## Symbols and Abbreviations

The following symbols and abbreviations, and others approved for the Système International d'Unités (SI), are used without definition in the following reports by the Divisions of Sport Fish and of Commercial Fisheries: Fishery Manuscripts, Fishery Data Series Reports, Fishery Management Reports, and Special Publications. All others, including deviations from definitions listed below, are noted in the text at first mention, as well as in the titles or footnotes of tables, and in figure or figure captions.

| Weights and measures (metric) |  | General |  | Mathematics, statistics |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

March 2014

The Fishery Management Reports series was established in 1989 by the Division of Sport Fish for the publication of an overview of management activities and goals in a specific geographic area, and became a joint divisional series in 2004 with the Division of Commercial Fisheries. Fishery Management Reports are intended for fishery and other technical professionals, as well as lay persons. Fishery Management Reports are available through the Alaska State Library and on the Internet: http://www.adfg.alaska.gov/sf/publications/. This publication has undergone regional peer review.

#### Abstract

This report is summarizes the 2013 season and historical data concerning management of the commercial salmon fisheries of the Northwestern and Northern districts of the North Alaska Peninsula in the Alaska Peninsula Management Area (Area M). Most commercial salmon fishing effort on the North Alaska Peninsula targeted sockeye salmon Oncorhynchus nerka. The 2013 commercial salmon harvest on the North Alaska Peninsula was 571 Chinook O. tshawytscha, 721,336 sockeye, 27,452 coho O. kisutch, 5,281 pink O. gorbuscha, and 130,939 chum O. keta salmon. Chinook salmon harvest was the lowest reported since 1962, with the majority occurring in the Nelson Lagoon Section. The sockeye salmon harvest in the Northern District of 697,238 fish was below the 2003-2012 average harvest of $2,049,017$ fish and the lowest harvest on record since 1977. Of the Northern District harvest, 64\% (447,523 fish) were harvested in the sections between Port Moller Bight and Outer Port Heiden. The chum salmon harvest of 130,939 fish was below the ten-year average of 152,822 fish, with about $66 \%$ ( 86,382 fish) of the harvest occurring in the Northwestern District. Approximately 48\% of chum salmon harvested in the Northern District were caught in the Black Hills Section, the rest were caught incidentally during sockeye salmon fisheries in other sections. Nearly all Northwestern District chum salmon harvest came from directed fisheries.

Total sockeye salmon escapement for North Alaska Peninsula streams was 1,010,400 fish, similar to the 2003-2012 average of $1,081,421$ fish. Approximately $76 \%$ of the sockeye salmon escapement occurred in the Northern District's four systems in which sockeye salmon escapements are enumerated with weirs (Nelson, Bear, Sandy, and Ilnik rivers).

At the 2013February/March Board of Fisheries meeting, new regulations in the Northern District were adopted for the conservation of the Bear and Nelson rivers sockeye salmon stocks as well as the Ugashik River (Area T) sockeye salmon stocks. The 2013 commercial fishing season was the first year these regulation changes were implemented.

Key words: North Alaska Peninsula, Area M, Northern District, Northwestern District, commercial fisheries, annual management report, AMR, salmon harvest, salmon escapement, SEG, BEG, Chinook salmon, Oncorhynchus tshawytscha, sockeye salmon, Oncorhynchus nerka, coho salmon, Oncorhynchus kisutch, pink salmon, Oncorhynchus gorbuscha, chum salmon, Oncorhynchus keta

## INTRODUCTION

The purpose of this report is to document catch and escapement data, and to provide commercial salmon fishermen, buyers, and the Alaska Board of Fisheries (BOF) a context with which to compare the 2013 North Alaska Peninsula commercial salmon catch and escapement with historical information.

## GEOGRAPHY

## North Alaska Peninsula

The North Alaska Peninsula portion of the Alaska Peninsula Management Area (Area M) includes those waters of the Alaska Peninsula from Cape Sarichef to Cape Menshikof and consists of two districts: the Northwestern District, which includes all waters between Cape Sarichef and Moffet Point, and the Northern District, which includes all waters between Moffet Point and Cape Menshikof (Figure 1). The Nelson Lagoon to Outer Port Heiden region, which encompasses most of the Northern District, is the primary sockeye salmon Oncorhynchus nerka harvest area on the North Alaska Peninsula and includes the Nelson Lagoon, Bear River, Three Hills, Ilnik, and Outer Port Heiden sections (Figure 2). In addition to these sections, smaller directed commercial salmon fisheries occur in other areas of the North Alaska Peninsula.

## Alaska Peninsula and Bristol Bay Salmon Overlap Area

The Alaska Peninsula Area (Area M) and Bristol Bay Area (Area T) overlap area consists of the Cinder River Section, Inner Port Heiden Section, and Ilnik Lagoon (Figure 3; 5 AAC 39.120(d)). The overlap area was created shortly after statehood to allow Area T permit holders the
opportunity to fish within their traditional harvest locations of Area M. Historically, when not participating in the Bristol Bay sockeye salmon fisheries, Port Heiden Area T permit holders fished for Chinook O. tshawytscha and coho O. kisutch salmon in the Inner Port Heiden Section, and Pilot Point Area T permit holders fished inside the Cinder River Section for Chinook and coho salmon.
Since 1985, most of the effort in the Cinder River Section has been from Area T permit holders. Prior to 2013, Area T permit holders were allowed to fish during the open season in the Inner Port Heiden and Cinder River sections except during the month of July. In 2013, the Alaska Board of Fisheries (board) allowed Area T permit holders to fish in the Inner Port Heiden Section and in the inner portion of the Cinder River Section during all months of the commercial fishing season. Area T permit holders are also allowed to fish in Ilnik Lagoon during August and September. In 1986, Area T fishermen started fishing in the Ilnik and Outer Port Heiden sections. In 1990, the board excluded Area T permit holders from the Ilnik Section (except inside Ilnik Lagoon during August and September) and closed the Outer Port Heiden Section in August and September to all commercial salmon fishing by both Area M and Area T permit holders because of concern over potential interception of coho salmon bound for Inner Port Heiden (Meshik River).

