Marine Fisheries Service of the National Oceanic and Atmospheric Administration. The research was conducted in cooperation with tribal governments in the study communities.

This report provides information on the subsistence takes of harbor seals and sea lions during 2005, including size, seasons, geographic distributions, and age and sex of harvested animals. Information on subsistence uses derives from systematic interviews with marine mammal hunters in 62 communities (Fig. 1, Table 2). Information was collected principally by local researchers trained in each community working within a network of local and regional researchers.

The geographic area covered by this report was defined as the Alaska coastal waters south of Cape Newenham, including the Pribilof Islands, which corresponds with the general distributions of harbor seals and sea lions in Alaska (Figs. 2 and 3, from Burns, Frost, and Lowry 1985). The use of harbor seals and sea lions by Alaska Natives for food and raw materials has a long tradition in this part of Alaska, since before historic contact through to the present. The Alaska Native groups using harbor seals

include the Aleut of the Aleutian Islands, the Alutiiq and Eyak of the Pacific Gulf coast, the Tlingit, Haida, and Tsimshian of the southeast archipelago, and the Yup'ik of southwest Alaska. More occasional use of harbor seals is made by the Dena'ina of Cook Inlet. The primary users of sea lions are the Aleut of the Aleutian and Pribilof islands and the Alutiiq of certain communities of Kodiak Island and the Gulf of Alaska. Sea lions are used more occasionally by Tlingit, Haida, Tsimshian, and Yup'ik groups. Subsistence products derived from harbor seals and sea lions by Alaska Natives include oil, meat, and skins, as described in Wolfe and Mishler (1993).

This report is organized in several sections. The Methodology section describes the methods used to collect information. Two sections (The Subsistence Take of Harbor Seals in 2005 and The Subsistence Take of Sea Lions in 2005) present information on the statewide takes of harbor seals and sea lions, summarized by community and region. In the Discussion section are interpretations of the 2005 survey year, including summaries of harvest patterns since 1992. Appendix A contains a copy of the survey instrument used in household interviews with marine mammal hunters. Appendix B contains regional summaries of the subsistence takes of harbor seals and sea lions. Appendix C contains materials on the subsistence takes of harbor seals and sea lions by community.

METHODOLOGY

This report includes information on the subsistence takes of harbor seals and sea lions in 62 coastal communities (Table 2). Information for 61 communities was collected in this project through interviews with persons in 1,308 Alaska Native households. In addition, the report includes information about subsistence takes of sea lions by hunters in St. Paul collected through a separate project run by the Ecosystem Conservation Office of the Aleut Community of St. Paul (Zavadil et al. 2006; see also Lestenkof and Zavadil 2001; Lestenkof et al. 2002; and Zavadil et al. 2003, 2004). In the Division of Subsistence study, respondents were asked to recall information about their household's use of harbor seals and sea lions during the previous year. The survey instrument administered in household interviews was similar to one used in 1992-2004, developed in consultation with the Rural Alaska Community Action Program (RurAL CAP) and the Indigenous People's Council for Marine Mammals (IPCoMM) (see Appendix A). Hunters and household heads were asked to recall the numbers of harbor seals and sea lions taken by household members during each month over the past year. The survey contained questions that pertained to harvest numbers, struck and lost animals, age of animals, and sex of animals. The survey also asked whether the household used, harvested, received, or gave away harbor seals or sea lions during the last year. Interviews were conducted by local researchers hired and trained as part of the project, augmented by regional researchers of the Alaska Native Harbor Seal Commission and the Division of Subsistence in select communities. A single survey was administered in January to March 2006 to cover the period from January through December 2005.

The project was designed to be a collaborative effort with Alaska Native hunters and organizations. During the first year of the study, a number of Native governments, Native leaders, and associations with interests in harbor seals and sea lions management were contacted to obtain suggestions about project design, including the

Alaska Federation of Natives, the Aleutians East Borough, Aleutian-Pribilof Islands Association, Bristol Bay Native Association, Central Council of Tlingit and Haida Indian Tribes of Alaska, Cook Inlet Region, Inc., IPCoMM (meeting through RurAL CAP), Kodiak Area Native Association, and the North Pacific Rim (now named Chugachmiut). RurAL CAP and IPCoMM served as the formal technical oversight organizations for the first five years of the project, through a subcontract with the Division of Subsistence. Since 1997, formal technical oversight for the project has been provided by the Alaska Native Harbor Seal Commission (ANHSC).

During 2005, the ANHSC received funding directly from the National Marine Fisheries Service and entered into a cooperative agreement with the Division of Subsistence to jointly conduct the harvest assessment project. The ANHSC provided a project coordinator and an analyst for writing the final report. The ANHSC coordinated the research activities in the Prince William Sound, Cook Inlet, Kodiak Island, and Southeast Alaska communities. Under the cooperative agreement, the Division of Subsistence coordinated research activities in other regions and was responsible for data analysis.

The survey in the Aleutian Islands region was conducted in cooperation with the Aleut Marine Mammal Commission (AMMC). The AMMC represents ten Alaska Native tribes in nine communities of the lower Alaska Peninsula and Aleutian Islands. The AMMC assisted with introducing the project in its member communities, helped identify local research assistants, and reviewed the survey instrument and draft study findings.

Copies of this final report were provided to the Alaska Sea Otter and Steller Sea Lion Commission (TASSC) by the Division of Subsistence.

As noted above, at St. Paul sea lion take information was collected by the Aleut Community of St. Paul's Ecosystem Conservation Office through a contract between the tribe and the National Marine Fisheries Service. The methodologies and findings of the tribal project are described in Zavadil et al. 2004. Data from that program pertaining to

five years at St. Paul (2000-2004) are included in this report, based on published papers (see Lestenkof and Zavadil 2001; Lestenkof et al. 2002; and Zavadil et al. 2003, 2006).

Support for the project was solicited from local Native governments or leaders of local government entities, for each community where surveys were conducted. During the first project year, contacts were made with representatives of all the entities listed in Table 1 and the project received support in the communities listed in Table 2. Many local governments have been extremely helpful during the course of the project, especially by identifying Native households, potential local researchers, and marine mammal experts in the community to contact.

