and
Rodney D. Campbell

Regional Information Report¹ No. 4K93-30

Alaska Department of Fish and Game
Division of Commercial Fisheries
211 Mission Road
Kodiak, Alaska

November 1993

¹The Regional Information Report Series was established in 1987 to provide an informational access system for all unpublished divisional reports. These reports frequently serve diverse ad hoc informational purposes or archive basic uninterpreted data. To accommodate timely reporting of recently collected information, reports in this series undergo only limited internal review and may contain preliminary data; this information may be subsequently finalized and published in the formal literature. Consequently, these reports should not be cited without prior approval of the author or the Division of Commercial Fisheries.

AUTHORS

Arnold R. Shaul is the Alaska Peninsula and Aleutian Islands Management Areas Salmon Management Biologist for Region IV, Alaska Department of Fish and Game, Division of Commercial Fisheries, 211 Mission Road, Kodiak, Alaska, 99615.

James N. McCullough is the Alaska Peninsula and Aleutian Islands Management Areas Herring Biologist and Alaska Peninsula-Southeastern District Salmon Management Biologist for Region IV, Alaska Department of Fish and Game, Division of Commercial Fisheries, 211 Mission Road, Kodiak, Alaska, 99615.

Robert L. Murphy is the Alaska Peninsula Salmon Research Biologist and the North Alaska Peninsula Herendeen Bay to Strogonof Point Salmon Management Biologist for Region IV, Alaska Department of Fish and Game, Division of Commercial Fisheries, 211 Mission Road, Kodiak, Alaska, 99615.

Patrick B. Holmes is the Atka-Amlia Management Area Salmon Management Biologist for Region IV, Alaska Department of Fish and Game, Division of Commercial Fisheries, 211 Mission Road, Kodiak, Alaska, 99615

Robert S. Berceli is the Alaska Peninsula and Aleutian Islands Management Areas Assistant Salmon Management Biologist for Region IV, Alaska Department of Fish and Game, Division of Commercial Fisheries, 211 Mission Road, Kodiak, Alaska, 99615.

Rodney D. Campbell is the Alaska Peninsula and Aleutian Islands Management Areas Assistant Herring Biologist and Alaska Peninsula-Southeastern District Salmon Assistant Management Biologist for Region IV, Alaska Department of Fish and Game, Division of Commercial Fisheries, 211 Mission Road, Kodiak, Alaska, 99615.

ACKNOWLEDGMENTS

Mark E. Stopha was the Alaska Peninsula and Aleutian Islands Management Areas Assistant Herring Biologist and Alaska Peninsula-Southeastern District Salmon Assistant Management Biologist until August when he began graduate school. Seasonal employees Steve Krueger, Brian Westgate, Chris Sundby, Mark Weinberger, Dan Miller, Kenyon Pope, Jon Streifel, Shawna Rudio, Laura Ashford, Judy Brandt, Tim Clark, Dan Thomas, Kathy Hobart, Meesha Mangiaracina, Brenda Eliason, Judy Hamik, Matt Ford, Justin Freeman, Steve Reed, Moses Dirks, and Ronald Snigaroff collected and recorded data. Hal Terry and Randy Weber, ADF&G pilots, provided most of the aircraft support. Local air taxis utilized include Peninsula Airways and Kenai Floatplane Service. Chignik Management Area staff provided assistance in monitoring the Port Heiden and Cinder River stocks and compiled some of the data concerning the Alaska Peninsula Southeastern District fishery. The Department of Public Safety aircraft and personnel and vessel crews of the P/V Vigilant, Wolstad, and Trooper provided on grounds surveillance and transport of supplies and personnel. The M/V Resolution crew transported supplies. Sharon Thies provided office assistance in Kodiak. Pete Probasco, Larry Nicholson, and Bruce Barrett provided supervisory support and management coordination of fisheries.

LIST OF TABLES

<u>Table</u>	<u>Page</u>
1. Alaska Peninsula-Aleutian Islands salmon catches by year, for the South Peninsula, North Peninsula, Aleutian Islands, and Atka-Amlia areas, 1906-1992	44
2. Alaska Peninsula-Aleutian Islands salmon harvest, in number of fish, by statistical area, section, and district, 1992	52
3. Estimated value of 1992 commercial salmon fishery	57
4. Alaska Peninsula-Aleutian Islands Management Areas salmon catch by year, gear, species, and estimated value, 1979-1992	58
5. Processing companies purchasing salmon in the Alaska Peninsula, Aleutian Islands, and Atka-Amlia Islands Areas, 1992	61
6. Salmon catches in number of fish, by district and gear, 1992	62
7. Salmon catches in number of fish by species, permanent salmon week, and area, all gear combined, 1992	64
8. Units of gear used in the Alaska Peninsula Management Area, 1987-1992	70
9. Number of limited entry permits and fishing effort in the Alaska Peninsula Management Area, 1976-1992	72
10. North Peninsula salmon runs by species, 1962-1992	73
11. Northern District chinook salmon runs, 1962-1992	76
12. Northwestern District sockeye salmon runs, 1962-1992	78
13. Northern District sockeye salmon runs, 1962-1992	81
14. North Peninsula coho salmon catches by district and section, 1979-1992	83
15. Northwestern District pink salmon runs, 1962-1992	84
16. Northwestern District chum salmon runs, 1962-1992	87
17. Northern District chum salmon runs, 1962-1992	90
18. Nelson Lagoon salmon runs, 1960-1992	93

LIST OF TABLES (Cont.)

<u>Table</u>	<u>Page</u>
19. Daily Nelson Lagoon Section chinook salmon catches and number of permits fished, all gear combined, 1979-1992	94
20. Daily Port Heiden Section chinook salmon catches and number of permits fished, all gear combined, 1979-1992	97
21. Nelson Lagoon daily sockeye salmon catches, in number of fish, all gear combined, 1992	100
22. Nelson Lagoon daily coho salmon catches, in number of fish, all gear combined, 1992	101
23. Inner Port Heiden daily coho salmon catches, in number of fish, all gear combined, 1992	102
24. Cinder River daily coho salmon catches, in number of fish, all gear combined, 1992	103
25. Sockeye salmon daily and cumulative escapement counts through the Bear River weir, 1992	104
26. Chinook, pink, and chum salmon daily and cumulative escapement counts through the Bear River weir, 1992	107
27. Sockeye salmon daily and cumulative escapement counts through the Nelson River weir, 1992	109
28. Chinook, pink, and chum salmon daily and cumulative escapement counts through the Nelson River weir, 1992	111
29. Sockeye salmon daily and cumulative escapement counts through Ilnik River weir, 1992	112
30. Chinook, pink, and chum salmon daily and cumulative escapement counts through the Ilnik River weir, 1992	114
31. Salmon escapement survey counts in the North Peninsula, 1992	115
32. Peak and estimated total salmon escapement by district, species, and stream for the North Peninsula, 1992	124

LIST OF TABLES (Cont.)

<u>Table</u>	<u>Page</u>
33. Indexed total escapement of sockeye salmon in some North Peninsula systems, in thousands of fish, 1992	131
34. Indexed total escapement of chum salmon in some major North Peninsula production locations, in thousands of fish, 1992	133
35. Sapsuk River indexed total coho salmon escapements, 1979-1992	134
36. Sandy River estimated sockeye escapement age composition, in thousands of fish, 1979-1992	135
37. Bear River estimated sockeye escapement age composition, in thousands of fish, 1979-1992	136
38. Nelson (Sapsuk) River estimated sockeye escapement age composition, in thousands of fish, 1979-1992	137
39. Urilia Bay, Meshik River, Ilnik Lagoon, and Orzinski Lake sockeye escapement percent age composition, 1986-1992	138
40. South Peninsula salmon runs by species, 1962-1992	140
41. South Peninsula pink salmon runs, 1962-1992	143
42. South Peninsula chum salmon runs, 1962-1992	146
43. Salmon escapement survey counts in the South Peninsula, 1992	149
44. Peak and estimated total salmon escapement by district, species, and stream for the South Peninsula, 1992	169
45. South Peninsula sockeye indexed total escapements by section, 1962-1992	184
46. South Peninsula pink salmon indexed total escapements by section, 1962-1992	185
47. South Peninsula chum salmon indexed total escapements by section, 1962-1992	188
48. Shumagin Islands Section June test fish salmon catch, 1992	191

ALASKA PENINSULA, ALEUTIAN ISLANDS, AND ATKA-AMLIA SALMON

Introduction

The Alaska Peninsula, Aleutian Islands, and Atka-Amlia Management Areas are collectively referred to as Management Area M & F and are divided into four subareas: (1) the North Peninsula, consisting of Bering Sea waters extending west from Cape Menshikof to Cape Sarichef on Unimak Island; (2) the South Peninsula, consisting of Pacific Ocean coastal waters extending west of Kupreanof Point to Scotch Cap on Unimak Island; (3) the Aleutian Islands, exclusive of the Atka-Amlia Management Area, consists of the Aleutian Islands west of Unimak Island; and (4) the Atka-Amlia Management Area, consisting of Bering Sea and Pacific Ocean waters extending west of Seguam Pass (172°50' W. long.) and Atka Pass (175°23' W. long.) also known as Area F (Figures 1-16; Appendix A). Five species of Pacific salmon are harvested in the Alaska Peninsula Management Area: 1) chinook salmon *Oncorhynchus tshawytscha*, sockeye salmon *O. nerka*, chum salmon *O. keta*, 4) pink salmon *O. gorbuscha*, and coho salmon *O. kisutch*.

The Alaska Board of Fisheries (BOF), during the November 1991 meeting, created an experimental open-to-entry set gillnet salmon fishery around Atka and Amlia Islands. In addition to the set gillnet gear, fishers with CFEC Area M purse seine permits may seine for salmon in the Atka-Amlia Islands Area.

During January through June, Area T (Bristol Bay) salmon fishers are allowed to fish during the open season in the Inner Port Heiden and Cinder River Sections. During August through December Area T fishermen may commercially fish in the Inner Port Heiden and Cinder River Sections, and Ilnik Lagoon area.