## GEAR

Purse seine, hand purse seine, drift gillnet, and set gillnet are legal gear types in the Northwestern District (5 AAC 09.330(b)). In the Northern District, commercial salmon fishing is permitted with purse seine, drift gillnet, and set gillnet gear; however, within-section gear restrictions exist. For example, the Nelson Lagoon Section is open to drift and set gillnet gear only. In the Northern District drift gillnet is by far the most widely used gear. In the Northwestern District, use of purse seine gear equals or exceeds drift gillnet gear in some years.

## REGULATORY SEASON

The commercial salmon season opens in most of the Northwestern District on June 1 and in most of the Northern District on May 1 (5 AAC 09.310). The Three Hills Section may open to commercial salmon fishing on June 25. Fishing is allowed beginning June 20 in that portion of the Ilnik Section southwest of Unangashak Bluffs if sockeye salmon escapement meets or exceeds interim escapement objectives in the Ilnik River (Figure 2). In that portion of the Ilnik Section from Unangashak Bluffs to Strogonof Point, fishing is permitted beginning June 20 if escapement in the Meshik and Ilnik rivers meets or exceeds interim escapement objectives. A portion of the Outer Port Heiden Section may open to commercial salmon fishing beginning on June 20 if sockeye salmon escapement in the Meshik River is sufficient. Management action may also be taken in the Ilnik and Outer Port Heiden sections for conservation of Ugashik River sockeye salmon if that portion of the Egegik District specified in 5 AAC 06.359(c) is closed for the conservation of Ugashik River sockeye salmon in the Bristol Bay Management Area.

## Inseason Management

While the earliest opening dates are established by regulation and modified by emergency orders, actual fishing time in North Alaska Peninsula fisheries is based on inseason evaluation of local stock abundance and escapement objectives. Sockeye salmon are the primary species targeted for harvest, and Nelson and Bear rivers are the largest sockeye salmon producing systems. Between June 1 and September 15, within the Nelson Lagoon to Port Heiden region, management emphasis is on five sockeye salmon systems: Nelson, Bear, Sandy, Ilnik, and Meshik rivers
(Murphy and Wilburn 2013). Alaska Department of Fish and Game (ADF\&G) operates weir camps on the Nelson, Bear, Sandy, and Ilnik rivers that provide daily escapement counts used to manage commercial fisheries. Aerial surveys from a fixed wing aircraft are used to enumerate salmon in other systems that do not have weirs.
At the February/March 2013 Board of Fisheries meeting, the board adopted new regulations in the Northern District for the conservation of Bear and Nelson rivers sockeye salmon stocks as well as conservation of Bristol Bay sockeye salmon. ADF\&G will continue to manage the commercial fisheries in the Northern District based on the inseason evaluation of local stock abundance and escapement objectives; however from June 20 through July 31, ADF\&G will also manage the Bear, Three Hills, and Ilnik sections to allow passage of sockeye salmon from the northeast to the southwest of the Northern District. For management purposes, the three sections are separated into five areas; South Bear, North Bear, Three Hills, SW Ilnik and NE Ilnik (Figure 4). The waters in one of the five areas that are between the three-mile seaward boundary line, described in 5 AAC 09.301, and a line that is 1.5 nmi shoreward of the three-mile seaward boundary are closed for one 24 -hour period during a seven-day period. The waters located to the southwest of the open waters where a 24 -hour closure has occurred will have sequential closures that allow fishing in the waters only out to the one and one-half mile line, described in this subsection, for the first 24 hours of an open fishing period. Due to lengthy fishing closures in the Bear River, Three Hills, and Ilnik sections in 2013, these sequential closures were implemented for only one fishing period in each of the areas.
For the conservation of Bristol Bay sockeye salmon stocks, the Outer Port Heiden Section allowable fishing area was reduced to the baseline out to 1.5 nautical miles instead of three nauatical miles (5 AAC 09.350 (3)(A)). By regulation, these closed waters were in effect for the entire fishing season of the Outer Port Heiden Section.

## EsCAPEMENT GOALS

Weir counts and aerial surveys are used to estimate escapement. ${ }^{1}$ For rivers and river systems with established escapement goals, there are two types of goals used to characterize the run. As described in Honnold et al. (2007), a biological escapement goal (BEG) is used when the following conditions are met; 1) a sufficient time series of escapement and total return estimates are available, 2 ) contrast in the escapement data is sufficiently large, and 3) the estimates were sufficiently accurate and precise. Using these criteria, systems assigned a BEG are managed for escapements providing the greatest potential for maximum sustained yield. A sustainable escapement goal (SEG), on the other hand, is used when total return estimates are not available because harvest or age was not consistently measured. Methods used to develop SEGs include the percentile approach and risk analyses models (Sagalkin and Erikson 2013). As defined by the Sustainable Salmon Fisheries Policy (SSFP; 5 AAC 39.222), a SEG is a level of escapement indicated by an index or escapement estimate that is known to provide for sustained yield over a 5 to 10 year period. It is used in situations where a BEG cannot be estimated or managed for due to the absence of a stock specific catch estimate.

[^0]The commercial salmon fisheries on the North Alaska Peninsula are managed using escapement goals developed using the aforementioned criteria and methods. The inseason escapement at each system with an established goal determines how the fisheries are managed.

## Run Timing

The timing of sockeye salmon returning to North Alaska Peninsula streams varies by system and stock, but the majority of the sockeye salmon runs occur from early June to late July. Local sockeye salmon stocks are managed in the Nelson Lagoon to the Port Heiden region from June through September. The Nelson River sockeye salmon run begins in early June, peaks in early July, and is over by mid-August (Murphy and Hartill 2009). Bear River supports two distinct sockeye salmon runs. Bear River early run begins in early June, peaks in early July, and ends in late July. Bear River late run starts in late July, peaks in mid-August, and ends in September (Ramstad 1998). The Sandy, Ilnik, Meshik and Cinder rivers run timing closely parallels the Bear River early run, beginning in early June and ending in late July (Murphy and Hartill 2009). In 2013, North Peninsula sockeye salmon runs were 7-14 days earlier than usual.