The project was designed to protect the identities of surveyed participants. Marine mammal hunters and other respondents were informed that participation in interviews was completely voluntary. Respondents were told that their identities would be kept confidential in reports presenting the information. Permission to administer the household harvest survey was asked of each individual respondent, face-to-face at the person's home or during an initial phone contact. At this time, the purpose of the project was described. If a person declined to participate in the study, the person was thanked for his or her time and a survey was not conducted. Persons who were interviewed as part of the harvest survey were not paid. Most marine mammal hunters generously offered their assistance to the study.

As stated above, a network of locally-hired researchers, regional Division of Subsistence researchers, and ANHSC staff was used to collect information on subsistence takes of sea lions and harbor seals during 2005. Newly-hired local researchers received in-person training from regional researchers or ANHSC staff, whereas local researchers who successfully conducted surveys on previous rounds usually worked with regional researchers through telephone, e-mail, fax, and the mail. Local researchers performed tasks such as updating community lists of households and hunters, implementing household sampling regimes, administering household surveys

during the yearly cycle, data proofing of surveys and survey tracking forms, and mailing surveys and tracking sheets for data entry and analysis. Regional researchers performed tasks such as obtaining formal support for the project from Native organizations, recruiting and selecting local hires, developing household sampling regimes, training and supervising local researchers, proofing survey data, consulting local researchers to resolve data questions in preparation for data entry and analysis, writing reports on each community's survey experience, and entering field notes into a centralized database.

In 2005, 49 local researchers collected information in 52 communities. Five communities (Anchorage, Homer, Kenai-Soldotna, Seward, and Tyonek) were surveyed by the project coordinator with the ANHSC (Joni Byrant). New harvest information was not collected in seven communities (Hydaburg, Klukwan, Nikolski, Sand Point, Seldovia, St. George, and Wrangell) because effective local surveyors were not secured and funding constraints did not allow for additional work by regional researchers. In this report, data from the most recent survey cycle in each community were used for estimates in these seven communities, as noted in Appendix C. With no year-round households, Ivanof Bay was dropped as a survey community after 2002, although several households formerly residing at Ivanof Bay were included on the Perryville

household lists. Adak was added as a survey community after 2002 with about fifteen year-round Alaska Native households. As stated above, in recent years harvest information at St. Paul has been collected under a program of the St. Paul tribe. Harvest information for 2005 was not available at the time of this report's publication, so interim harvest estimates for St. Paul were used, based on 2004 harvest information as reported in Zavadil et al. (2006). The interim estimates will be updated in subsequent annual reports.

Households were selected using three main designs, depending upon the community -- census sampling, chain referral sampling, and two-strata random sampling. The type of design used for each community is shown in Table 2. Sampling designs and expansion methods were similar to those used the first study year, as described in Wolfe and Mishler (1993:17-19). Census sampling means all households with Alaska Natives were identified for contact. For chain referral communities, the sampling universe comprised all households with marine mammal hunters (based on past or potential activities), as identified by key respondents and other surveyed hunters in the community. In the two-strata random design, the high stratum comprised hunting households as identified by key respondents, and the low stratum comprised a random draw of households from the remaining Alaska Native households in the community.

For communities with census or chain referral sampling, 81.8 percent of identified households (1,067 of 1,305 households) were successfully contacted and interviewed. For communities with two-strata designs, 90.4 percent of high stratum households were successfully contacted and interviewed (113 of 125 households), while 26.3 percent of low stratum households were interviewed (128 of 487 households) (Tables 2 and 3). These are relatively high sampling fractions for studies using survey methodologies that rely upon voluntary participation by surveyed households. Overall, the level of cooperation by households in the harvest survey was high in all communities. The non-

response rate was due in large part to logistical problems in contacting households, rather than refusals to participate.

In the appendices, the statistical analysis presents harvest data in three different tables for each community. In the first table, the unexpanded reported take is presented for each community, representing actual animals reported killed by surveyed hunters with no fractions of animals. The second table presents the combined estimated expanded take for each stratum in the community. In this table, takes of surveyed hunters are expanded to unsurveyed hunters within the stratum, using different methods depending upon the household sampling design as described above. In this expansion, the proportions of the seasonal takes of the surveyed households are preserved, so takes with unknown months exist in the table. The expansion treats each community as a separate sampling universe. Fractions of animals commonly result from the expansion, which are rounded to the nearest tenth. The third table presents a seasonally-adjusted expanded take: takes with unknown months are assigned to months based on the proportion of the known take. The numbers in this third table form the basis for the numbers in the report's narrative. In addition, details of the expansion for two strata communities are shown for harbor seal takes in Table 25 and for sea lion takes in Table 26.

The calculation of the confidence range around the estimate follow methods for stratified samples in Cochran (1977:5.13, 5.15). In this process, the unexpanded reported take (that is, the known take) was used as the lower range for a community if it was higher than the statistically-calculated lower take estimate.

THE SUBSISTENCE TAKE OF HARBOR SEALS IN 2005

Estimated Size of the Harbor Seal Take, 2005

The estimated size of the total take of harbor seals (*Phoca vitulina*) by Alaska Natives in 2005 is presented in Tables 4 and 5. In 2005, there were an estimated 1,696 harbor seals taken by Alaska Natives for subsistence uses (with a 95 percent confidence range of between 1,354 to 2,306 animals) (Table 4). Of the 2005 subsistence take, 13.3 percent (226 harbor seals) were struck and lost, and 86.7 percent (1,470 harbor seals) were harvested.

The total state estimate for harbor seals is necessarily somewhat indeterminate because of species identification problems in the Bristol Bay area. As discussed in Wolfe and Mishler (1993:61-69), in Bristol Bay there are areas with a seasonal geographic overlap of harbor seals (*Phoca vitulina*) and spotted seals (*Phoca largha*) (see Fig. 3). Local indigenous Yup'ik taxonomies categorize adults of the two Linnaean species as a single type (*issuriq*) in this area, and categorize pups into two different types. Of the total North Bristol Bay take, we classified 33 seals as *Phoca vitulina* and 201 seals as *Phoca largha*, based on ecological features of the kill (degree of association with seasonal ice) (Appendix B, Table 9). Of the animals classified as *Phoca largha*, 15.3 percent (31 animals) were reported struck and lost, and 84.7 percent (170 animals) were harvested (Appendix B, Table 9). In Table 4, we also assumed the entire South Bristol Bay take of 71 animals was *Phoca vitulina*. Changing these assumptions will change the total statewide take estimate up or down. As stated above, we believe the best estimate of the subsistence take in 2005 is 1,696 harbor seals, based on the assumptions above.