The Dutch Harbor office assists with Aleutian Islands Management Area finfish responsibilities and a seasonal office in the village of Atka has the Atka-Amlia responsibilities. There are three headquarter offices in the Alaska Peninsula Management Area: Sand Point, Cold Bay, and Port Moller. In 1990, the Sand Point office assumed responsibility for managing salmon in the Southeastern District. In 1992, the Port Moller office assumed responsibility for managing salmon in the Herendeen-Moller Bay, Bear River, Three Hills, and Ilnik Sections. The balance of the Alaska Peninsula and Aleutian Islands Management Areas salmon fisheries are managed from the Cold Bay office. Port Moller also serves as the Alaska Peninsula salmon research office. The 1992 emergency orders are listed in Appendix B.

Currently, four weirs operate in the Alaska Peninsula Management Area; Bear, Nelson, Orzinski, and Ilnik Rivers. Orzinski (Orzenoi) and Ilnik have operated since 1990. Orzinski was weired during 1929-41 and 1990-92. Due to the importance of Orzinski sockeye in determining fishing time for the Northwest Stepovak Section, the amount of attention this area receives in regards to potential Chignik sockeye interception, and the difficulties involved with estimating fish from the air, it was decided to reinstall a weir in 1990. Orzinski is an easy system to weir. Unfortunately, the 450 foot long weir at Ilnik Lagoon (the longest weir in Alaska) is extremely difficult to install and maintain. It was decided to weir Ilnik due to the often poor conditions for estimating salmon from the air, and the importance of this system in determining fishing time for both the Ilnik Lagoon fishery (dominantly set gillnet gear) and a large drift gillnet fleet fishing outside the lagoon in the Ilnik Section. Unfortunately, there were too many problems in securing a fish tight weir in 1990 to obtain good escapement data. In 1991 and 1992, the weir was modified and escapement counts and samples were successfully obtained.

Salmon fisheries in the Alaska Peninsula Management Area date back to at least 1888 when canneries were reportedly constructed at Orzinski (Orzenoi) Bay and Thin Point Cove. However, the earliest catch records for the Alaska Peninsula Area date back to 1906. The first recorded Aleutian Islands Management Area commercial salmon catches were in 1911.

Early catches in the Alaska Peninsula were dominantly sockeye salmon with a few chinook and coho salmon. The first year in which pink and chum salmon catches exceeded 500,000 each was 1916. Area wide historical catches, 1992 section and area harvests, processor and economic value of the fishery, along with weekly harvest by gear and area and number of permit holders by gear are listed in Tables 1-9.

The South Peninsula interception fisheries include the South Unimak (False Pass) June fishery, the Shumagin Islands June fishery, the Southeastern District Mainland (Balboa-Stepovak or Stepovak) fishery, and early through mid-July South Peninsula cape fisheries (Eggers et al. 1991, McCullough 1990). During some years, substantial interception of Bristol Bay destined sockeye salmon occurs by North Peninsula fishermen between Cape Seniavin and Strogonof Point (Geiger 1989, Swanton and Murphy 1992).

There are about 582 salmon systems within the Alaska Peninsula, Aleutian Islands, and Atka-Amlia Management Areas (Murphy 1992). The South Peninsula has 185 salmon systems with sockeye salmon found in 23, pink salmon 110, chum salmon 72, and coho salmon in 57 systems, while the North Peninsula has 62 systems with chinook salmon present in 10 systems, sockeye salmon in 32, pink salmon in 11, chum salmon in 38, and coho salmon in 13 (Murphy 1992).

In the Aleutian Islands and Atka-Amlia Management Areas, there are at least 335 systems with sockeye salmon present in 45, pink salmon in 319, chum salmon in 11, and coho salmon in 35 (Murphy 1992).

Escapement estimates using two methods are presented: 1) indexed (Appendix D) and 2) expansion factors for chinook, sockeye, and coho salmon and the area-under-the-curve method (Johnson and Barrett 1988) for pink and chum salmon. The indexed method is used inseason and for historical trends while expansion factors and the area-under-the-curve method has been used for post season analysis since 1986.

NORTH PENINSULA

Introduction

The North Peninsula includes two districts; the Northwestern and Northern Districts. The Northwestern District extends from Cape Sarichef to Moffet Point while the Northern District extends from Moffet Point to Cape Menshikof (Figures 4 and 5).

Catch and escapement information regarding the North Peninsula salmon are presented in Tables 10-39.

North Peninsula sockeye salmon catches averaged 239,500 during 1962-1975, 669,600 during 1976-78, and 2,025,800 during 1979-92 (Tables 1-10). Catches during the 1962-92 period ranged from 172,000 in 1973 to 3,575,000 (record high) during 1992 (Tables 1-10).

Sockeye salmon are the dominant species along the North Peninsula. The major producing systems are Bear River, Nelson Lagoon, Meshik River, Sandy River, Ilnik, and Urilia Bay. Bear River is the top producer with Nelson Lagoon being second. In addition to those listed above, there are numerous smaller producing systems (Table 31). The 1992 indexed total escapement for the North Peninsula was 861,300 (Table 10).

Peak North Peninsula sockeye salmon catches are taken during the first 10 days of July. Most returns to the Northern District are complete by the end of July. However, Bear River's return has a second peak in August and lasts well into September. There is also a small sockeye salmon return in Nelson Lagoon during early August. These fish are believed to spawn in lakes (mainly tributaries of the David's River) along the west side of the Nelson Lagoon drainage. Some Northwestern District sockeye salmon runs also last into August.

The major chum salmon producing locations are the Izembek-Moffet Bay, Herendeen-Port Moller Bay, Bear River, and Bechevin Bay Sections (Table 7). The North Peninsula chum salmon runs usually begin in June and continue at a steady rate throughout July and early August. Nelson Lagoon's run, which can be occasionally strong, starts in late July and is of short duration. Trader's Cove and Warm Springs chum salmon returns occur during August through early September.

Chum salmon are usually the second most important North Peninsula salmon species. Catches have averaged 390,700 during 1979-92 and the average indexed total escapement for the same period was 430,000 salmon (Table 10). The record catch was 797,000 fish during 1984. The chum catch in 1992 was 341,600, while the chum escapement was 351,700 in 1992 (Table 10).

On the average, coho salmon are the third most important commercial salmon species on the North Peninsula, although coho salmon are more important than chum salmon during some years. Due to the late timing of the runs, virtually no fishing effort was directed towards North Peninsula coho salmon until 1948, and then only in limited locations. During recent years more stocks have been exploited. However, there are undoubtedly stocks on both sides of the Alaska Peninsula which have not been identified. Escapement information is very limited.

North Peninsula coho salmon catches averaged 33,500 fish per year from 1948 through 1978. The catch jumped dramatically to a 177,900 average between 1979-92, with catches ranging from 75,100 in 1983 to 238,000 in 1982 (Table 10). The 1992 coho harvest was 206,000 (Tables 7 and 10).

Nelson Lagoon is the largest North Peninsula coho salmon producer (Tables 7 and 22). Other major runs include Port Heiden (Table 23), Cinder River (Table 24), Ilnik (Table 7), and Swanson Lagoon (Table 31).

Coho salmon returns generally begin about August 1, peak during the last two weeks in August and the first week in September, and are essentially over by September 15. However, there are exceptions, for example, the Ocean River coho salmon run seems to peak during late September. There is a lot to be learned concerning North Peninsula coho salmon stocks. Escapement information is limited due to budget restraints.

Chinook salmon are the fourth ranked salmon species in commercial importance along the North Peninsula (Table 4). However, they are economically valuable to some individuals. Chinook salmon are one of the two most important species at Port Heiden (Table 7) and are an important

contributor to the Nelson Lagoon economy (Table 19). The record North Peninsula catch was 44,200 fish during 1916. The harvest averaged 20,100 fish during 1979 through 1988, ranging from 11,700 in 1986 to 30,100 during 1982 (Table 10). The 1989 through 1992 average chinook salmon harvest is 11,400 fish with the 1992 harvest of 13,100 (Table 10). The reason for the recent decline is unknown but does not appear related to parent year escapement size. Nelson Lagoon, Port Moller vicinity, and Port Heiden are the major North Peninsula chinook salmon producing locations (Table 7).

Chinook salmon runs begin during the last week in May, peak during mid and late June then gradually decline until they are essentially over in late July. Most spawning occurs during the first half of August.

On the average, pink salmon are the least important North Peninsula salmon (Table 4). Returns are quite small and value per fish is lower than the other species. However, Bechevin Bay has occasionally produced large pink salmon returns during even numbered years and there was an unusually large run in Herendeen Bay during 1990. The North Peninsula even year pink salmon harvest averaged 201,000 fish during 1978-1992, ranging from 12,300 in 1985 to 518,000 fish in 1990 (Table 1). The catches in 1978, 1980, 1990, and 1992 were the only harvests on record to exceed 65,000 (Table 1). The odd year harvest has averaged 3,000 during 1977-1991, ranging from 900 fish in 1977 to 11,200 in 1981 (Table 1). The 1992 indexed total escapement was 207,600 salmon (Table 10).

It is not known why the North Peninsula is not a much larger pink salmon producer. Some of the streams look like good producers and do occasionally receive large enough pink salmon escapements to produce a substantial return. However, the returns normally fail to build and there likely is a feature in the marine environment which is not conducive to good pink salmon survival. Bechevin Bay, which has produced much of the North Peninsula pink salmon harvest should possible be considered part of the South Peninsula.

Most escapement estimates in the text are indexed totals except Bear River and Sapsuk River sockeye salmon 1962-92, Sapsuk River chinook and chum salmon 1962-85, Orzinski (South Peninsula) sockeye salmon 1990-92, and Ilnik sockeye salmon 1991-92 which are tower or weir counts. The indexed totals are calculated from aerial surveys and are likely lower than the actual totals. Consequently there will be differences after 1984 between figures used in area management reports and those in formally published reports (technical data reports, bulletins, etc.) which use different expansion factors. The indexed totals continue to be used for historical purposes.