## HARVEST BY SPECIES

## CHINOOK SALMON

The 2013 North Alaska Peninsula commercial Chinook salmon harvest of 571 fish was well below the most recent 10-year average (2003-2012) of 5,057 fish (Table 1). This was the lowest harvest on record from 1962-2012. Historically, the vast majority of Chinook salmon harvest occurred in the Northern District incidental to sockeye salmon fisheries, although periodically there were directed fisheries. In 2013, the Chinook salmon harvest of 346 fish in the Nelson Lagoon Section was below the 10-year average of 1,397 fish (Tables 2 and 3). The Bear River Section harvest of 55 Chinook salmon, occurred incidental to the sockeye salmon fisheries and was also below the 10 -year average of 1,725 fish (Tables 2 and 3). The Three Hills and Ilnik sections combined harvest of 75 Chinook salmon was also well below the 10 -year average of 1,378 fish (Tables 2 and 3). The Outer Port Heiden Section, which reopened in 2007 for the first time since 1989, had a harvest of 50 Chinook salmon. This was the lowest Chinook salmon harvest since the Outer Port Heiden Section reopened. There was no commercial fishing effort in the Inner Port Heiden Section in 2013 (Table 3).

## SOCKEYE SALMON

The 2013 North Alaska Peninsula sockeye salmon harvest of 721,336 fish (Table 1) was well below the most recent 10-year average harvest of $2,115,900$ as well as the 1993-2012 average harvest of 2,127,333 fish (Figure 5). The 2013 harvest was the lowest since 1977 (472,006 sockeye salmon) and was about $43 \%$ of the preseason projected harvest of $1,672,000$ sockeye salmon (Table 1; Eggers et. al 2013). The 2013 peak weekly harvest for sockeye salmon on the North Alaska Peninsula was from June 28 to July 4 (Table 2).

Most of the harvest occurred in the Northern District in the Nelson Lagoon, Bear River, Ilnik and Outer Port Heiden sections (Figure 1). The Nelson Lagoon sockeye salmon harvest in 2013 was 217,327 fish which was similar to the 10-year average harvest of 251,125 fish (Table 4). The Nelson Lagoon harvest made up approximately 31\% of the total North Alaska Peninsula sockeye salmon harvest. The combined Port Moller Bight, Bear River, Three Hills, and Ilnik sections total harvest was 192,607 sockeye salmon (Table 5) and the Outer Port Heiden Section had a
harvest of 254,916 fish (Table 4). The combined Port Moller Bight, Bear River, Three Hills, Ilnik and Outer Port Heiden sections accounted for approximately 62\% of the North Alaska Peninsula sockeye salmon harvest. Of that harvest, the Bear River Section had approximately 21\% (94,335 fish), the Three Hills Section had 4\% (16,983 fish), the Ilnik Section had 18\% ( 81,289 fish) and the Outer Port Heiden Section accounted for about 57\% (254,916 fish; Table 4). The proportion of harvest in the Bear River Section in 2013 was below the most recent 10year average (26\%). The Three Hills and Ilnik Sections were also below the 10-year averages of $6 \%$ and $44 \%$ respectively (Figure 6). The Outer Port Heiden Section proportion of harvest was above recent years however, it cannot be compared to a 10 -year average because commercial salmon fishing was recently permitted in this section beginning in 2007. There was no commercial effort to harvest sockeye salmon in the Port Moller Bight Section in 2013 despite openings concurrent with the Bear River Section.

## Coho Salmon

The 2013 North Alaska Peninsula coho salmon harvest of 27,452 fish was well below the 20032012 average harvest of 63,053 fish (Tables 1 and 6). Approximately 79\% (21,734 fish) of the coho salmon harvest came from the Nelson Lagoon Section. The remaining Northern District sections had approximately $20 \%$ of the coho salmon harvest (5,693 fish) and the final $1 \%$ ( 25 fish) was harvested in the Northwestern District (Table 6). The Nelson Lagoon Section typically has the highest coho salmon harvest, followed by either the Bear River or Ilnik sections.

## PINK SALMON

The 2013 North Alaska Peninsula pink salmon O. gorbuscha harvest of 5,281 fish was well below the 2003-2012 odd-year average harvest of 108,850 fish (Table 1). Pink salmon harvested in the Northern District are caught incidental to fisheries for other salmon species. The majority of the pink salmon harvest in 2013 occurred in the Northwestern District (3,123 fish) and was well below the 2003-2012 odd-year average harvest of 104,603 fish (Table 7).

## CHUM SALMON

The 2013 North Alaska Peninsula chum salmon O. keta harvest of 130,939 fish was below the 2003-2012 average harvest of 152,822 fish and well below the projected harvest of 224,000 fish (Table 1). In the Northern District, the harvest of 44,557 fish was below the 2003-2012 average of 62,177 fish (Table 8). The majority of the harvest in the Northern District was caught in the Black Hills Section (21,185 fish; Table 2) in July, due to area closures in the traditional sockeye salmon fishing areas at that time of year. The remainder of the chum salmon harvest in the Northern District occurred incidental to sockeye salmon fishing. The Northwestern District chum salmon harvest of 86,382 fish was also below the 10 -year average of 90,644 fish (Table 9). The majority of the chum salmon harvest in the Northwestern District occurred in the IzembekMoffet Bay section with 77,037 fish (Table 9).