Geographic Distribution of Harbor Seal Takes

Table 5 shows the regional distribution of harbor seal takes by Alaska Natives in 2005. The largest takes in absolute numbers were by the Tlingit and Haida of the Southeast region. About 37.4 percent (634 animals) of the statewide take of harbor seals were taken by hunters in Southeast Alaska (Table 5). The regions ranked second and third were the North Pacific Rim (395 seals, or 23.3 percent of the statewide take) and Kodiak Island (316 seals, or 18.6 percent). The remainder of the statewide harbor seal take (351 animals, or 20.7 percent) was distributed among the other six regions.

The geographic distribution of harbor seal takes by community is shown in Table 6. Of the top ten communities (in absolute numbers of harbor seals taken in 2005), four were in the Southeast region, four in the North Pacific Rim region, and two in the Kodiak Island region. The ten top ranking communities were Yakutat (164 seals), Tatitlek (155 seals), Ouzinkie (146 seals), Port Lions (77 seals), Ketchikan (73 seals), Port Graham (72 seals), Valdez (69 seals), Cordova (66 seals), Hoonah (64 seals), and Angoon (64 seals). There were nine communities with no reported harbor seals taken in 2005 – Aleknagik, Chignik Bay, Chignik Lagoon, King Salmon, Klukwan, Pilot Point, Seward, St. George, and St. Paul (spotted seals were reported taken at Aleknagik and Clark’s Point, and the harvest program at St. Paul did not collect harbor seal data).

Per capita harvests are the numbers of harbor seals harvested per Alaska Native living in a community. It is an estimate of the amount harvested per person in an area, controlling for differences in population size. The top ten communities in terms of harvests per capita in 2005 were Tatitlek (1.51 seals harvested per person), Karluk (.75), Ouzinkie (.69), Atka (.56), Port Lions (.47), Port Graham (.42), Yakutat (.37), Pelican (.25), Nikolski (.22), and Perryville (.20). There was greater parity across regions in per capita harvests compared with total community take (Table 6). Among the top ten communities for per capita harvests, three were in the Kodiak Islands, two each in the

Aleutian Islands, North Pacific Rim, and Southeast Region, and one in the South Alaska Peninsula.

Seasonal Distribution of Harbor Seal Takes

The seasonal distribution of the statewide harbor seal take in 2005 is depicted in Figs. 4 and 5. Seals were taken during all months in 2005. Since 1992, the seasonal patterning of harbor seal takes commonly has shown two distinct hunting peaks, one during spring and a second during fall-early winter, and a low point in June (Fig. 5). This general pattern was repeated during 2005, with the early peak occurring in March and second peak of productive hunting from September to December (Fig. 4). Overall, harbor seal hunting during 2005 was toward the low range for each month compared with other years. Harbor seal takes in April, October, and November were the lowest recorded for those months since surveys began in 1992. The fewest seals were taken during February, April, and June. Seasonal hunting patterns of each region and community are shown in the tables and figures of Appendices B and C.

Age and Sex Composition of Harbor Seal Harvests

The estimated age and sex composition of the 2005 harbor seal harvests are shown in Tables 7 and 8 by geographic region. Hunters reported harvesting male harbor seals over female harbor seals by a ratio of about 2.5 to 1 (776 males to 313 females of harvests with reported sex). Hunters also reported harvesting substantially more adult harbor seals (76.6 percent) than juveniles (19.2 percent) or pups (4.2 percent). Overall, adult females (237 animals) comprised about 21.8 percent of the total harbor seal harvest whose age and sex was reported in 2005. Hunters did not report the

sex for 25.9 percent of the harvest or the age for about 10.9 percent of the harvest. The age and sex are also unknown for animals that were struck and lost. A further analysis of age and sex composition is found in the Discussion section.

Hunter Assessments of Harbor Seal Population Trends

During 2000 and 2004, surveyed households were asked to make subjective assessments of harbor seal population trends in their hunting areas. Households were asked, “compared to five years ago, has the harbor seal population where members of your household have hunted ‘increased,’ ‘remained stable,’ ‘declined,’ ‘do not know,’ or ‘not applicable (do not hunt)’?” It is useful to display these subjective assessments of local population trends, comparing 2000 with 1995, and comparing 2004 with 1999 (see Table 9). Responses of ‘do not know’ or ‘not applicable (do not hunt)’ are removed in this analysis.

In almost all regions, a portion of households reported that local harbor seal populations had “increased,” “remained stable,” or “declined.” Comparing 2004 with 1999, a majority of hunters reported “increased” seal populations in Kodiak Island (52.9%), South Bristol Bay (54.2%), and Upper Kenai-Cook Inlet (57.1%). “Stable” seal populations was the most common assessment in all other regions, except for the Aleutian Islands where half of the hunters reported that populations “declined.” Notable shifts in hunter assessments of trends between the two comparison periods are apparent for the North Pacific Rim (from 60.0 percent “declined” to 60.7 percent “stable”), Kodiak Island (from 18.7 percent “increased” to 52.9 percent “increased”), Southeast (from 10.1 percent “declined” to 28.5 percent “declined”), and South Alaska Peninsula (from 55.8 percent “declined” to 69.2 percent “stable”). Overall, based on hunter assessments of recent trends, harbor seal populations in most regions were primarily judged to be “stable” or “increased,” except for the Aleutian Islands, where seal populations were assessed as “stable” or “declined.”

THE SUBSISTENCE TAKE OF SEA LIONS IN 2005

Estimated Size of the Sea Lion Take, 2005

The estimated size of the total take of Steller sea lions by Alaska Natives in 2005 is presented in Tables 10 and 11. In 2005, there were an estimated 218 sea lions taken by Alaska Natives for subsistence uses (with a 95 percent confidence range of between 169 to 301 animals) (Table 10). Of the 2005 subsistence take, 25.5 percent (56 sea lions) were struck and lost, and 74.5 percent (162 sea lions) were harvested.

Geographic Distribution of Sea Lion Takes

Table 11 shows the regional distribution of sea lion takes in 2005 by Alaska Natives. In 2005, the takes were split among four main regions – the Aleutian Islands (88 sea lions, or 40.5 percent of the total statewide take of sea lions), the North Pacific Rim (49 sea lions, or 22.6 percent), the Pribilof Islands (32 sea lions, or 14.7 percent), and Kodiak Island (25 sea lions, or 11.5 percent). Other regions harvesting sea lions were the Southeast region (19 sea lions, 8.7 percent) and South Alaska Peninsula (4 sea lions, 1.9 percent) (Table 11).