North Peninsula 1992 Summary

The 1992 North Peninsula sockeye salmon harvest of 3,575,112 was the largest on record, exceeding the 1985 harvest of 2.6 million sockeye salmon (Table 1). The majority of the harvest (87%) occurred within the Port Moller to Strogonof Point fisheries (3,098,472 salmon; Table 7). Escapement into North Peninsula systems was estimated at 861,300 salmon (Table 10), with most of the escapement occurring in Bear River (450,000; Table 25), Nelson River system (180,000; Table 27), and Ilnik River (45,000; Table 29). Escapement goals were reached or exceeded in all systems.

The Bear River Section is managed on the basis of Bear River sockeye escapement through the weir. All interim escapement goals for Bear River were met and additional fishing time was permitted to harvest surplus escapement. On July 4, the Bear River Section was open to the stream terminus at the ocean shoreline to more effectively control the escapement. Throughout the remainder of the 1992 season, Bear River was open to the mouth for all subsequent openings. The season harvest was 1,398,257 sockeye, with peak weekly harvest occurring during the week of June 28 - July 4 (209,061 sockeye) followed closely by the week of August 9 - August 15 (200,423 sockeye; Table 7). The peak daily catch occurred on August 10 (63,182 sockeye). Fifty-two percent of the Bear River Section harvest occurred post-July 15. Approximately 39% of the total 1992 North Peninsula harvest occurred in the Bear River Section. Overall, excellent escapement through the weir warranted significant fishing opportunity to harvest surplus escapement.

Like the Bear River Section, the Three Hills Section is managed on the basis of Bear River escapement. The Three Hills Section is scheduled to open by regulation on June 25 (ADF&G 1992). Adequate escapement into Bear River permitted extensive fishing opportunity in both the Bear River and Three Hills Sections. The 1992 sockeye catch in the Three Hills Section was 959,223, with the peak catch occurring during the week of June 28 - July 4 when 487,800 sockeye were harvested. The peak daily catch occurred on July 2 (104,507). Sockeye harvest in the Three Hills Section accounted for 27% of the total North Peninsula catch.

Prior to July 16, the Ilnik Section is managed on the basis of Ilnik River sockeye through the weir. Post July 15, the section is managed using Bear River stocks. However, if a conservation concern is found in either the Bear River or Ugashik River (Bristol Bay Management Area) prior to July 15, then time and area closures may be considered (Shaul and Murphy 1992). Based on migration timing between Ugashik and North Peninsula fisheries, the bulk of the Bristol Bay run during a normal year would be past North Peninsula fisheries by July 15. If the Ilnik, Bear, and

Ugashik Rivers runs are late, and escapement requirements are not being met, then an extension beyond July 15 may be needed to ensure escapements.

The portion of the Ilnik Section from Three Hills to Unangashak Bluffs was scheduled to open to commercial salmon fishing on July 5. However, inside Ilnik Lagoon, which is predominantly a small set gillnet fishery, was open to commercial salmon fishing prior to July 5 (ADF&G 1992). The first commercial opening outside Ilnik Lagoon occurred from July 6 through July 8 in which about 510,000 sockeye were harvested in the 2.5 day opening. At this time, Ilnik River escapement began to lag slightly, and Ugashik River escapement appeared to be considerably later than usual. Based on these two circumstances, the Ilnik Section was closed in order to achieve escapement objectives. The next opening in the Ilnik Section, which included the entire Ilnik Section to Strogonof Point, which is scheduled to open on July 15 (ADF&G 1992), was on July 15 shortly after the Ilnik and Ugashik River escapement objectives were met or exceeded. The season catch in the Ilnik Section, including Ilnik Lagoon was 740,992 sockeye (Table 7), which represented 21% of the North Peninsula catch. The peak weekly harvest in this section of 513,439 sockeye occurred during July 5 - July 11.

The Nelson Lagoon sockeye harvest was 378,706 salmon. This was the third largest harvest since at least 1960 (Table 18). The peak harvest of 99,545 sockeye salmon occurred during the week of July 5 - 11, with a harvest of 85,888 sockeye salmon occurred during the following week of July 12 - 18 (Table 7).

The Urilia Bay sockeye harvest was 40,920 salmon (Table 7) and the indexed total escapement estimate was 30,900 fish. Although the number of sockeye in the escapement was within the goal of 26,400 to 52,800, the timing appeared late. The early and mid-June harvest in 1992 was weak in comparison to late June and early July. It appears that early fishing followed by late June and early July closures in previous years, has changed run timing. To rebuild the early segment of the run, closure of the fishery during most of June or until observed escapement warrants fishing, should be implemented in subsequent years.

The North Peninsula chum harvest was 341,616 salmon (Table 1). Major harvest locations were Herendeen Bay (127,323 salmon), Bear River Section (62,229 salmon), and the Izembek-Moffet Bay Section (61,671 salmon; Table 2). The indexed total escapement estimate was 351,700 salmon (Table 10). Escapements were spotty. Strong escapements were observed in the Izembek-Moffet Bay Section, Peterson Lagoon, Lawrence Valley Creek (Herendeen Bay), and in the Meshik River. Poor escapements were observed in Franks Lagoon and Warm Springs Bay. The balance of the North Peninsula had fair chum salmon escapements.

In 1992, the North Peninsula coho harvest totaled 206,813 salmon (Table 1). The major production locations by number of fish harvested were Nelson Lagoon Section (73,372), Cinder River Section (73,121), Bear River Section (22,099), Inner Port Heiden Section (16,744), and Ilnik Section (12,985; Table 2). Escapements were good in Nelson Lagoon, Cinder River, Meshik River, and Ilnik Lagoon, these systems were the only major streams surveyed during good conditions (Table 31).

The 1992 chinook harvest totaled 13,144 salmon (Table 1). The indexed total escapement estimate was 6,600 salmon (Table 10). Escapements were below objectives in most systems. Inner Port Heiden and Nelson Lagoon were the two largest producers. The Inner Port Heiden estimated indexed total escapement of 1,400 salmon may be low because only one survey was flown, the escapement goal is 2,000 to 4,000 salmon (Table 32). The Nelson Lagoon estimated indexed total escapement was 3,000 salmon (Table 32), slightly below the goal of 3,200 to 6,400 salmon. Most of the chinook catch occurs during fisheries targeting on sockeye salmon (Table 7).

In 1992, the North Peninsula pink harvest was 194,395 salmon (Table 1). Herendeen Bay had the largest harvest with 106,243 pink salmon (Table 7). As was the case in 1990, Lawrence Valley Creek produced the bulk of the Herendeen Bay pink salmon escapement (Table 31). The 1992 Lawrence Valley Creek indexed total escapement was 145,000 pink salmon. Escapement data is incomplete for most of the area outside of Bechevin Bay. The 1992 pink indexed total escapement in Bechevin Bay was 49,400 salmon.

SOUTH PENINSULA

Introduction

Catch and escapement information regarding the South Peninsula are presented in Tables 39-101.

Salmon fisheries in the South Alaska Peninsula date back to at least 1888 when canneries were reportedly constructed at Orzinski (Orzenoi) Bay and Thin Point Cove. However, the earliest catch records for the Alaska Peninsula Area date back only to 1906 (Table 1). Early catches were dominantly sockeye salmon with a few chinook and coho salmon. The first year in which pink and chum salmon catches exceeded 500,000 each was 1916.

The major species produced in South Peninsula streams is pink salmon (Tables 43-47). Runs fluctuate dramatically over time due to the magnitude of parent escapements and environmental

conditions. During 1970-91, commercial catches ranged from 35,783 pink salmon in 1973 to 10,665,171 in 1984 (Tables 98-101). Most systems produce large runs on both even and odd year cycles, however, most of the streams between Cold Bay and Unimak Bight are basically even year producers. Dry Lagoon and Apollo Creeks on Unga Island also seem to be even year cycle systems. Pink salmon runs usually arrive in force about July 20 and peak about August 1 (Figure 24). After August 15-20 the fish quality is usually poor due to water marking.

Chum salmon are the second most important locally produced species in South Peninsula waters (Tables 43-47). During 1970-91, commercial catches ranged from 29,928 in 1975 to 1,394,332 in 1986 (Tables 98-101). Chum salmon runs are somewhat more stable than pink salmon runs due to the presence of more than one age class and the tendency for chum salmon to select spawning locations that are less susceptible to scouring and freezing. Chum salmon runs start earlier and last longer than those of pink salmon (Figure 24). There is also a large variation in run timing between different chum salmon stocks.

The South Peninsula has numerous sockeye salmon stocks (Tables 43-47). Most stocks are small although Thin Point and Middle Lagoon (Morzhovoi Bay) produced substantial runs during the 1920's and 1930's. These systems appear to be returning to high production levels through good escapement monitoring and an aggressive enforcement program. Thin Point and Morzhovoi Lakes are suspected of having rearing capacities greatly in excess of spawning capacities. The potential of producing substantially larger runs through supplemental methods exists. Orzinski (Orzenoi) Lake is an important contributing system to Southeastern District catches. Post-June South Peninsula sockeye salmon catches are often substantial (Figure 23). During 1970-91, commercial catches ranged from 3,449 in 1975 to 1,040,231 in 1990 (Tables 98-101). Many sockeye salmon harvested in the Southeastern District Mainland fishery are destined for streams in the Chignik Management Area (ADF&G 1992 and Appendix A). Post June South Peninsula tags from sockeye salmon have been returned from South and North Peninsula systems, Bristol Bay, Chignik, Kodiak, and Cook Inlet (McCullough 1990).