## ESCAPEMENT BY SPECIES

## CHINOOK SALMON

The 2013 North Alaska Peninsula estimated total Chinook salmon escapement of 4,346 fish was well below the 2003-2012 average of 20,252 fish (Table 1). The 2013 Nelson River Chinook salmon escapement of 1,221 fish was below the BEG range of 2,400-4,400 fish (Sagalkin and

Erikson 2013; Table 10 and Appendix A1). Nelson River is the only river on the North Alaska Peninsula with a Chinook salmon escapement goal. The combined King Salmon, Bear, and Sandy rivers (Bear River Section) estimated Chinook salmon escapement was 725 fish, which was less than the 2003-2012 average of 2,642 fish (Table 3). The Bear River and Sandy River weir counts (Tables 11 and 12) do not accurately reflect the total escapement of Chinook salmon because most of the fish spawn below the weir sites or in other downstream tributaries. No Chinook salmon passed the Ilnik River weir in 2013 (Table 13). The Chinook salmon escapement of 375 fish into the Inner Port Heiden Section (the Meshik River and its tributaries) was below the 10 -year average of 6,240 fish (Table 3; Appendix A1). In the Cinder River Section, 1,100 Chinook salmon were documented, which was below the 2003-2012 average of 4,509 fish (Table 3; Appendix A1).

## SOCKEYE SALMON

The 2013 North Alaska Peninsula estimated total sockeye salmon escapement of 1,010,400 fish, which included weir and aerial survey counts, was similar to the 2003-2012 average estimated escapement of $1,081,421$ fish (Table 1; Figure 7). The combined North Alaska Peninsula escapement goal range is $531,400-1,023,800$ sockeye salmon for systems with established goals (Witteveen et al. 2009). The systems with an SEG are Christianson Lagoon (25,000-50,000 fish), Swanson Lagoon (6,000-16,000 fish), North Creek (4,400-8,800 fish), Bear River (early run 176,000-293,000 fish, late run 117,000-195,00 fish, or combined 293,000-488,000 fish), Sandy River ( $34,000-74,000$ fish), Ilnik River (40,000-60,000 fish), Meshik River (25,000100,000 fish), and Cinder River (12,000-48,000 fish; Witteveen et al. 2009). Nelson River is the only system on the North Alaska Peninsula with a BEG (97,000-219,000 fish; Sagalkin and Erikson 2013). The systems most often considered in management decisions and the historical escapements and goal ranges are detailed in Table 14. In 2013 two systems exceeded their escapement goals; Nelson River (248,000 sockeye salmon) and Cinder River (64,000 sockeye salmon; Appendix A1). In addition, two systems did not meet escapement goals; Christianson Lagoon (16,500 sockeye salmon) and Swanson Lagoon (3,000 sockeye salmon).

## Nelson River

In 2013, an estimated 263,000 sockeye salmon escaped into streams in the Nelson Lagoon Section (Table 4), of which 248,000 fish returned to Nelson River, 9,000 to Caribou River and 6,000 to David’s River (Appendix A1). The Nelson River weir sockeye salmon escapement of 248,000 fish exceeded the escapement goal of 97,000-219,000 sockeye salmon and was above the current 10-year average of 212,051 fish (Tables 14 and 15; Sagalkin and Erikson 2013). The peak daily escapement ( 16,671 fish) at the Nelson River weir occurred on June 26 (Table 15).
Nelson River is the only North Alaska Peninsula river that has a female sockeye salmon escapement objective. In some years, high numbers of female sockeye salmon have been harvested, reducing the quality of escapement. To account for this, the proportion of female sockeye salmon passing the weir is determined through weekly sampling. That proportion is then extrapolated to account for the entire day's escapement. When the weir was removed on July 25, it was estimated that about 101,000 female sockeye salmon had passed the weir, within the management escapement objective of 50,000-110,000 female fish (Murphy and Wilburn 2013).

## Bear River

The Bear River early and late sockeye salmon runs have separate escapement goals because both are recognized as distinct components of the run. In 2013, the Bear River early-run was within the escapement goal range of $176,000-293,000$ fish, with an escapement of 219,074 sockeye salmon (Table 16). The late-run (after July 31) slightly exceeded the escapement goal of 117,000-195,000 fish, with an escapement of 196,926 sockeye salmon. The largest daily escapement at the weir in 2013 occurred on August 9 when 17,769 sockeye salmon were counted (Table 17).

## Sandy River

The total 2013 Sandy River sockeye salmon estimated escapement of 42,000 fish was within the escapement goal range of $34,000-74,000$ fish, and similar to the 2003-2012 average escapement of 46,150 fish (Tables 14 and 18; Sagalkin and Erikson 2013). The largest daily escapement at the Sandy River weir occurred on July 6 when 2,923 sockeye salmon were counted (Table 18).

## Ilnik River

The Ocean River, a major spawning tributary that accounts for approximately $20 \%$ of the spawning sockeye salmon run in the Ilnik system, periodically empties directly into the Bering Sea instead of the Ilnik River. When this occurs, as it did in 2013, Ocean River-bound salmon can bypass the Ilnik River weir. To account for the Ocean River-bound sockeye salmon that bypass the weir, the Ilnik River escapement goal (40,000-60,000 fish) is decreased by $20 \%$ to $32,000-48,000$ sockeye salmon. The remaining $8,000-12,000$ fish (or $20 \%$ ) is the historical proportion of the Ocean River component of the Ilnik system (Murphy and Wilburn 2013).
In 2013, the sockeye salmon escapement for the Ilnik River system (including Ocean River and Willie Creek, a tributary to Ilnik River) was 51,000 fish (Appendix A1). The weir counts and post-weir estimates on Ilnik River (31,000 fish; Table 19) reflect the total escapement numbers for Ilnik River and Willie Creek bound sockeye salmon. The Ilnik River escapement (including Willie Creek) of 31,000 fish was just below the escapement goal range of $32,000-48,000$ sockeye salmon. The final sockeye salmon escapement into Ocean River ( 20,000 fish) was determined by aerial surveys and exceeded the Ocean River sockeye salmon escapement goal of 8,000-12,000 fish. The total 2013 Ilnik River system escapement (including Ocean River) of 51,000 sockeye salmon met the combined Ilnik River and Ocean River escapement goal of 40,000-60,000 fish, yet was below the 2003-2012 average escapement of 75,930 fish (Tables 4 and 14).