The geographic distribution of sea lion takes by community is shown in Table 12. In 2005, 15 of 62 surveyed communities reported harvesting sea lions. Nine communities had takes of five or more sea lions in 2005. Six more communities reported a take of less than five sea lions each. The six top ranking communities were Atka (61 sea lions), Tatitlek (48 sea lions), Old Harbor (21 sea lions), St. Paul (18 sea lions), Unalaska (17 sea lions), and St. George (14 sea lions). These seven communities accounted for 179 sea lions, or 82.2 percent of the total Alaska take.

Seasonal Distribution of Sea Lion Takes

The seasonal distribution of the sea lion take in 2005 is depicted in Figs. 4 and 6. Sea lions were reported killed during every month in 2005. Productivity was greatest in August (30.7 sea lions) and lowest in June (2.0 sea lions). The monthly productivity of sea lion hunting in 2005 showed a mid-range of productivity compared with recent years. Overall, productivity was substantially poorer compared with the period 1992 through 1996. The declines of productivity during both the spring and fall periods are particularly notable in Fig. 6. Seasonal hunting patterns of regions and communities are depicted in the tables and figures of Appendices B and C.

Age and Sex Composition of Sea Lion Harvests

The reported age and sex compositions of the 2005 sea lion harvests are shown in Tables 13 and 14. Hunters reported harvesting male over female sea lions by a ratio of about 2.1 to 1 (86.4 males to 41.8 females of animals with sex reported), below the previous five-year average of 3.1 to 1 (Fig. 26). In 2005, hunters reported taking more adult sea lions (95.6 adults, 67.0 percent of the take with age reported) than juvenile sea lions (44.1 juveniles, 30.9 percent) and sea lion pups (3.0 pups, 2.1 percent). From 1992 to 1995, juvenile harvests outnumbered adult harvests by at least 2 to 1 – 2.3 juveniles to one adult (1992), 1.9 (1993), 2.2 (1994), and 2.0 (1995). Since 1996, the ratio of juveniles to adults has decreased substantially – 1.0 juveniles to one adult (1996), 1.4 (1997), 0.7 (1998), 1.0 (2000), 0.9 (2001). Juvenile sea lion harvests were substantially less than adult harvests for the first time in 2002 (0.5 to one), followed by ratios of 0.5 (2003), 0.7 (2004), and 0.5 (2005). Adult females (24 animals) comprised about 20.5 percent of the total harvest of sea lions of known age and sex in 2005. Hunters did not report the sex for 20.9 percent of the harvest or the age for about

12.0 percent of the harvest. The age and sex also are unknown for sea lions that were struck and lost by surveyed hunters.

Hunter Assessments of Sea Lion Population Trends

During 2000 and 2004, surveyed households were asked to make subjective assessments of sea lion population trends in their hunting areas. Households were asked, "compared to five years ago, has the sea lion population where members of your household have hunted -- 'increased,' 'remained stable,' 'declined,' 'do not know,' or 'not applicable (do not hunt)'?" It is useful to show these subjective assessments of population trends, comparing 2000 with 1995, and comparing 2004 with 1999 (see Table 15). Responses of 'do not know' or 'not applicable (do not hunt)' are removed in this analysis.

Comparing 2000 with 1995, a majority of households in all regions reported that local sea lion populations had "declined" in household hunting areas. These subjective assessments of population trends had substantially changed by 2004 in three regions. Comparing 2004 with 1999, a majority of hunters judged sea lions populations to be "increased" or "stable" in the Southeast, North Pacific Rim, and Kodiak Island regions. In these three regions, 16.7 percent or less of hunters reported sea lion populations had "declined" comparing 2004 with 1999. By contrast, in the South Alaska Peninsula, 66.7 percent of hunters reported sea lion populations had "declined" comparing 2004 with 1999, similar to the assessment comparing 2000 with 1995 (63.6 percent of hunters reported "declined"). In the Aleutian Islands, half of surveyed hunters assessed that sea lion populations had "declined" comparing 2004 with 1999, while half assessed populations as "stable."

HUNTING PARTICIPATION AND EFFORT

In calendar year 2005, about 517 households hunted harbor seals and 68 households hunted sea lions (Table 16). Since 1992, there has been a substantial decline in the numbers of hunters for harbor seals and for sea lions (Fig. 8). Based on survey findings, the estimated numbers of households that reported at least one member hunting harbor seals were 1,014 (1992), 854 (1993), 971 (1994), 805 (1995), 859 (1996), 738 (1997), 707 (1998), 745 (2000), 575 (2001), 600 (2002), 564 (2003), and 535 (2004). The estimated numbers of households that reported at least one member hunting sea lions were 199 (1992), 222 (1993), 210 (1994), 158 (1995), 130 (1996), 97 (1997), 111 (1998), 86 (2000), 98 (2001), 90 (2002), 97 (2003), and 68 (2004).

The percentage of hunting households that reported hunting unsuccessfully for harbor seals in 2005 was 12 percent, compared with 29 percent (1992), 25 percent (1993), 37 percent (1994), 26 percent (1995), 28 percent (1996), 20 percent (1997), 14 percent (1998), 17 percent (2000), 14 percent (2001), 17 percent (2002), 20 percent (2003), and 15 percent (2004). Therefore, seal hunter success rates have slightly improved while the absolute number of hunters has fallen. The percentage of unsuccessful hunting households for sea lions was 18 percent in 2005, compared with 30 percent (1992), 35 percent (1993), 40 percent (1994), 24 percent (1995), 35 percent (1997), 23 percent (1997), 33 percent (1998), 25 percent (2000), 21 percent (2001), 29 percent (2002), 22 percent (2003), and 24 percent (2004).

In the 2000 survey cycle, surveyed households were asked to make a subjective assessment of their hunting effort in 2000 compared with five years before. Households were asked, “compared to five years ago, does harbor seal hunting now take your household – ‘more time and effort,’ ‘about the same time and effort,’ ‘less time and effort,’ ‘hunted then but now stopped,’ or ‘not applicable (no hunting last five years)’?” A

similar question was asked for sea lion hunting. This information is useful to display here, although it pertains to the year 2000 compared with 1995-1999. The subjective assessments for hunting households are shown in Tables 17 and 18 (responses of households not hunting during the previous five years are removed in this analysis).