Although coho salmon are harvested through September, most South Peninsula coho salmon are harvested incidentally while fisheries are targeting pink and chum salmon during mid-July to mid-August (Figures 23 and 24). Historically, South Peninsula coho salmon catches have demonstrated long periods of varying abundance (Figure 25). From 1923 through 1946, catches were at a high level, averaging 148,000 salmon annually (Table 1). During 1947-58, the average harvest decreased to about 50,000 salmon. The 1959-77 average South Peninsula coho harvest was only 12,000 salmon, with only 66 coho salmon harvested in 1975. Catches increased substantially during 1978-92, averaging 278,000 salmon. In 1988, the largest reported catch

occurred, 505,278 salmon. In 1928-50, Aleutian Islands Management Area catches were combined with the South Peninsula; the Aleutian Islands contribution was probably insignificant. During years when Aleutian Islands coho salmon harvests were separated from the South Peninsula harvest, the largest documented coho salmon catch in the Aleutians was 4,400 salmon in 1918 and the catch totaled less than 200 salmon during most years.

Chinook salmon are of minor commercial importance in South Peninsula waters, averaging only 6,300 salmon harvested during 1970-92 (Table 1). There are no chinook salmon spawning systems in South Peninsula waters. Chignik River is the only known chinook salmon producer on the Pacific side of the entire Alaska Peninsula (Figure 2).

There are approximately 23 sockeye salmon, 110 pink salmon, and 72 chum salmon producing systems along the South Peninsula (including islands)(Murphy 1992). To date 57 South Peninsula coho producing systems have been identified. Two methods are used to calculate escapements: 1) indexed escapement (Appendix D), and 2) estimated escapement (Johnson and Barrett 1988). The indexed escapement is used inseason and for historical comparisons because the estimated escapement method has only been employed since 1986. The 1982-91 average South Peninsula indexed total escapement is 67,000 sockeye, 2,483,000 pink, and 335,000 chum salmon. The South Peninsula estimated total salmon escapement is 103,978 sockeye, 2,632,554 pink, 553,893 chum, and 31,849 coho salmon (Tables 45-47)(coho escapement data are based on limited surveys; Murphy 1992).

All South Peninsula fisheries are usually closed during late August to September 1 to achieve good pink and chum salmon escapements.

A large portion of Alaska Peninsula fishermen's earnings comes from harvesting migrant salmon. The South Peninsula interception fisheries include the South Unimak (False Pass) June fishery, the Shumagin Islands June fishery, the Southeastern District Mainland (Balboa-Stepovak or Stepovak) fishery, and early to mid-July cape fisheries (Figure 4).

June Fisheries

Introduction

South Peninsula June fisheries harvest data are presented in Tables 48-63.

The South Unimak (Figure 11) and Shumagin Islands (Figures 6 and 14) June fisheries date back to at least 1911 (Table 51). The dominant stocks targeted by these fisheries are Bristol Bay bound sockeye salmon, which has caused controversy between Alaska Peninsula-Aleutian Islands and Bristol Bay fishermen for many years (Eggers et al 1991). During the late sixties, the South Unimak-Shumagin fisheries were open to commercial fishing seven days per week regardless of Bristol Bay run strength (Table 49). This caused many debates at Fish and Game Board meetings, with special meetings occurring over this one issue during the early seventies. South Unimak-Shumagin June management strategy was decided on a year by year basis during 1972-74 due to very low anticipated Bristol Bay sockeye salmon returns. In 1974, both fisheries were closed during June.

Beginning in 1975, the BOF implemented an allocation plan where the South Unimak-Shumagin Islands June fisheries would be managed on guideline harvest levels allocated on the basis of predicted Bristol Bay inshore sockeye salmon harvests. Based on historical catch information, 6.8 and 1.5 percent of the forecasted inshore Bristol Bay harvest was allocated to the South Unimak and Shumagin Islands June fisheries, respectively. To reduce the possibility of overharvesting any segment of the Bristol Bay run, the guideline harvest level was allocated to discrete time periods based on historical catch data. The allocation in percent by time period is listed as follows:

<u>Time Periods</u>	<u>South Unimak</u>	<u>Shumagin Islands Section</u>
June 1 - 11	5%	9%
12 - 18	29%	28%
19 - 25	51%	41%
<u>26 - 30</u>	<u>15%</u>	<u>22%</u>
Total	100%	100%

If the guideline harvest for an individual time period was not reached, the unharvested portion was lost to the fishery. If the guideline harvest for an individual time period was exceeded, the overharvest was subtracted from the total season allocation.

Chum salmon are taken incidental to sockeye salmon during the South Unimak-Shumagin Islands June fisheries. In 1982 an unusually large harvest of approximately 1.1 million chum salmon (Tables 52-56) along with a failing fall Yukon River chum salmon run brought pressure from fishermen in the Arctic-Yukon-Kuskokwim (A-Y-K) Region to curtail or eliminate the fishery. Unlike the sockeye salmon which are predominantly bound for one area (Bristol Bay), chum salmon are headed for a variety of areas ranging from Japan to Kotzebue to Prince William Sound (Eggers et al 1991).

In an effort to limit the chum salmon by-catch, the BOF in 1984 placed further restrictions on the fishery. The new restrictions consisted of allowing no more than 96 hours of fishing during a seven day period and no more than 72 consecutive hours. This regulation allowed for closed fishing periods (referred to as windows) between open periods to increase the opportunity for chum salmon to escape.

During 1986 only, the following additional restrictions were used.

1. No fishing before June 11.
2. No fishing during June 26-30 and the loss of that period's sockeye salmon allocation.
3. A 400,000 chum salmon catch ceiling.

These restrictions plus low availability of sockeye salmon resulted in only 470,000 of the 1,107,000 sockeye allocation being harvested.

During the fall 1986 BOF meeting, the board adjourned (with three members resigning) without taking any action on the South Unimak-Shumagin Islands June fisheries. The regulations during 1987 were the same as during 1984-85.

A tagging program was carried out during 1987, indicating that chum salmon go to a variety of places after passing the South Peninsula in June (Eggers et al 1991). The Yukon River fall contribution was small during this year.

During the spring 1988 meeting, the BOF placed a 500,000 (fish) chum cap on the South Unimak-Shumagin Islands June fisheries (once a total of 500,000 chums are harvested the fishery will be closed; Shual and Schwarz 1989). It would be very difficult or impossible to harvest the sockeye allocation during many years due to the chum cap. In 1988, the South Unimak sockeye salmon harvest was reduced by approximately 669,000 fish due to the 500,000 chum cap. The 669,000 reduction is in addition to the estimated reduction of 117,000 sockeye that would have been caused by other restrictions (no more than 96 hours to be fished in any 7 day period nor more than 72 consecutive hours). The Shumagin fishery harvested its 1988 sockeye salmon allocation.

In 1989, South Unimak and Shumagin Islands fishermen did harvest their June sockeye salmon allocations (Shaul, Schwarz, Quimby 1990). However, this was due to the Bristol Bay forecast (and consequently the South Unimak and Shumagin quotas) being low (Tables 57-59). If the Bristol Bay inshore sockeye harvest had been perfectly predicted, the South Unimak fishery

would have fallen approximately 400,000 fish short of its sockeye salmon allocation, due to the 500,000 salmon chum cap. Sockeye salmon catch rates were so high in the Shumagin Islands that this fishery could have easily taken its allocation if the Bristol Bay harvest had been perfectly forecasted before the chum salmon ceiling was reached.

After the 1989 season, the BOF made the following changes to the South Unimak and Shumagin Islands June fisheries (ADF&G 1992; Appendix A):

1. The starting date of the fishery was delayed until June 13 as the chum salmon percentage is normally higher during early June.
2. The chum salmon ceiling for both fisheries combined was raised from 500,000 to 600,000.
3. The "window regulations" were eliminated as there did not seem to be a need for both a chum salmon ceiling and windows.
4. The sockeye salmon allocation periods and allocations were changed and are presently the same for each fishery.

June 13-18	35%
June 19-25	45%
<u>June 26-30</u>	<u>20%</u>
Total	100%

If catches in either fishery fall below the guidelines in the June 13-18 period, those unharvested sockeye salmon up to a maximum of five percent of the total allocation for that fishery may be harvested during the June 19-25 period. The June 26-30 period cannot be used to make up for underharvests during the first two periods. Available information and thinking was that the sockeye salmon stock composition between the first two periods was very similar, however the June 25-30 stock composition at South Unimak-Shumagin Islands may be dominated by fewer and later stocks.

5. Unlimited seine leads were eliminated at South Unimak and leads of 50 to 150 fathoms are the only legal lengths for the entire Alaska Peninsula.
6. For the first time, maximum depth restrictions were placed on seine and gillnet gear. For the entire Alaska Peninsula Area seine depth may not exceed 375 meshes in depth. Seine mesh may not exceed 3-1/2 inches except the first 25 meshes above the lead line may not be more than 7 inches. Gillnet gear used in South Peninsula waters may not exceed 90 meshes in depth.
7. The area comprising the South Unimak fishery was extended to include the following portions of the Southwestern District located outside the Ikaton Bay Section:

- (a) all waters north and west of a line from Cape Pankof Light to Thin Point.
- (b) all waters enclosed by a line from Thin Point to Stag Point on Deer Island to Dolgoi Cape and from Bluff Point on Dolgoi Island to Arch Point.

In 1990, sockeye salmon were not available in large numbers at either the Shumagin Islands or South Unimak despite the fact that Bristol Bay experienced one of its largest runs on record (Shaul et al 1991). Windy weather plagued fishing operations but fish abundance also seemed low, especially in view of the huge run that returned to Bristol Bay. The Shumagin Islands sockeye salmon harvest was 256,000 fish with a guideline harvest level 240,000 (Table 52). The Shumagin Islands were open to fishing a total of 224 hours during 10 days in June (Table 63). At South Unimak, the harvest was 1,091,000 (1,087,000 allocation; Table 52). The South Unimak June fishery was open to fishing for 269 hours during 13 days (Table 63). A total of 64,000 chum salmon were caught in the Shumagin Islands and 455,000 were caught at South Unimak for a combined total of 519,000 chum salmon (Table 52).