## Port Heiden

Escapement into Meshik River and its tributaries are determined by aerial surveys. In 2013, 85,800 sockeye salmon were documented in the Meshik River (including Red Bluff Creek) meeting the escapement goal of 25,000-100,000 fish (Appendix A1; Sagalkin and Erikson 2013). This was slightly below the 10 -year average of 90,246 fish (Table 14). Because there was no directed harvest on Meshik River fish prior to 2007, the escapement goal was routinely exceeded. Since 2007, when the Outer Port Heiden Section reopened, escapements into Inner Port Heiden have decreased and have been closer to the escapement goal.

## Coho SALmon

Nelson and Ilnik rivers are the only rivers on the North Alaska Peninsula that have a coho salmon lower-bound SEG. At Nelson River the peak escapement estimate of 22,000 coho salmon (determined by aerial surveys) exceeded the goal of 18,000 fish (Appendix A1; Sagalkin and Erikson 2013). The peak escapement estimate of 13,000 coho salmon for the Ilnik River system (including tributaries) also exceeded the goal of 9,000 fish (Appendix A1; Sagalkin and Erikson 2013). Some of the larger estimated escapements occurred in the Bear River (4,000 fish), Meshik River (21,000 fish), Mud Creek (4,000 fish) and Cinder River (12,000 fish; Appendix A1). A lack of escapement information for coho salmon in the Northwestern District is due to poor survey conditions during the early portion of the coho salmon runs and to the departure of management staff from the Alaska Peninsula prior to peak coho salmon runs.
In all, approximately 100,075 coho salmon were documented by aerial surveys in 23 North Alaska Peninsula streams during 2013 (Appendix A1). It should be noted that due to budget constraints most completed surveys occurred prior to the peak of the coho salmon run.

## PINK SALMON

Odd-numbered year pink salmon escapements are typically smaller than even-numbered year escapements on the Alaska Peninsula. The 2013 North Alaska Peninsula estimated total pink salmon escapement of 8,183 fish was well below the 2003-2012 odd-year average of 45,271 fish (Table 1; Appendix A1). The majority of the pink salmon escapement occurred in the Northwestern District ( 7,100 fish), which was below the most recent odd-numbered year average escapement of 20,418 pink salmon (Table 7; Appendix A1).

## CHUM SALMON

The North Alaska Peninsula has two aggregated chum salmon escapement goals, one for the entire Northern District and one for the entire Northwestern District. In 2013, the Northern District chum salmon escapement of 137,251 fish met the goal of 119,600-239,200 fish (Table 8; Appendix A1; Sagalkin and Erikson 2013). Historically the Herendeen-Moller Bay Section has the largest chum salmon runs in the Northern District. In 2013, Herendeen and Moller bays accounted for about 32\% of the total Northern District chum salmon escapement (43,600 fish; Table 8). The remaining chum salmon escapement in the Northern District is shown in Table 8. The Northwestern District chum salmon escapement of 92,800 fish did not meet the goal of 100,000-215,000 fish, and was well below the previous 10-year average of 194,999 fish (Table 9; Sagalkin and Erikson 2013). The total North Alaska Peninsula estimated chum salmon escapement of 230,051 fish was well below the 2003-2012 average of 385,814 fish (Table 1).

## COMMERCIAL SALMON FISHERY SUMMARY, 2013

The majority of the North Alaska Peninsula commercial fishing effort targeting sockeye salmon occurred in the Nelson Lagoon, Bear River, Three Hills, Ilnik, and Outer Port Heiden sections in the Northern District. The total Northern District sockeye salmon harvest of 697,238 fish was well below the 2003-2012 average of 2,049,017 fish. Of those sections, all total sockeye salmon runs (catch and escapement combined) were below the most recent 10-year averages (Table 4). However, because the Outer Port Heiden Section was closed from 1990 to 2007, that harvest information is only a six-year average (2007-2012). Although most of the commercial fishing effort targets sockeye or coho salmon in the Northern District, Chinook, chum and pink salmon
are also harvested (Table 2). A complete listing of all commercial salmon species harvested by day on the North Peninsula can be found in Table 20.

## NORTHWESTERN DISTRICT

Sockeye, chum and pink salmon were the main species harvested in the 2013 Northwestern District commercial salmon fishery, with incidental catches of coho and Chinook salmon (Table 21). The Northwestern District has few large sockeye salmon producing systems and receives less commercial fishing effort than the Northern District. The 2013 sockeye salmon harvest in the Northwestern District of 24,098 fish was below the 2003-2012 average harvest of 66,884 sockeye salmon (Table 22). A total of 26 permit holders harvested all of the Northwestern District sockeye salmon catch in the Izembek-Moffet Bay Section, with the majority of those fish harvested in the Moffet Bay area (20,169 fish; Table 2 and 21). The 2013 Izembek-Moffet Bay Section sockeye salmon harvest was below the 2003-2012 average harvest of 26,557 fish (Table 22).

The Northwestern District chum salmon harvest of 86,382 fish in 2013 was similar to the 10 -year average harvest of 90,644 fish (Table 9). The majority of the chum salmon harvest occurred in the Izembek-Moffet Bay Section (77,037 fish) followed by the Bechevin Bay Section (9,345 fish; Table 21). In 2013, poor survey conditions prevented ADF\&G from documenting the chum salmon escapement into streams in the Izembek-Moffet Bay Section. As a result, fishing time in the Izembek-Moffet Bay Section was restricted to three 42-hour openers. The first fishing period began on July 28 and the last period began August 12 (Table 23).