In all regions, a portion of hunting households reported “more,” the “same,” or “less” time and effort in hunting harbor seals in 2000 (Table 17). In the Southeast region, where most harbor seals are taken, about 54.7 percent reported taking the “same time and effort” for hunting seals, while 30.2 percent reported taking “less time and effort.” Only 8.7 percent of households reported taking “more time and effort” compared with the prior five years. By contrast, larger percentages of households reported taking “more time and effort” in seal hunting in the Aleutian Islands (42.6 percent), North Pacific Rim (33.7 percent), and Kodiak Island (29.5 percent). In the North Pacific Rim and Kodiak Island regions, a substantial percentage of households reported that they had stopped hunting harbor seals sometime during the prior five years – 17.4 percent (North Pacific Rim) and 20.0 percent (Kodiak Island).

Table 18 shows the subjective assessments of sea lion hunting time and effort by region. As with harbor seals, in all regions some households reported “more,” the “same,” or “less” time and effort in hunting sea lions in 2000 compared with 1995-1999. More than half of the households reported taking “more time and effort” in hunting sea lions in the Aleutian Islands (67.3 percent) and the Kodiak Islands (55.3 percent). In the North Pacific Rim, 44.7 percent reported taking the “same time and effort” and 28.9 percent reported “less time and effort.” A relatively large percentage of households reported that they had stopped hunting sea lions during the prior five years in the South Alaska Peninsula (37.5 percent) and Kodiak Island (21.1 percent).

Total Take, Sea Lions, 1992 - 2005

Hunting harbor seals or sea lions is a relatively specialized subsistence activity in Alaska communities. The large majority of Native households in the study's sampling universe did not attempt to hunt harbor seals or sea lions. In 2005, 73 percent of surveyed households did not hunt harbor seals and 96 percent did not hunt sea lions. Among hunters, there also was substantial specialization in productivity (see Fig. 7). A relatively small core of highly-productive hunters reported taking most of the subsistence kills during 2005, similar to previous years. About 30 percent of the hunters reported taking about 72 percent of all harbor seals and sea lions (Fig. 7). Highly-productive hunters commonly distributed marine mammal products to other households through non-commercial networks of sharing and trade.

DISCUSSION

Somewhat different trends characterize the subsistence takes of harbor seals and sea lions since 1992. At the state level, subsistence takes of harbor seals have been declining since about 1995, while subsistence takes of sea lions have leveled off after declining substantially during the early 1990s. The following section discusses trends in more detail for each species, examining total take, age of harvest, and sex of harvest broken out by region.

Harbor Seal Subsistence Trends, 1992-2005

At the state level, subsistence takes of harbor seals have been declining since about 1995 (when 2,742 seals were taken) to a low in 2005 (1,698 seals), the lowest take since surveys began in 1992 (Table 4, Fig. 9). Comparing consecutive paired survey years since 1992, harbor seal takes have declined eight of the years, increased three years, and remained unchanged one year (Fig. 24). This indicates a declining

trend in the annual subsistence takes of harbor seals in Alaska. The total take of harbor seals in 2005 (1,698 seals) was 40.6 percent lower than takes in 1992 (2,854 seals) and 6.9 percent lower than takes in 2004 (1,822 seals) (Fig. 24). In terms of seasons, the decreasing takes of harbor seals have been occurring across all the major hunting periods (spring and fall-early winter) (see Fig. 5).

Harbor seal populations in Alaska are divided into three stocks for biological assessment – the Southeast Alaska stock, Gulf of Alaska stock, and Bering Sea stock. Harbor seal takes from the three stocks are shown in Figure 11. Total annual takes from the Southeast Alaska stock showed an overall decline of 61.9 percent from 1992 to 2005 (from 1,666 to 634 seals). Takes from the Gulf of Alaska stock in 2005 (958 seals) was about 1.3 percent higher than the take in 1992 (946 seals), rebounding from a low of 688 seals taken in 2002. Takes from the Bering Sea stock have declined from 243 seals in 1992 to 104 seals in 2005, a decrease of about 57.2 percent. Regional takes are shown in Figure 12. Annual harbor seal takes show the clearest downward trend in Southeast Alaska. While harbor seal takes in the other regions also appear to be in a downward direction, the trends are less clear than for the Southeast region.

The reasons for declining harbor seal takes are uncertain. Overall, it appears that the decline in harbor seal harvests is associated with fewer seal hunters on a statewide basis (Fig. 8, Table 16). Between-year fluctuations in harvests at the community level are influenced in part by local conditions such as food needs, prey availability, and personal circumstances of hunters. A closer examination of trends in some selected communities (Hoonah, Nanwalek, Old Harbor, Sitka, Tatitlek, and Yakutat) allows for us to see the interplay of factors like numbers of hunters, hunting success, and harvest rates in particular locations (Figs. 14-19). For example, at Hoonah and Yakutat, two major harbor seal hunting communities (Fig. 14-15), there have been fewer hunters and lower harvest rates per successful hunter in recent years, resulting in declining numbers of seals harvested. At Sitka (Fig. 16) we find fewer harbor seal

hunters, but relatively stable harvest rates per successful hunter in recent years, except for substantially lower numbers of hunters and success rates in 2005. As shown in Fig. 17, seal hunting at Tatitlek rebounded after 2002, which saw the lowest numbers of hunters, harvest rates, and seal harvests since the start of surveys in 1992. At Old Harbor, harvests and hunters in 2005 were at their lowest points since 1992 (Fig. 19). No clear trends are evident in the harvests, hunters, and harvest rates at Nanwalek (Fig. 18). These case communities suggest that a complex of local factors are influencing harvest patterns at the local level.

For harvests in two regions -- the North Pacific Rim and Kodiak Island -- a longer time series is available, shown as Figures 20 and 22 (struck and lost numbers are not available prior to 1992, so these figures compare only harvest numbers). In the North Pacific Rim, subsistence harvests of harbor seals have been substantially lower during the most recent ten-year survey period compared with harvests recorded prior to 1989, the year of the *Exxon Valdez* oil spill (Fig. 20). Families in Prince William Sound reduced their subsistence activities the year of the spill because of the uncertainties of the health safety of consuming wild foods harvested from oiled areas. Subsistence harvest levels showed signs of some recovery since the spill, particularly in Nanwalek and Port Graham along Lower Cook Inlet. The 2005 survey at Tatitlek (138 seals) in Prince William Sound recorded a rebound from 2002, the poorest seal harvest on record in this community (13 seals). By contrast, Chenega Bay reported its lowest seal harvest (5 seals) in 2005. For Kodiak Island villages, the 294 seals harvested in 2005 were substantially fewer than those recorded a decade before (478 seals in 1982)

Fig. 32. Adult and Juvenile Harbor Seal Harvests by Month, January 1992 - December 2005, North Pacific Rim Region

(Fig. 22). In this area, harbor seal harvests appear to have been in decline during the 1980s, followed by increases again during the 1990s at Old Harbor and Ouzinkie. In other Kodiak Island communities, harvests have remained low and variable during the 1990s.