If the Bristol Bay sockeye run had been perfectly forecasted, the Shumagin Islands and South Unimak quotas would have been 518,000 and 2,347,000 respectively (Tables 57-59). However, due to the 600,000 chum ceiling, the Shumagin Islands fishery would have fallen approximately 35,000 sockeye salmon short of its corrected quota while South Unimak would have fallen approximately 1,050,000 sockeye salmon short.

With no chum salmon ceiling, the Shumagin Islands fishery would have easily taken its sockeye salmon allocation in 1990 with a total chum salmon catch of approximately 135,000. Even without a chum salmon ceiling, the South Unimak fishery would have only taken about 1.6 million of its corrected allocation while catching approximately 700,000 chum salmon.

In 1991, the Shumagin Islands June sockeye salmon harvest was 333,000, slightly under the allocation of 347,000 (Table 52). A total of 103,000 chum salmon were harvested in the Shumagin Islands. The Shumagin Islands June fishery was open 88 hours during 5 days (Table 63). The 1991 South Unimak June sockeye salmon catch was 1,216,000 which was well under the guideline harvest level of 1,573,000 (Table 52). The reason for the guideline harvest level not being reached was the chum salmon cap being exceeded. The South Unimak chum salmon harvest was 669,000 chum salmon which brought the combined South Unimak-Shumagin Islands chum salmon catch to 772,000. The South Unimak fishery was open 158 hours during 8 days in June (Table 63).

It is not known at this time what impact the reduction in gear depth, adopted by the BOF prior to the 1990 season (ADF&G 1992), had on gear efficiency or if the gear reduction caused a reallocation between gear types.

Test fishing in the Shumagin Islands Section during June was instituted in 1990 to aid the South Peninsula salmon management staff in determining sockeye to chum salmon ratios and salmon average weights by species (Shaul et al 1992). ADF&G attempts to have commercial salmon fishing periods when the catch of sockeye salmon is expected to be high in relation to a low chum salmon catch. The ratio of sockeye to chum salmon is normally low in early June, highest when the sockeye run is peaking during mid to late June and during some years is again low during late June (Figures 17 and 18). During 1970-92, most sockeye and chum salmon are harvested during June 12-26 in both the Shumagin Islands and South Unimak fisheries.

Test fishing occurs before the June 13 regulated opening date and between commercial salmon fishing periods to determine the most favorable periods of sockeye to chum salmon ratios (Shaul et al 1992). Test fishing was standardized to purse seine gear making 20 minute sets at Popof Head, Middle Set, and Red Bluff; additional sets are made if time allows (McCullough and Shaul 1992). During off-loading, the catch is separated by species, counted, and weighed. Purse seine vessels are selected randomly from a list of skippers that have expressed an interest in the test fishery. The skipper and usual crew are aboard as well as an ADF&G observer.

In 1990, test fishing occurred on June 10 and resulted in a 3.8:1.0 sockeye to chum salmon ratio and the fishery was opened on June 13 (Shaul et al 1992).

In 1991, test fishing occurred on June 9-13. The ratio of sockeye to chum salmon prior to June 12 was not favorable for a commercial fishing period; the ratio ranged from 0.4:1.0 and 1.9:1.0 sockeye to chum salmon (Shaul et al 1992). On June 13 the ratio improved to 3.3:1.0 and on June 14 was 4.7:1.0. The first commercial salmon period occurred on June 15, the commercial ratio was 3.4:1.0. The Shumagin Islands Section was open to commercial salmon fishing on June 15, 17, 18, 20, and 22. Overall, the June Shumagin Islands Section commercial sockeye to chum salmon ratio was 3.2:1.0.

South Unimak-Shumagin Islands 1992 Summary

The BOF, during November 1991, changed the South Unimak-Shumagin Islands June chum cap from 600,000 fish to 40 percent of the sockeye salmon allocation and the cap was not to exceed 900,000 chum salmon. Due to the large 1992 Bristol Bay sockeye salmon forecast, the chum

salmon cap was established at 900,000 salmon. The 900,000 chum salmon cap generated a great deal of debate with Arctic-Yukon-Kuskokwim (A-Y-K) Region fishers. The BOF relied extensively on the 1987 South Unimak-Shumagin Islands chum and sockeye salmon tagging study (Eggers, Rowell, and Barrett, 1991) when they increased the chum salmon cap.

An error in the 1987 tagging study was discovered which indicated the study had underestimated the impact of the South Unimak and Shumagin Islands June fisheries on A-Y-K stocks, including those of Norton Sound. This provided enough new information for the South Unimak-Shumagin Islands chum salmon cap issue to be brought up for consideration again at the March 1992 BOF meeting in Juneau. After reconsideration, the BOF changed the chum salmon cap to an annual 700,000 fish limit (ADF&G 1992).

Fishermen from Norton Sound filed for a preliminary injunction against the South Unimak-Shumagin Islands June fishery. The case was heard in Nome, less than a week before the fishery was to take place. The request for a preliminary injunction was denied and the South Unimak-Shumagin Islands fishery was allowed to proceed.

To minimize the harvest of chum salmon, ADF&G closed waters around Sanak Island, bounded by the latitude (Figure 11) of Hague Rock and the longitude of Cape Pankof Light below Hague Rock's latitude to commercial salmon fishing during June (Shaul and McCullough 1992). Historically, Sanak Island waters had been fished sporadically, but had produced unacceptably high chum to sockeye salmon ratios.

The sockeye guideline harvest level for the South Unimak and Shumagin Islands June fisheries is 6.8 percent and 1.5 percent, respectively, of the Bristol Bay sockeye harvest forecast (ADF&G 1992). Based on the 1992 Bristol Bay forecast, the 1992 sockeye guideline harvest levels were as follows (Shaul and McCullough 1992):

Period	Percent	South Unimak	Shumagin Islands	Total
June 13 - 18	35%	686,000	151,000	837,000
June 19 - 25	45%	881,000	195,000	1,076,000
June 26 - 30	20%	392,000	86,000	478,000
Total	100%	1,959,000	432,000	2,391,000

In 1992, the South Unimak and Shumagin Islands Section June fisheries first fishing period was delayed until June 15 in an attempt to minimize the chum salmon harvest. Initial test fishing in the Shumagin Islands Section on June 9 resulted in an acceptable sockeye to chum salmon ratio of 3.2:1.0 (Table 48). Test fishing results on June 10 and June 11 were unacceptable, as the sockeye to chum salmon ratio was 0.8:1.0 on June 10 and 0.5:1.0 on June 11. The ratio of sockeye to chum salmon improved to 1.6:1.0 on June 12 and indicated continuing improvement on June 13 with a ratio of 3.3:1.0. The ratio of sockeye to chum salmon is normally low in early June, highest when the sockeye salmon runs are peaking during mid and late June, and during some years is again low during late June.

The first fishing period was announced for 6:00 a.m. until 10:00 p.m. during June 15 in both fisheries (Appendix B). During late afternoon, June 15, ADF&G began receiving calls from fishermen at South Unimak reporting that the catch was nearly all sockeye salmon and requesting an extension. The fishing period was extended 16 hours until 2:00 p.m. June 16 at South Unimak. The June 15 South Unimak catch was 223,441 sockeye and 26,333 chum salmon (Table 60), an 8.5 sockeye to chum salmon ratio. In the Shumagin Islands, the June 15 harvest was 90,174 sockeye salmon and 26,485 chum salmon, a 3.4 to 1.0 ratio.

The South Unimak June 15 harvest was tallied on the morning of June 16, and the fishery was extend another 24 hours until 2:00 p.m., June 17. An 8:00 a.m. until 4:00 p.m. fishing period was announced for the Shumagin Islands on June 17. It was believed that the Shumagin Islands June 13-18 sockeye salmon allocation would be exceeded with any additional fishing time beyond the eight hours. In the Shumagin Islands, 125,455 sockeye and 32,729 chum salmon were harvested in the eight hour period and the Shumagin Islands remained closed until June 19 (Table 60).

The South Unimak fishery was extended day after day, based on the previous day's catch until 2:00 p.m. June 18 when it was projected that the June 13-18 allocation would be taken. During June 15-18, a total of 869,212 sockeye and 129,106 chum salmon were harvested, a 6.7 to 1.0 ratio.

With the sockeye to chum salmon ratio being so good, it was decided to reopen South Unimak from 12:01 a.m. until 10:00 p.m. during June 19. The midnight opening drew much criticism from purse seine fishermen, although midnight openings were standard in the early eighties. A total of 370,704 sockeye and 58,778 chum salmon were harvested in the June 19 South Unimak fishing period. An 8:00 a.m. until 8:00 p.m. fishing period in the Shumagin Islands yielded 149,017 sockeye and 34,015 chum salmon (Table 60).

An 8:00 a.m. until 12:00 noon fishing period in the Shumagin Islands during June 21 produced a harvest of 25,513 sockeye and 3,949 chum salmon. The sockeye allocation through June 25 had been exceeded and by regulation (ADF&G 1992) the fishery could not open again until June 26 (Table 60).

A South Unimak fishing period was announced for 6:00 a.m. until 10:00 p.m. during June 21. During the opening, fishermen reported that the sockeye to chum salmon ratio remained high and a 16 hour extension was granted until 2:00 p.m. June 22. Early in the morning of June 22, ADF&G in Cold Bay overheard purse seine fishermen at Cape Lutke trying to get other fishers to stop fishing on a large mass of chum salmon that had suddenly arrived. A tender reported small chum salmon and it was feared that the seiners would catch a huge number of chum salmon in very little time. The Cape Lutke Section was closed at 11:00 a.m., three hours earlier than scheduled due to the reported chum salmon. Later reports indicated that the chum salmon were large in size and abundant. The total June 21-22 South Unimak harvest was 712,759 sockeye and 121,051 chum salmon (Table 60).