The pink salmon harvest of 3,123 fish was far below the 2003-2012 odd-year average of 104,603 fish, with the majority of the harvest occurring in the Bechevin Bay Section (2,958 fish; Table 7 and 21). Bechevin Bay Section was open by emergency order for three fishing periods for a total of 210 hours in 2013. Aerial surveys in 2013 did not document sufficient escapement to warrant a commercial fishing opener in the Urilia Bay and Swanson Lagoon sections which may open to commercial salmon fishing by emergency order only (Table 23).

## NORTHERN DISTRICT

## Black Hills Section

The Black Hills Section may open to commercial salmon fishing starting May 1 (5 AAC 09.310 (a)(10)). Typically, the drift gillnet fleet concentrate their efforts closer to Port Moller during the bulk of the sockeye salmon runs; however, there was more participation in the Black Hills Section than normal due to the long commercial fishing closures from Port Moller to the Outer Port Heiden area in the month of July. The commercial fishing fleet targeted both sockeye and chum salmon from early-July to the beginning of August. In 2013, 49 permit holders harvested 32,373 sockeye salmon and 21,185 chum salmon in the Black Hills Section (Table 2). The sockeye salmon harvest was above the 10 -year average of 21,512 fish (Table 4). The chum salmon harvest was also well above the 10 -year average of 12,967 fish (Table 8). The peak weekly harvest for sockeye salmon occurred from July 5 to July 11 (8,374 fish) and for chum salmon from July 26 to August 1 (5,475 fish; Table 2). North Creek is the only river in the Black Hills Section with a sockeye salmon escapement goal. The 2013 North Creek salmon escapement
of 8,500 sockeye salmon (determined by aerial surveys) was within the escapement goal of 4,400-8,800 fish (Appendix A1; Sagalkin and Erikson 2013).

## Nelson Lagoon Section

The Nelson Lagoon Section may open to commercial salmon fishing on May 1 (5 AAC 09.310 (a)(8)). Fishing times are based on the evaluation of the Nelson River sockeye salmon stocks from mid-June to mid-August (5 AAC 09.369 (e)(2)). The total Nelson River system run, consisting of the Nelson Lagoon Section harvest and escapements of all Nelson River tributaries, was 480,327 sockeye salmon (Table 4). A total of 34 permit holders harvested 217,327 sockeye salmon (Table 24) which was slightly less than the 2003-2012 average harvest of 251,125 fish (Table 4; Figure 8). During the 2013 commercial salmon fishing season, the Nelson Lagoon Section was open during most regularly scheduled weekly fishing periods throughout the season (Tables 23 and 24). The first day of salmon harvest in the Nelson Lagoon Section occurred on June 10 and the last day with a delivery was September 6. The peak daily catch was on June 27 when 27 permit holders harvested 17,250 sockeye salmon (Table 24). The largest weekly harvest in Nelson Lagoon occurred between June 21 and June 28 when 62,648 sockeye salmon were harvested (Table 2; Figure 9).

After August 15, the Nelson Lagoon Section was managed based on coho salmon run strength. The 2013 Nelson Lagoon coho salmon harvest of 21,734 fish was below the 2003-2012 average of 40,226 fish and represented about $79 \%$ of the total Northern District coho salmon harvest (Tables 6 and 21). In recent years, increased processor interest and higher prices for coho salmon have resulted in increased harvest effort. On September 6, the only on-shore processor in the area ceased buying operations.

## Bear River and Three Hills Sections

By regulation, the Bear River Section opens to commercial salmon fishing on May 1, while the Three Hills Section opens June 25 (5 AAC 09.310 (a)(4)(5)). Fishing times in the Bear River and Three Hills sections are based on the evaluation of the Bear, Sandy, and Ilnik river sockeye salmon stocks through June and July (Murphy and Wilburn 2013). The main emphasis is on
In 2013, management of the Bear River and Three Hills sections was greatly influenced by a weak sockeye salmon early-run in the Bear River. Due to low escapement counts at the Bear River weir, the Bear River and Three Hills sections, were closed on June 27. The Bear River sockeye salmon escapement in July tracked minimum escapement goals; however there was not a harvestable surplus of fish to warrant commercial fishing (Table 25). On August 4 and 5, test fisheries were conducted at the mouth of Bear River to assess if there was any marine build-up of sockeye salmon and the strength of the Bear River late-run which begins on August 1. The results of these test fisheries and large escapement counts over the previous several days indicated that there was likely a harvestable surplus of fish available (Tables 25 and 26). The Bear River and Three Hills sections reopened to commercial salmon fishing on August 7 with a buffer zone around the mouth of Bear River to allow escapement while providing some commercial salmon harvest opportunity.

Harvest in the Bear River Section occurred from June 10 to September 5. A total of 61 permit holders harvested 94,335 sockeye salmon which was well below the 2003-2012 average harvest of 509,035 fish (Tables 4 and 25). The largest weekly harvest in the Bear River Section of 26,763 sockeye salmon occurred between June 21 and June 27 (Table 2; Figure 10). The largest
daily harvest of 11,444 sockeye salmon occurred on June 26 (Table 25). The total late-run harvest of 100,485 sockeye salmon was well below the most recent 10 -year average of 307,335 fish while the late-run escapement (196,926 fish) was slightly above the most recent 10-year average of 160,580 fish (Table 16).
Harvest in the Three Hills Section occurred from June 25 until August 28. A total of 16,983 sockeye salmon were harvested by 27 permit holders (Tables 4 and 27). The 2013 sockeye salmon harvest was well below the most recent 10-year average of 116,398 fish. This can be attributed to an overall decrease in the average number of permits fished in the Three Hills Section (Figure 11), redistribution of the effort in the Northern District, and a reduction in fishing time due to inseason management actions implemented to protect local stocks.