The longer time series represented by the North Pacific Rim and Kodiak Island areas provide a cautionary note about interpreting trends in subsistence patterns described since 1992, the start of the most recent survey series. Reported harbor seal harvests were substantially higher a decade earlier in the North Pacific Rim and Kodiak Island areas. The pattern of use documented for 1992-2005 in those areas may represent observations at relatively low points of longer-term harvest cycles. The longer time series above may better represent the potential ranges of subsistence takes in these areas. Should conditions return to those during the 1980s, subsistence harvests of harbor seals might increase as well.

In contrast with the declining takes of harbor seals from 1992-2005, there has been remarkable consistency in the reported age and sex composition of the statewide harbor seal harvest. Figures 26 and 27 compare statewide patterns in the age and sex composition of the subsistence harvests of harbor seals since 1992. At the statewide level, hunters consistently have reported harvesting more male than female harbor seals each year. Considering kills of known sex, male to female sex ratios have been similar across survey years for harbor seals – 2.2 males to 1 female (1992), 2.4 (1993), 2.0 (1994), 2.1 (1995), 2.0 (1996), 2.0 (1997), 2.4 (1998), 2.6 (2000), 2.4 (2001), 2.6 (2002), 2.2 (2003), 2.4 (2004), and 2.5 (2005) (Fig. 26). At the statewide level, age composition also is similar between years (Fig. 27): hunters continued to report harvesting primarily adult harbor seals (from 77 to 85 percent of the annual harvest), with smaller proportions of juvenile seals (10 to 22 percent) and pups (1 to 5 percent).

Figures 28 and 29 compare age and sex compositions of harbor seal harvests at the regional level. There is considerable similarity between regions and years for harbor

seal sex composition (Fig. 28). Counting harvested animals whose sex was reported between 1992-2005, all regions showed more male seals to female seals harvested – Southeast (68 percent males), North Pacific Rim (70 percent males), Kodiak Island (74 percent males), South Alaska Peninsula (78 percent males), Aleutian Islands (70 percent males), and North and South Bristol Bay (72 percent males). A number of factors probably contribute to the predominance of males over females in the subsistence harvest of harbor seals across regions and years, as discussed in Wolfe and Mishler (1998). The higher number of males harvested likely reflects the greater availability of males in the groups of animals hunted due to two factors – sex segregation in seal groups, and female seals being more elusive than male seals when disturbed in a group, presenting comparatively fewer or more difficult targets (see Wolfe and Mishler 1998:60-61; Wolfe et al 1999).

The age composition of the subsistence harvest of harbor seals varies substantially between regions and presents a more complex picture than sex ratios (Fig. 29). Since 1992, hunters have been asked to classify the seal harvest into three categories – “pups,” “juveniles,” and “adults.” Probably most hunters answer this question using size and behavior as main indicators, so that the smallest seals with their mothers are classified as “pups,” small-sized seals are classified as “juveniles,” and medium-to-large seals are classified as “adults.” The hunters’ category of “juveniles” probably primarily includes yearlings (6 - 17.9 months), which are about 30 percent of adult weight, and perhaps include some 2-year-old seals (18 - 29.9 months) and 3-year-old seals (30 - 41.9 months), which have gained on average about 50 percent of adult weight (Bigg 1969: 21; Pitcher and Caulkins 1979:30).

Based on hunter reports, the percentages of juveniles in the harvest differed substantially between regions during 1992-2005 (Fig. 29). Of all the seals harvested during 1992-2005 in the Southeast Region, only 9 percent were reported to be juvenile seals. Bristol Bay seal harvests also had a relatively low juvenile composition of 15

percent juvenile seals. Other regions had substantially greater proportions of juvenile seals in their annual harvests, including South Alaska Peninsula (21 percent), North Pacific Rim (27 percent), Kodiak Islands (26 percent), and the Aleutian Islands (41 percent). These age patterns possibly reflect differences in the age compositions of seal populations accessible to hunters, perhaps due to different population structures in each region. The older ages of harvested seals in the Southeast region may reflect relatively larger and more stable seal populations with proportionately larger older age classes in the population, while the younger ages of seals harvested in other regions may reflect populations which are rebuilding, with proportionately larger young age classes.

As shown in Fig. 29, the reported age compositions of the seal harvests have seen substantial between-year changes for some regions. In 1998 and 2000, the proportions of juvenile seals fell substantially in the Kodiak Islands (to 12 percent and 13 percent) and the South Alaska Peninsula (to 11 percent and 4 percent). In both areas, the lower juvenile proportions resembled those of the Southeast and Bristol Bay regions. In the North Pacific Rim and Aleutian Islands, the juvenile proportions fell markedly in 1998, but rose again in 2000 to the relatively higher levels of previous years.

The reasons for these dramatic single-year changes in age composition are not known. If the age composition of the harvest reflects the age structures of local seal populations, which is speculation at this time, then at least two potential explanations present themselves. One interpretation might be that low juvenile harvests on particular years may reflect a relatively low production of young seals in a region during spring and summer. If this is the case, the juvenile proportion in the annual harvest may be an index of annual biological productivity of a local population. However, a second interpretation of the age composition data may relate the juvenile proportion to aging cohorts. A relatively high production of young seals during a particular year may create a relatively large cohort of young seals on a particular year. In another year or two, harvested seals from this aging cohort will likely be classified primarily as “adults” by

hunters. Under this second interpretation, a decrease of juveniles on a particular year may be due to a greater number of available new adults in a local population rather than due to a change in the production of young seals.