After June 22, only 42,000 sockeye remained on the Shumagin Islands quota. The inseason verbal reports indicated only 32,000 were left. Only 6,000 sockeye remained on the South unimak quota, although inseason verbal totals (the figures used to manage the fisheries) indicated 34,000 sockeye were left to be harvested. It was not known if the catch rates would remain high after a four day closure, although the Shumagin Islands had demonstrated high late June catches in prior years. It was decided to allow a 12:00 noon until 5:00 p.m. fishing period at South Unimak with the Cape Lutke Section remaining closed. It was felt that with Cape Lutke closed, the South Unimak sockeye salmon catch rate would be slower. Fishing at Cape Lutke was not needed at this time to reach the sockeye salmon allocation and there was the possibility that large numbers of chum salmon could still be in the vicinity of Cape Lutke. A 12:00 noon until 2:30 p.m. fishing was allowed during June 26 in the Shumagin Islands.

The June 26 period in the Shumagin Islands produced a catch of 21,675 sockeye and 5,134 chum salmon (Table 60). The June 26 period at South Unimak produced a catch of 93,347 sockeye and 14,953 chum salmon, which brought the final total harvest figure to 2,046,022, compared to a verbal total of 2,014,000.

The Shumagin Islands June fishery was open five days for a total of 42 1/2 hours and produced a catch of 411,834 sockeye and 102,312 chum salmon (Tables 60 and 63). In-season verbal catch reports indicated the June catch was 421,219 sockeye and 101,925 chum salmon. The South

Unimak fishery was open eight days for a total of 139 hours and produced a catch of 2,046,022 sockeye and 323,891 chum salmon (Tables 60 and 63).

In-season reports indicated that about 10,800 sockeye salmon remained on the Shumagin Islands June allocation, but South Unimak verbal reports indicated that the allocation at South Unimak was exceeded by 50,000 sockeye. Because the combined Shumagin Islands and South Unimak sockeye salmon allocation was exceeded by an estimated 44,000 salmon, both fisheries were closed for the remainder of June.

The combined South Unimak-Shumagin Islands June harvest was 2,457,856 sockeye and 426,203 chum salmon, well below the 700,000 chum salmon cap, but exceeding the sockeye allocation by 66,856 salmon (Tables 60-62).

During the 1992 June fishery, purse seine fishers harvested 58.3% (1,192,202) of the South Unimak sockeye salmon and 90.9% (374,258) of the sockeye salmon caught in the Shumagin Islands (Table 53). Drift gillnet and set gillnet fishers accounted for 37.4% (765,752) and 4.3% (88,068) of the South Unimak sockeye salmon harvest, respectively (Table 53). Set gillnet fishers accounted for 9.1% (37,576) of the Shumagin Islands sockeye salmon harvest (Table 53 and Figure 21). Purse seine fishers harvested 63.2% (204,717) of the South Unimak chum salmon and 96.3% (98,509) of the chum salmon caught in the Shumagin Islands (Table 53 and Figure 22). Drift gillnet and set gillnet fishers took 35.6% (115,401) and 1.2% (3,773) of the South Unimak chum salmon, respectively. Set gillnet fishers accounted for 3.7% (3,803) of the Shumagin Islands chum salmon harvest (Figure 22). During June, the sockeye to chum salmon ratio at South Unimak was 6.3 : 1.0 and at the Shumagin Islands was 4.0 : 1.0 and for both fisheries combined was 5.8 : 1.0 (Table 54). During June 112 purse seine, 141 drift gillnet, and 71 set gillnet permit holders commercially fished in South Peninsula waters (Table 50; Figures 19 and 20).

South Peninsula Post June Fisheries

Introduction

Tables 64-105 contain data regarding the South Peninsula Post June fisheries and South Peninsula salmon escapement information.

A new approach will be taken in discussing and presenting post June fisheries from prior annual management reports. Prior reports presented post June harvest data in text and tables by sections,

districts, and fisheries. Because current post June fisheries have changed since the original sections and district boundary lines were presented, a new approach is desirable. Some tables will still present data by section and district for historical comparison but some data and text will be different. New post June text and data will be presented as: 1) South Peninsula as a fishery (Figure 2); 2) Southeastern District as a fishery with the Shumagin Islands Section fisheries treated separately from the Southeastern District Mainland fisheries (Figure 14); 3) McGinty Point to Moss Cape area (Figure 14); 4) Belkofski to Kenmore Head area (Figure 14); and 5) Kenmore Head to Scotch Cap area (Figure 14). Reasons for discussing the post June fisheries in these units include: 1) the Southeastern District Mainland fishery has a separate management plan from the balance of the South Peninsula (5 AAC 09.360; Figure 5); 2) the Shumagin Islands Section is a manageable area to discuss separately; 3) the McGinty Point to Moss Cape area, although noted for its local pink and chum production, also harvests migratory sockeye salmon in cape areas; 4) the Belkofski to Kenmore Head area harvest is dominated by pink and chum salmon with local sockeye salmon runs in Thin Point Cove, Cold Bay and Morzhovoi Bay, but also includes migratory sockeye salmon of unknown origin which are harvested in the vicinity of Belkofski Bay, Deer Island, and King Cove; and 6) the Kenmore Head to Scotch Cap area combines the only area in South Peninsula waters where drift gillnet gear is allowed (Figure 3).

For those with statistical maps or databases the following statistical numbers apply to the 1970-92 database for each fishery: 1) South Peninsula: 28100 through 28599, 2) Southeastern District: 28100 through 28299 and 28375, 28380, and 28390, 3) Southeastern District Mainland: 28100 through 28199 and 28375, 28380, and 28390, 4) Shumagin Islands Section: 28200 through 28299, 5) McGinty Point to Moss Cape: 28315, 28317, 28321, 28323, 28324, 28325, 28326, 28351, 28352, 28361, 28362, 28363, 28364, 28365, 28370, 28436, 28437, and 28438, 6) Belkofski to Kenmore Head: 28312, 28320, 28331, 28332, 28333, 28334, 28335, 28341, 28342, 28442, 28445, 28455, 28462, 28465, 28467, 28475, 28477, and 28480, and 7) Kenmore Head to Scotch Cap: 28310, 28330, 28410, 28420, 28430, 28440, 28460, 28470, 28472, 28490, 28510, 28520, 28530, 28540.

Prior to 1992, South Peninsula waters east of Rock Island opened to commercial salmon fishing about July 6, except in the Southeastern District Mainland fishery, which is managed prior to July 26 on a separate management plan (5 AAC 09.360)(Figure 4 and 5). Prior to 1976, post June South Peninsula fisheries were open five days per week, with total season closures on August 10 to provide adequate escapement and maintain product quality (Stopha, McCullough, and Shaul 1992). From about 1976 to 1991, the salmon fishery was managed by emergency order based on local stock run strength. Fishing periods from July 6 to about July 18 were based on chum salmon run strength, and from July 18 through about August 20 on pink salmon run strength

(Figure 24). Fishing continued into late August in years of strong pink salmon runs. Migratory salmon were also harvested during these openings, and contributed a substantial portion of the total post June harvest in some years (Figure 23). Emergency orders based on coho salmon runs allowed fishing in September.

In November 1991, the BOF established the Post June Salmon Management Plan for the South Alaska Peninsula (5 AAC 09.366; Stopha, McCullough, Shaul 1992). This plan allows for the harvesting of local stocks through July 20 in terminal areas, but closes the remainder of the South Peninsula formerly opened in post June fisheries. The BOF decision was based on the concept that local pink and chum salmon could be caught in terminal areas early in the season without sacrificing product quality, while at the same time allowing migratory salmon to pass through the South Peninsula area. After July 19, the board concluded that South Peninsula fishers needed to catch pink salmon in their traditional cape harvest areas to maintain product quality and to allow for available processing capacity. Under this new plan, commercial salmon fishing from July 6-19 was to be restricted to terminal fishing areas opened by emergency order, based on local stock run strength as gauged by harvest and escapement rates. These areas include Zachary Bay and Inner Pavlof Bay, and the Cold Bay, Thin Point, Canoe Bay, and Morzhovoi Bay Sections. From July 20 through the remainder of the commercial salmon season, the entire South Peninsula could be opened to commercial salmon fishing by emergency order based on local stock strength.

After the closure of South Peninsula June fisheries (June 26 was the last June fishing period), fishermen had the choice of moving to areas within the Alaska Peninsula Management Area remaining open (portions of the North Peninsula and Aleutian Islands), remaining in the South Peninsula area for likely one day a week fishing periods, or to go on vacation for three weeks. Most floating processors moved to Bristol Bay while shore based processing facilities laid off crews and tenders and did maintenance work.

In accordance with an order issued on July 10, 1992 by Alaska State Superior Court Judge Hopwood (Third Judicial District, Kodiak) in Stepovak-Shumagin Set Net Association v. State of BOF, Case No. 3K0-92-239 CI, which granted plaintiff Stepovak-SSNA an injunction staying the enforcement of 5 AAC 09.366 (the Post June Salmon Management Plan for the South Alaska Peninsula), a commercial salmon fishing period was announced for July 13-14 in South Peninsula waters. The period was delayed until July 13 to allow fishers, industry, and ADF&G adequate time to prepare for the unexpected opening.

1992 Immature Salmon Concerns

Prior to the July 13-14 commercial salmon fishing period, ADF&G test fished in Shumagin Islands Section waters to determine the presence and abundance of immature salmon (McCullough and Shaul 1992). During normal fishing operations, immature salmon of three species are sometimes inadvertently gilled in purse seine gear in South Peninsula waters: chinook salmon, sockeye salmon, and chum salmon.

Historically, the presence of immature salmon in South Peninsula waters has caused the curtailment of all commercial fishing in effected areas during late June or July in 1963, 1968, 1969, 1974, and 1979 and purse seine fishing in 1989-91 (Shaul et al. 1992, McCullough 1992). After 1979, regulations were adapted curtailing only purse seine fishing in affected areas (ADF&G 1992). The problem associated with immature salmon is restricted to the purse seine fleet. Immature salmon are gilled in the seine webbing resulting in what is likely a 90-100% mortality factor. By regulation, seine mesh size may not be more than 3 1/2 inches except for the first 25 meshes above the lead line, which may not be more than 7 inches (ADF&G 1992). By regulation, gillnet mesh size can not be less than 5 1/4 inches; the larger mesh size in gillnet gear allows for unrestricted passage of immature salmon through gillnet gear.