## Ilnik Section

The Ilnik Section may open to commercial salmon fishing on June 20, depending on escapement levels in the Ilnik and Meshik rivers (5 AAC 09.369(j)(1)(A)). Management of the Ilnik Section northeast of Unangashak Bluffs is based on the Ilnik River weir escapement and Meshik River sockeye salmon escapement (as determined by aerial surveys). In that portion of the Ilnik Section southwest of Unangashak Bluffs, management actions are based on Ilnik River weir escapement levels and Ocean River escapement from June 20 to July 20. Between July 21 and August 15, the Ilnik Section is based on the abundance of Bear River sockeye salmon stocks (Murphy and Wilburn 2013).

The Ilnik Section outside of Ilnik Lagoon opened to commercial salmon fishing on June 28 (Table 23). At that time, the cumulative Ilnik River sockeye salmon escapement was 14,884 fish, meeting the June 30 interim escapement objective of 12,000-20,000 fish (Table 19). The Ilnik Section areas northeast and southwest of Unangashak Bluffs, were open concurrently during commercial fishing periods. Sockeye salmon escapement into Ilnik River tracked minimum interim escapement objectives throughout the season, however there appeared to be no harvestable surplus. As a result, the entire Ilnik Section was closed to commercial salmon fishing on June 30, to protect Ilnik River-bound sockeye salmon as well as other local stocks (Table 23). After the peak of the Ilnik run, the Ilnik section remained closed until August 7 to protect the Bear River sockeye salmon run that was also struggling to meet interim escapement objectives. A total of 95 permit holders harvested 81,289 sockeye salmon in the Ilnik Section. The first harvest in the Ilnik Section occurred on June 28 and the last delivery occurred on August 17 (Table 28). About $67 \%$ of the harvest ( 54,834 sockeye salmon) occurred southwest of Unangashak Bluffs (Southwest Ilnik), and $33 \%$ ( 26,455 sockeye salmon) was harvested between Unangashak Bluffs and Strogonof Point (Table 21; Figures 2 and 3). The 2013 peak daily catch was on June 29 when 35,819 sockeye salmon were harvested (Table 28).

After August 15, by regulation, the Ilnik Section is managed on the basis of coho salmon runs into Ilnik Lagoon and the abundance of the Bear River late-run sockeye salmon stock. Despite open commercial fishing periods, there was little fishing effort during this time period in the Ilnik Section due to inclement weather and the fleet focusing its effort on sockeye salmon in the Bear River Section. A total of 1,674 coho salmon were harvested in the Ilnik section, which was well below the 2003-2012 average of 7,179 fish (Table 6 and 28).

No commercial salmon fishing effort occurred inside Ilnik Lagoon in 2013 even though fishing time was permitted (Table 21).

## Outer Port Heiden Section

This was the seventh year a directed sockeye salmon fishery occurred in the Outer Port Heiden Section since the section reopened in 2007. In 2013 however, the fishing area in the Outer Port Heiden Section was reduced by one-half at the Board of Fisheries meeting in February/March. The 2013 commercial fishing season was the first season that harvest was allowed from the baseline out to 1.5 nautical miles instead of three nautical miles. By regulation, the Outer Port Heiden Section may open to commercial salmon fishing from June 20 through July 31. Fishing time in the Outer Port Heiden Section is based on Meshik River sockeye salmon abundance unless management actions are taken for the conservation of Ugashik River sockeye salmon in the Egegik District (Murphy and Wilburn 2013).

The weekly fishing period in the Outer Port Heiden Section allows 2.5 days of fishing time per week. In 2013, commercial salmon fishing opened in the Outer Port Heiden section on June 25 for the first 2.5 day fishing period. This schedule was followed through July 21 when the area closed for the duration of the 2013 season (Table 23). A total of 86 permit holders harvested 254,916 sockeye salmon from the Outer Port Heiden Section (Table 2 and 29). The peak daily catch was on July 4 when 76 permit holders harvested 71,466 sockeye salmon (Table 29). The largest weekly harvest of 105,778 sockeye salmon occurred during the period of June 21 to June 27 (Table 2; Figure 10). The number of permit holders fishing in the Outer Port Heiden Section in 2013 was well below the previous 5-year average (Figure 11), and the sockeye salmon harvest was the lowest since the section reopened in 2007 (Table 4).

## Inner Port Heiden and Cinder River Sections

There was no commercial fishing effort in the Inner Port Heiden Section in 2013. Confidentiality requirements prohibit the release of harvest information for the Cinder River section due to the minimal commercial fishing effort in this area. There was no effort by Area T permit holders in in these overlap areas in 2013 (Table 30).

## EMERGENCY ORDERS

In 2013, there were a total of 35 emergency orders issued concerning North Alaska Peninsula salmon fisheries (Table 23). The first emergency order for the North Alaska Peninsula was issued on June 16 and the last on September 4. Emergency orders for North Alaska Peninsula fisheries were issued from the regional Alaska Department of Fish and Game offices in Port Moller and Sand Point in 2013.

Note: Catch numbers do not include test fish harvest or fish retained for personal use. Total permit numbers reflect the total number of individual permits fished.
${ }^{\text {a }}$ There was no commercial salmon harvest effort.
${ }^{\text {b }}$ Confidentiality requirements prohibit reporting harvest.
c Totals include information not provided due to confidentiality requirements.
d The Caribou Flats Section: no open season.
e Fishery closed.

Note: Catch numbers do not include test fish harvest or fish retained for personal use.
a Outer Port Heiden Section catches occurred from 1986 to 1989 and 2007 to 2013. This section was closed between 1990 and 2006.
b Inner Port Heiden escapement includes Meshik River, Red and Yellow Bluff creeks and minimal escapements from Birthday Creek and Charles Creek.
c Escapement includes all sockeye salmon systems, mainly Bear and Sandy rivers combined with post weir estimates.
d Nelson Lagoon escapement includes tributaries David's and Caribour rivers.
e Escapements are determined by aerial surveys except for Bear, Sandy, Ilnik, and Nelson rivers where weir counts are used.
${ }^{\mathrm{f}}$ Three Hills Section harvest is included in the Ilnik Section harvest.
${ }^{\mathrm{g}}$ These figures are extrapolated estimates.
${ }^{h}$ Outer Port Heiden average catch includes 2007-2013, the years the section has been reopened.