It is beyond the scope of this research to test for the likelihood of these or other potential explanations. However, the changes in age composition over time in three regions are illustrated in Figures 30 to 32, which present adult and juvenile harbor seal harvests by month from January 1992 through December 2005 for the Southeast, Kodiak Island, and North Pacific Rim regions (no data are available for 1999). This time series does not arbitrarily divide years between December 31 and January 1, as in Fig. 29, but allows for a combination of the calendar years to better visualize trends. A comparison of the Southeast harvest (Fig. 30) with the Kodiak harvest (Fig. 31) clearly illustrates the difference in the proportion of juveniles in the harvests – in Southeast Alaska juveniles are a relatively low part of the harvest compared with Kodiak Island where as many juveniles are taken as adults on some years. The Kodiak Island harvest time series (Fig. 31) shows that, compared with other years, there were lower juvenile harvests relative to adults in July 1996 through June 1997 as well as November 1997 through December 1998 and January 2000 through December 2000. By contrast, in the neighboring North Pacific Rim (see Fig. 31), juvenile harvests were high relative to adults in July 1996 through 1997, low from January 1998 through December, and high from January through October 2000. In the Southeast series, the proportion of juveniles increased during 2000, 2001, 2003, 2004, and 2005 (see Fig. 29). Such complex patterning of the age composition of harbor seal harvests may be related to annual changes in seal productivity and age class structures in local seal populations.

Fig. 33. Sea Lion Hunters and Success Rates, Atka, 1992 - 2005

Fig. 34. Sea Lion Hunters and Success Rates, Old Harbor, 1992 - 2005

Fig. 35. Sea Lion Hunters and Success Rates, Akutan, 1992 - 2005

Fig. 36. Sea Lion Hunters and Success Rates, Nanwalek, 1992 - 2005

Sea Lion Subsistence Trends, 1992-2005

Total subsistence takes of sea lions by Alaska Natives sharply declined from 1992 to 1995, with takes leveling off between 1996 to 2005 (Fig 10). The lowest recorded sea lion takes (164 animals) occurred in 1997. The subsistence take of 218 sea lions in 2005 was 40 percent of the subsistence take in 1992 (549 animals).

At the regional level, notable declines in sea lion takes have been reported by hunters from the Pribilof Islands (see Fig. 13), where total sea lion takes fell from 297 animals (1992) to 32 animals (2005), a decline of 89 percent. The sea lion take in the Aleutian Islands area increased to 88 animals in 2005 from a low of 37 animals in 1998, but was below the 135 animals taken in 1992. In Kodiak Island areas, the sea lion take in 2005 (25 animals) represented a 57 percent decrease from 1992 (58 animals) (Fig. 13).

In the North Pacific Rim and Kodiak Island regions, longer time series are available (see Figs. 21 and 23). Documented sea lion harvests in Tatitlek and Chenega Bay ranged as high as 27 animals in each place during the 1980s. In 2005, no sea lions were reported harvested in Chenega Bay, while 39 were harvested at Tatitlek, a new high (Fig. 21). Harvests at Nanwalek and Port Graham show substantial yearly variation (between one and nineteen animals). Only one sea lion was harvested between the two communities in 2005. On Kodiak Island, sea lion harvests declined substantially during the 1980s – 232 (1982), 202 (1986) and 37 (1989) – but rebounded again to 126 in 1995 because of increased harvests at Old Harbor and Ouzinkie. Kodiak Island harvests were 22 sea lions in 2005, with none reported for four of six villages (Fig. 23). The longer time series indicate that sea lion harvests have been declining in the North Pacific Rim and Kodiak Island areas, with the declines commencing during the 1980s for Kodiak Island communities.

Declines in sea lion takes documented over the last seven years appear to be associated with drops in hunter numbers, as illustrated in Fig. 8. Sea lion hunters fell

from a five-year average of 184 hunters (1992-96) to 68 hunters (2005). Successful sea lion hunters fell from a five-year average of 123 hunters (1992-96) to 56 hunters (2005). However, the success rate of those hunters (82 percent) was an all time high (Table 16). As with seal hunting, there are probably a variety of local factors related to the year-to-year changes in the number of households hunting sea lions in particular communities, including seasonal hunting conditions, local food needs, and personal circumstances of hunters.

Figure 33 illustrates trends at Atka, one of the few communities in the state reporting increased sea lion harvests in recent years. As shown in Fig. 33, the numbers of households hunting sea lions at Atka increased from 8 to 19 households from 1992 to 2003, and the numbers of households successfully harvesting sea lions increased from 6 to 18 households. Hunting households then fell to 9 households in 2005. Success rates for households show no clear trends: since 1992, annual mean harvests per household have ranged from 2.0 to 7.1 sea lions per successful hunter at Atka. Recent sea lion harvests of 51 animals in 2004 and 55 animals in 2005 were greater than the five-year average of 28 animals reported during 1994-1998.

Hunting patterns at Old Harbor display somewhat different trends (Fig. 34). At Old Harbor, there were increasing numbers of households hunting sea lions from 1992 to 1995 (from 21 households to 43 households), followed by a decrease to 12 households by 1997. In 2005 there were 8 successful sea lion hunters at Old Harbor, harvesting 18 animals. The harvest rate (2.4 animals per successful hunter in 2005) was toward the higher end of previous ranges (1.0 to 2.6 animals).

At Akutan, the numbers of households successfully harvesting sea lions have ranged between two and seven since 1992 (Fig. 35). Mean harvests per successful hunter have ranged from 1.0 to 5.5 sea lions. Sea lion harvests in 2005 (5 animals) and success rates (1.0 animals per successful hunter) were toward the lower range of recent years. At Nanwalek, the numbers of households successfully harvesting sea lions have

ranged between one and five since 1992 (Fig. 36). Mean harvests per successful hunter have ranged from 1.0 to 2.5 sea lions. In 2005, sea lion harvests (one animal) and success rates (1.0 animal per successful hunter) were in the low range at Nanwalek.

Declines in the numbers of sea lion hunters occurred at a time when sea lions became increasingly harder to find in local hunting areas and consequently more difficult and expensive to hunt. As shown in Table 18, 67.3 percent of the Aleutian Island hunters and 55.3 percent of Kodiak Island hunters reported taking “more time and effort” in hunting sea lions in 2000 compared with 1995-1999. As sea lions became scarcer in a community’s hunting area, a number of hunters in the community chose to stop hunting them. The hunters that continued to hunt appear to maintain annual harvest rates similar to past years, but the hunters must invest more time and effort in pursuit of the sea lions harvested.