Historically, immature salmon cause the greatest problem in the Shumagin Islands Section. In the Shumagin Islands Section, most purse seine fishing effort occurs in the near shore waters of Popof Island from Popof Head to Red Bluff (Figure 7). Deep water offshore of the beach allows nets to be deployed close to the shore. Twenty-minute sets, in vessel rotation, are used to catch salmon migrating westward. Catches of immature salmon were first brought to the attention of the ADF&G in 1963. Currently, about 55 purse seine permit holders must either remain on the beach or move to other open areas that are not as productive as the Shumagin Islands Section; otherwise, the waiting period at favored sites is extended by their presence. Immature salmon usually migrate out of the Shumagin Islands Section by July 23. In 1992, purse seine gear closures remained in effect until July 29.

In 1990, test fishing was standardized to purse seine gear making 20 minute sets and fully pursing the gear. The test fish project used commercial purse seines that are 250 fathoms in length and 375 meshes in depth. The seine mesh is 3 1/2 inches except for the first 25 meshes above the lead line, which is usually seven inch mesh. The test fish project and commercial fishermen do not use leads in the Shumagin Islands Section. Sites used to set the gear included: Popof Head, Middle Set, and Red Bluff. Additional sets were made if time allowed. If large numbers (greater than 1,000) of immature salmon were observed being gilled during any set, the set could be

terminated prior to the 20 minute time limit. Each day a permit holder was randomly selected from a list of permit holders interested in the test fishery. The standard ADF&G short term vessel charter agreement between the State of Alaska and the vessel owner was used. The permit holder supplied all necessary fishing material and crew, while ADF&G supplied a biologist to count and identify by species the number of immature and mature salmon per set. Immature salmon were defined as any salmon gilled in seine webbing and weighing less than three pounds per fish; this was also the weight below which buyers refused to pay for salmon. Mature salmon were sold to pay charter cost and immature salmon were dumped at sea unless they could be given away for subsistence use. During off-loading the mature catch was separated by species, counted, and weighed.

Catches were occasionally sampled from purse seine gear in the Shumagin Islands Section. Immature salmon gilled in seine web were opportunistically sampled. Since all catch sampling occurred before sorting within the fishing vessel and cannery, there was no preselection of immature salmon. Although not tested, each sample was assumed to be representative of the by-catch within the Shumagin Islands Section. While this insured that samples were randomly selected from each fishing vessel sampled, the samples may not be characteristic of the population structure because the distribution of the population is unknown in the fishery. Age was determined by examining scales. Length measurements were taken from mid-eye to the fork-of-the-tail. Sex compositions and sexual maturity were computed for each sample. Sex and sexual maturity was determined by internal observation of the gonads.

In 1992, ADF&G chartered purse seine vessels from July 10-29 to determine the abundance of immature salmon. Test fish results from the Shumagin Islands were used as an indication of the presence of immature salmon in the South Central, Southwestern, and Unimak Districts of the Alaska Peninsula Management Area. Portions of the South Central, Southwestern, and the Unimak District were closed, to purse seine gear at times due to the presence of immature salmon.

During the test fishery of July 10-11 and the commercial salmon period on July 13-14 immature salmon were not caught in sufficient numbers to warrant closure of any South Peninsula waters due to their presence (Table 64). Test fishing on July 15-17 resulted in substantial catches of immature salmon. ADF&G closed the Shumagin Islands Section and waters near Sanak Island (Unimak District) to purse seine gear during the next period of July 18-19 (Appendix B). After the July 18-19 period, fishermen also reported immature salmon in portions of the Southwestern District. Test fishing from July 19-22 resulted in continued large catches of immature salmon, although a trend of decreasing catches was occurring. During the next period of July 23-25, the

Shumagin Islands Section, all waters within one nautical mile of Poperechnoi Island, and the Sanak Island area were closed to purse seine gear. Test fishing from July 24-26 continued to indicate that immature salmon numbers were decreasing. Initially, during the July 27-29 period only gillnet gear was allowed in the Shumagin Islands Section, near Sanak Island, and within one nautical mile of Poperechnoi Island. Test fishing on July 27 resulted in less than 100 immature salmon caught per test set and those areas closed to seining were opened during the morning of July 28. ADF&G observations of the commercial catch on July 28 indicated an average catch of 176 immature salmon per set. The Shumagin Islands Section was again closed to purse seine gear on July 28. Test fishing on July 29 resulted in an average of 61 immatures per set and the Shumagin Islands Section was opened to commercial salmon fishing with purse seine gear on the afternoon of July 29. ADF&G observations of the seine fleet during the remainder of the fishing period indicated that the immature catch was acceptable.

The catch of immature salmon during the commercial salmon fishery for the rest of the fishing season was minor (probably averaging less than 1 immature salmon per set) and did not warrant further closures of South Peninsula waters to purse seine gear.

Test fish results indicated that from July 10-29, most of the immature salmon caught were sockeye salmon (46.8 to 92.9%; Table 64). Chum salmon produced most (5.1% to 44.2%) of the remaining immature salmon catch. The estimated age composition of immature chinook salmon was 100.0% age 1.1 and the male to female ratio was 1.6 : 1.0 (Tables 65 and 66). The estimated age composition of immature sockeye salmon was 16.1% age 1.1 and 77.6% age 2.1 and the male to female ratio was 1.7 : 1.0 (Tables 67 and 68). The estimated age composition of immature chum salmon was 94.3% age 0.2 and the male to female ratio was 0.9 :1.0 (Tables 69 and 70).

Closure of the Shumagin Islands Section impacted about 40 to 50 purse seine permit holders and the vessels crew members, while the Otter Cove and Sanak Island Sections impacted about 9 purse seine permit holders and the vessels crews. In the Alaska Peninsula Management Area about 50% of the purse seine fishermen remained in port, and the remainder fished open areas.

Southeastern District

Southeastern District Mainland Fishery (SEDM)

Introduction

Although the SEDM fishery typically occurs from mid-June through mid-September the discussion of this fishery is included in the post June fisheries section of this report because most of the fishery occurs post June (Figures 4-6). The SEDM fishery is unique in many respects to other fisheries and has a management plan separate from the balance of the Alaska Peninsula (The Southeastern District Salmon Management Plan, Appendix A, 5 AAC 09.360).

Tables 71-83 contain data regarding the Southeastern District Mainland fishery.

The Southeastern District Salmon Management Plan covers the time period from June 1 (the beginning of the salmon season) through July 25 for fishing activity in the SEDM area of the Southeastern District (McCullough and Stopha 1992). This plan allocates a percentage of the Chignik sockeye salmon harvest in the SEDM fishery to Alaska Peninsula and Aleutian Islands Area M limited entry permit holders when specific biological and harvest criteria are met in Chignik. After July 25, when the management plan is no longer in effect, fishing periods through August are based on pink and chum salmon runs, while in September and October they are based on pink, chum, and coho salmon runs. The earliest date of the first landing from 1970-92 occurred on June 4, 1984 and the latest date of the last landing occurred on October 9, 1987.

The Southeastern District Mainland fishery includes Beaver Bay, Balboa Bay, Southwest Stepovak, Northwest Stepovak, Stepovak Flats, and East Stepovak Sections (Figure 5). Fishing effort during June and most of July is primarily targeted on Chignik destined sockeye salmon except in Orzinski Bay, where effort is targeted on the local Orzinski sockeye salmon run. Through July 25, the Southeastern District Salmon Management Plan is in effect (Appendix A). The management plan allocates seven percent of the total Chignik destined sockeye harvest to fishermen in the Southeastern District Mainland fishery. Besides the local sockeye salmon run at Orzinski Lake in the Northwest Stepovak Section there is an early July chum salmon run in the Stepovak Flats Section. Orzinski Bay and the Stepovak Flats Section are managed on a local stock basis throughout the season. After July 25, the entire area is managed for local stocks, primarily pink and chum salmon through August 31 and coho salmon in September.

During late-July through mid-August pink and chum salmon runs are peaking. The fishery is usually closed during mid-to-late-August to top off escapements and is opened again in September to harvest coho salmon. Sockeye salmon are moving through the area during the entire season.

Through July 25, as near as possible to seven percent of the total estimated Chignik destined sockeye catch is allowed to be taken in that portion of the Southeastern District Mainland located outside Orzinski Bay. However, if it appears that the Chignik Management Area sockeye catch will not reach 600,000 through July 25, then there will be no commercial fishery targeting Chignik sockeye in the Southeastern District Mainland or in the Cape Igvak Section of the Kodiak Management Area prior to July 26. No fishing targeting Chignik stocks in the Southeastern District Mainland or Cape Igvak fisheries is allowed until the run passing through those locations is assessed to be in excess of escapement requirements. The assessment is made by the Chignik Area Management Biologist.

The total Chignik destined sockeye catch is estimated by adding 80 percent of the Southeastern District Mainland (excluding the harvest in Orzinski Bay) catch to 80 percent of the Cape Igvak catch plus the entire Chignik Management Area sockeye catch.

The present management plan has evolved from allocation plans that were first used for the Southeastern District Mainland during the 1985 season. A similar plan has been used at Cape Igvak since 1978.

Historically, the Southeastern District Mainland fishery produced minor harvests. During 1974 through 1977, the fishery was open on a day to day basis with Chignik Lagoon. During some years, such as 1977 (when little fishing time was required to harvest large runs in Chignik Lagoon and daily interception rates in the Southeastern District Mainland area were low) the result was a disastrous season for Southeastern District Mainland fishermen.

For the 1978 season, the BOF allowed three fishing days per week in the Southeastern District Mainland fishery through July 10 and made set gillnets the only legal gear during that period. Interception rates were low despite strong Chignik runs and catches were poor for the few set gillnet fishermen in the Southeastern Mainland fishery. From 1970 through 1978, an average of 18 set gillnet permit holders participated in the fishery (Figure 31).