Note: Catch numbers do not include test fish harvest or fish retained for personal use.
${ }^{\text {a }}$ Statistical area 311-58 was moved from the Bechevin Bay Section, to the Izembek-Moffet Bay Section in 2001.
b Catch numbers include a small harvest from the Dublin Bay Section in 1983, 2006, and 2011 only.
c Escapements are rounded estimates determined by aerial surveys.

a Does not include David or Caribou Rivers.
b Escapement is based on weir counts and post weir escapement estimates. Only those years when weirs were present are included in the table.
c From 2005-2010, 2012, and in 2013, the Ocean River did not flow into Ilnik Lagoon. For those years, the Ocean River escapements (determined by aerial surveys) have been added to the Ilnik River weir count. In 2013 the Ocean River escapement was 20,000 fish.
d Escapement is based on aerial surveys.
e Meshik River escapement includes Red and Yellow Bluff creeks (tributaries).
f Cinder River escapement includes Mud Creek (a tributary).

Note: Catch numbers do not include test fish harvest or fish retained for personal use.
a Statistical area 311-58 was moved from the Bechevin Bay Section, to the Izembek-Moffet Bay Section in 2001.
b In 1983 only the Northwestern District catch includes a small harvest from the Dublin Bay Section.
c Escapements are estimated totals.

Table 23.-Emergency order summary for the North Alaska Peninsula commercial salmon fishery, 2013.

| Emergency Order \# | Issued: | Effective: | Action Taken: |
| :---: | :---: | :---: | :---: |
| Port Moller-1 | $\begin{aligned} & \text { 8:00 p.m } \\ & \text { June } 16 \end{aligned}$ | 6:00 a.m. <br> June 17 | Closure: The Port Moller Bight and Bear River sections will remain closed to commercial fishing from 6:00 a.m. Monday, June 17 until further notice. |
| Port Moller- 2 | 8:00 p.m. <br> June 19 | $\begin{aligned} & \text { 12:01 a.m. } \\ & \text { June } 20 \end{aligned}$ | Closure: The Ilnik and Outer Port Heiden sections will remain closed to commercial salmon fishing from 12:01 a.m. Thursday, June 20 until further notice. <br> Fishing Period: The Inner Port Heiden Section will open to commercial salmon fishing from 6:00 a.m. Thursday, June 20 until 6:00 a.m. Friday, June 21. |
| Port Moller-3 | $\begin{aligned} & \text { 9:00 a.m. } \\ & \text { June } 20 \end{aligned}$ | $\begin{aligned} & \text { 11:59 p.m. } \\ & \text { June } 20 \end{aligned}$ | Fishing Period: The Nelson Lagoon Section will open to commercial salmon fishing from 11:59 p.m. Thursday, June 20 until 11:59 p.m. Friday, June 21. |
| Port Moller- 4 | $\begin{aligned} & \text { 8:00 p.m. } \\ & \text { June } 23 \end{aligned}$ | $\begin{aligned} & \text { 6:00 a.m. } \\ & \text { June } 25 \end{aligned}$ | Fishing Period: The Outer Port Heiden Section will open to commercial salmon fishing from 6:00 a.m. Tuesday, June 25 until 6:00 p.m. Thursday, June 27. That portion of the Outer Port Heiden section located from 3 nm to 1.5 nm from the beach is closed to commercial salmon season as per recent regulatory changes. |
|  |  |  | Fishing Period: The Thee Hills Section will open to commercial salmon fishing from 6:00 a.m. Tuesday, June 25 until 6:00 p.m. Thursday, June 27. That portion location from 3 nm to 1.5 nm from the beach will be closed to commercial salmon fishing for the first 24 hours of the fishing period: from 6:00 a.m. Tuesday, June 25 until 6:00 a.m. Wednesday, June 26. |
|  |  |  | Fishing Period: The Bear River Section will open to commercial salmon fishing from 6:00 a.m. Tuesday, June 25 until 6:00 p.m. Thursday, June 27. That portion of the Bear River Section located from 3 nm to 1.5 nm from the beach will be closed to commercial salmon fishing from 6:00 a.m. Wednesday, June 26 until 6:00 a.m. Thursday, June 27. That portion of the Bear River Section located southwest of Cape Kutuzof will be closed to commercial salmon fishing from 3 nm to 1.5 nm from 6:00 a.m. Thursday, June 27 until 6:00 p.m. Thursday, June 27. |

[^0]:    ${ }^{1}$ The Sustainable Salmon Fisheries Policy (5 AAC 39.222) defines escapement as the annual estimated size of the spawning salmon stock; quality of the escapement may be determined not only by numbers of spawners, but also by factors such as sex ratio, age composition, temporal entry into the system, and spatial distribution within the salmon spawning habitat.

[^1]:    -continued-

[^2]:    Note: Catch numbers do not include test fish harvest or fish retained for personal use.

[^3]:    Note: Catch numbers do not include test fish harvest or fish retained for personal use.

[^4]:    ${ }^{\text {a }}$ Post weir escapement estimates were determined using aerial surveys, commercial fishery performance, effort levels, and weather conditions to provide a reasonable estimate of escapement levels after weir was removed.

[^5]:    a Post weir escapement estimates were determined using aerial surveys to provide a reasonable estimate of escapement levels after weir was removed.

[^6]:    a Post weir escapement estimates were determined using aerial surveys to provide a reasonable estimate of escapement levels after weir was removed.

[^7]:    Note: Catch numbers do not include test fish harvest or fish retained for personal use.
    ${ }^{\text {a }}$ By regulation, the Nelson Lagoon Section may open to commercial salmon fishing on May 1.
    ${ }^{b}$ Fishery closed.