In addition to these factors, it is quite likely that some sea lion hunters chose to reduce their hunting activity because of perceived problems with sea lion populations. Hunters commonly are astute observers of the condition and health of local sea lion stocks. Some portion of the decline in hunting effort during the early-to-mid 1990s probably reflected hunters choosing not to hunt in order to help conserve sea lion populations. The constrictive effects of these factors on sea lion harvests appear to have played out. After 1997, the numbers of sea lion hunters and sea lion takes have leveled off. During the most recent five survey years, the numbers of successful sea lion hunters have shown more consistency, ranging between 56 and 78 hunters. Similarly, sea lion takes during the most recent five survey years have ranged between 185 and 218 animals, with the high end of this range occurring in the most recent survey year. All together, the information from surveyed hunters indicates a stabilization and perhaps even a slight increase in the takes of sea lions over the last several years for the state as a whole.

APPENDIX A
SURVEY INSTRUMENT USED
IN HOUSEHOLD INTERVIEWS, 2005

The Subsistence Harvest of Harbor Seals and Sea Lions by Alaska Natives in 2005, by Robert J. Wolfe, James A. Fall and Ronald T. Stanek. Technical Paper No. 319, Alaska Department of Fish and Game, Division of Subsistence, Juneau, November 2005. Final Report For Year Thirteen, The Subsistence Harvest of Sea Lions and Harbor Seals by Alaska Natives, Harvest Assessment Program, 2005 (No. NA17FX2835), National Marine Fisheries Service.

HARBOR SEAL

2005 MARINE MAMMAL SURVEY

Are any members of your household Alaska Natives? Yes () No () If No, thank you for your cooperation. This survey is relevant to Native households.

If yes, how many people lived in your household in 2005? ()

Checking box: CHECK IF APPROPRIATE No Contact ()

Hunting location: If you hunted outside your region, where did you hunt? ()

DID YOUR HOUSEHOLD HUNT/USE SEA LIONS IN 2005? Yes () No ()

Thank you | Yes | No | Go to Sealion form

IF YES TO HARBOR SEALS, COMPLETE THE FOLLOWING QUESTIONS:

	Yes	No
1. Use harbor seals (meat, hides, or oil)?		
2. Hunt harbor seals?		
3. Kill and retrieve harbor seals?		
4. Receive harbor seals from other households or communities?		
5. Give away harbor seals to other households or communities?		

IF YES TO QUESTION 2 OR 3 ABOVE, GO TO QUESTION 6. IF NO, COMPLETE SEA LION SURVEY.

6. How many harbor seals did your household kill and retrieve? [Enter the numbers by month.]

7. In which months were they killed and retrieved? How many in (January, etc.)? [Enter the numbers by month.]

8. Of the harbor seals killed and retrieved in (January, etc.), how many were male, female, and how many were pups, juveniles, or adults?

[Enter the numbers by month.]

HARBOR SEAL	JANUARY	FEBRUARY	MARCH	APRIL	MAY	JUNE	JULY	AUGUST	SEPTEMBER	OCTOBER	NOVEMBER	DECEMBER	UNKNOWN	TOTAL

SEA LION

2005 MARINE MAMMAL SURVEY

DID YOU OR MEMBERS OF YOUR HOUSEHOLD HUNT OR USE SEA LIONS IN 2005? YES _____ NO _____
 (IF YES, PLEASE COMPLETE THE FOLLOWING QUESTIONS.) (IF NO, THAT COMPLETES THIS SURVEY. THANK YOU.)

During 2005, did you or your household:

1. Use sea lions (meat, hides, or oil)?
2. Hunt sea lions?
3. Kill and retrieve sea lions?
4. Receive sea lions from other households or communities?
5. Give away sea lions to other households or communities?

	Yes	No
1. Use sea lions (meat, hides, or oil)?		
2. Hunt sea lions?		
3. Kill and retrieve sea lions?		
4. Receive sea lions from other households or communities?		
5. Give away sea lions to other households or communities?		

IF YES TO QUESTION 2 OR 3 ABOVE, GO TO QUESTION 6. IF NO, THIS COMPLETES THE SURVEY. THANK YOU FOR YOUR COOPERATION.

6. How many sea lions did your household kill and retrieve? [Enter total number in box.] _____
7. In which months were they killed and retrieved? How many in (January, etc.)? [Enter the numbers by month.] _____

SEA LIONS	JANUARY	FEBRUARY	MARCH	APRIL	MAY	JUNE	JULY	AUGUST	SEPTEMBER	OCTOBER	NOVEMBER	DECEMBER	UNKNOWN	TOTAL

APPENDIX C

SUBSISTENCE TAKES OF HARBOR SEAL AND SEA LION BY COMMUNITY

SOUTHEAST ALASKA

1-2	Angoon
3-4	Craig
5-6	Haines
7-8	Hoonah
9-10	Hydaburg
11-12	Juneau
13-14	Kake
15-16	Ketchikan
17-18	Klawock
19-20	Klukwan
21-22	Pelican
23-24	Petersburg
25-26	Saxman
27-28	Sitka
29-30	Wrangell
31-32	Yakutat

NORTH PACIFIC RIM

33-34	Chenega Bay
35-36	Cordova
37-38	Nanwalek
39-40	Port Graham
41-42	Seldovia
43-44	Seward
45-46	Tatitlek
47-48	Valdez

UPPER KENAI-COOK INLET

49-50	Anchorage
51-52	Homer
53-54	Kenai
55-56	Tyonek

KODIAK ISLAND

57-58	Akhiok
59-60	Karluk
61-62	Kodiak City
63-64	Larsen Bay
65-66	Old Harbor
67-68	Ouzinkie
69-70	Port Lions

SOUTH ALASKA PENINSULA

71-72	Chignik Bay
73-74	Chignik Lagoon
75-76	Chignik Lake
77-78	False Pass
79-80	Ivanof Bay
81-82	King Cove
83-84	Perryville
85-86	Sand Point

ALEUTIAN ISLANDS

87-88	Adak
89-90	Akutan
91-92	Atka
93-94	Nikolski
95-96	Unalaska

PRIBILOF ISLANDS

97-98	St. George
99-100	St. Paul

SOUTH BRISTOL BAY

101-102	Egegik
103-104	King Salmon
105-106	Levelock
107-108	Naknek
109-110	Pilot Point
111-112	Port Heiden
113-114	South Naknek

NORTH BRISTOL BAY

115-116	Aleknagik
117-118	Clark's Point
119-120	Dillingham
121-122	Manokotak
123-124	Togiak
125-126	Twin Hills