During the winter of 1978-79, the BOF increased fishing time to five days per week but specified that not more than 60,000 Chignik sockeye salmon could be taken through July 10. However,

the fishery could be closed if it became apparent that a closure was needed to assure the attainment of Chignik escapement requirements. Also, if the Chignik Management Area harvest exceeded 1,000,000 sockeye salmon before July 10, the Southeastern District Mainland fishery could continue beyond the 60,000 ceiling. This provision was a major reason for the record high harvest in 1984.

During 1979-82 Southeastern District Mainland fishers experienced good seasons even through closures were needed at times because of weak Chignik escapements. During this period, gear level increased to 31-41 (Figure 31).

In 1983, gear levels did not change drastically, but the fishery demonstrated an ability to catch large numbers of salmon during a short period of time when the July 7-8 total sockeye catch was about 49,000 salmon. The 1983 season was an outstanding one for Southeastern District Mainland fishermen with the season estimated interception of Chignik destined sockeye reaching 227,392 (Table 73). Most of the sockeye were taken between July 10 and August 10.

The 1984 season saw a dramatic increase of set gillnet gear, set gillnet permit holders totaled 57 (Figure 31). Several of the gillnet permit holders also held purse seine permits and fished gillnet gear only during part of the season. Consequently, there were about 43 full time set gillnet permit holders fishing. Due to the huge early Chignik run, the large number of these salmon available in the Southeastern District Mainland, and the large amount of gear, only six days were required to harvest 60,000 Chignik destined sockeye. However, the fishery was closed for only three days before the Chignik catch reached 1,000,000 salmon. The Southeastern District Mainland fishery was reopened on June 14 using the fishing periods listed in the regulation book (five days per week).

It was anticipated that the 1984 second Chignik sockeye run would be very strong. This later proved to be incorrect. The Chignik escapement goal was reached on the second run only after considerable curtailment of the Southeast Mainland, Chignik, and Cape Igvak (Kodiak Management Area) fisheries during mid-July. The 1984 Southeastern District Mainland interception of Chignik destined sockeye through July 25 was 423,068 salmon (Table 73).

The present management, described earlier, was adopted after the 1984 season. Since 1984, the management plan has remained the same, with two exceptions (after the 1991 season): 1) Orzinski Bay (instead of the entire Northwest Stepovak Section) is the only area managed for Orzinski sockeye salmon; and 2) the catch allocation of Chignik destined sockeye salmon has been increased from six to seven percent of the total Chignik catch.

The 1964-91 catch of Chignik destined sockeye salmon through July 25 has ranged from 4,485 salmon (0.88% of the total Chignik bound sockeye salmon catch) in 1984 to 423,068 salmon (12.64%) in 1984 (Table 75 and Figure 30). Both purse seine and set gillnet annual CFEC permits used in the fishery, as well as annual landings, have increased substantially since the early to mid-1970's (Figures 31 and 32). The 1983-92 annual CFEC permits used by purse seine permit holders average 28 and by set gillnet permit holders average 48. The 1983-92 annual purse seine landings average 63 and set gillnet landings average 604. Since 1970, the number of sockeye salmon caught by each gear type has varied considerably, the 1970-92 average catch by purse seine fishermen is 11.5% and by set gillnet fishermen is 88.5% (Figure 33).

Since 1985, when the original Southeastern District Management Plan was in effect, the harvest of Chignik destined sockeye salmon has ranged from 0.88% in 1989 to 8.88% in 1990 and averaged 6.4% (Tables 75 and 76). The 1988 and 1989 percentages were low due to the pre-July 26 Chignik Management Area sockeye harvest marginally reaching or failing to meet the 600,000 sockeye salmon harvest objective. In 1990, the catch of Chignik destined sockeye salmon through July 25 exceeded the six percent allocation because of large catches during the July 18-19 period, lower than anticipated harvests at Cape Igvak, and the difficulty of estimating the catching power of the fishing fleet, especially the purse seine fleet that has chilled fish tanks and hold fish for up to 48 hours before delivering.

In 1991, through July 25, the total sockeye salmon catch was 289,138. The estimated Chignik sockeye salmon contribution was 152,714 salmon (Table 75). This was the third largest catch of Chignik destined sockeye salmon on record. The large catch can be attributed to one of the largest early runs of Chignik sockeye salmon on record. The Southeastern District Mainland fishermen harvested about 6.3% of the total Chignik destined sockeye catch. The total catch in the Southeastern District Mainland fishery through July 25 was 328,624 salmon composed of 614 chinook, 289,727 sockeye, 1,386 coho, 24,788 pink, and 12,109 chum salmon (Shaul et al 1992). The catch in the Northwest Stepovak Section through July 25 was 98,834 salmon. Through 1991, sockeye caught in the Northwest Stepovak Section were considered to be local Orzinski salmon in accordance with the Southeastern District Management Plan.

In 1991, an additional 106,928 sockeye salmon were caught in the Southeast District Mainland (SEDM) between July 26 and September 13 (Shaul et al 1992). In 1991, the total catch for the Southeastern District Mainland fishery was 2,761,957 salmon consisting of 1,063 chinook, 396,655 sockeye, 50,102 coho, 2,119,216 pink, and 195,150 chum salmon.

In 1990, ADF&G installed a weir at Orzinski Lake (Shaul et al 1991). Since 1990, the sockeye escapement goal of 20,000 salmon has been met or exceeded, except in 1990 when the escapement was 15,000 sockeye salmon (Table 77). Chum and pink salmon escapements were very good to excellent while coho salmon surveys are incomplete (Shaul et al 1992).

Southeastern District Mainland 1992 Summary

Harvest numbers in the text are preliminary numbers received in season from tender reports which were used in the management of the fishery. Harvest numbers presented in tables are final, updated numbers from post season electronic fish ticket databases.

During November 1991, the BOF made changes to the Southeastern District Salmon Management Plan (ADF&G 1992 and McCullough and Stopha 1992). The major changes effecting the plan were: 1) the percentage of Chignik destined sockeye salmon permitted to be harvested in the SEDM was increased to seven percent, 2) the area where 80 percent of the sockeye salmon caught in the fishery are determined to be of Chignik origin was increased and now include the East Stepovak, Stepovak Flats, Northwest Stepovak (except Orzinski Bay; Figure 5), Southwest Stepovak, Balboa Bay, and Beaver Bay Sections, and 3) 100 percent of the sockeye salmon caught in Orzinski Bay were determined to be local (Orzinski Lake) sockeye and would not be included in the allocation. All other provisions of the management plan remained the same as in prior years.

The BOF during the November 1991 meeting also impacted the Southeast District Mainland fishery by closing most of the South Peninsula outside of the Southeast District Mainland to commercial salmon fishing from July 1-20 (Stopha, McCullough and Shaul 1992). BOF discussion of the post June fisheries noted the unique nature of the SEDM fishery from the balance of the South Peninsula. The BOF allowed terminal chum and pink salmon areas to be opened where local July pink and chum salmon could be harvested (Zachary Bay in the Shumagin Islands Section). One impact of the BOF decision closing most of the South Peninsula from July 1-20, while leaving other limited areas open was a concentration of fishing gear from July 1-20 in any area open to commercial fishing.

The SEDM management plan (modeled after the Kodiak, Cape Igvak Management Plan 5 AAC 18.360) contains unique features not found in the Cape Igvak Management Plan (ADF&G 1992 and Stopha, McCullough and Shaul 1992). The Southeast District Mainland is open to set gillnet gear only through midnight July 10; after July 10 the fishery is open to both set gillnet and purse seine gear. ADF&G attempts to achieve a seven percent harvest of Chignik bound sockeye

salmon in the Southeast District Mainland at midnight July 10 as well as a seven percent harvest at the conclusion of the management plan, July 25. Also unique to the SEDM are provisions for harvesting local chum salmon runs in the Stepovak Flats Section and local sockeye salmon in Orzinski Bay (Figure 5). A weir was installed at the outlet of Orzinski Lake in 1990 for the purpose of managing the fishery in proximity to the lake. In 1990, below desired sockeye escapement kept most of the Northwest Stepovak Section closed, while in 1991 escapements provided fishing time in excess to the balance of the SEDM. In 1992, only Orzinski Bay was managed by sockeye escapement counts into the lake; interim escapement goals were exceeded and Orzinski Bay was open for continuous salmon fishing from July 6 through August 2 (Tables 72, 82 and 83).

On July 10, 1992, in Superior Court of the State of Alaska the BOF post June salmon management plan for the South Alaska Peninsula (5 AAC 09.366) was dismissed by Superior Court Judge Hopwood and South Alaska Peninsula management returned to pre-1992 objectives, with a general South Peninsula commercial fishing period on July 13. Because of BOF action, court decisions, the weak Chignik second sockeye salmon run, and the June 30 to July 9 closure of the SEDM during the Chignik first and second runs overlap period there were no fishing periods in the SEDM from July 1 to July 12 that would have concentrated gear beyond normal expected gear levels (Tables 71 and 72). The only abnormal concentration of gear occurred in Orzinski Bay where a larger than expected return of sockeye to Orzinski Lake occurred. The larger than expected return of sockeye to Orzinski Lake may have been due to cape fisheries in the Shumagin Islands Section being closed from July 1-13.

The 1992 pre-season forecast for the total harvest of Chignik bound sockeye salmon was 1,400,000 salmon for the first (Black Lake) run and 650,000 salmon for the second (Chignik Lake) run (Quimby and Owen 1992). The forecast indicated that a fishery would occur in the Southeast District Mainland targeting Chignik bound sockeye salmon because one of the conditions of the management plan, a harvest of at least 600,000 would occur in the Chignik Management Area was predicted to be met.

As of 12:01 am, June 17 the sockeye escapement in Chignik was 109,201 salmon. The initial opening of the Chignik Management Area sockeye salmon fishery was at 5:00 am, June 17 for 24 hours. In Chignik, as of 4:00 pm, June 17 the commercial sockeye salmon catch in the Chignik Management Area was an estimated 150,000 salmon, indicating that the run was about as strong as forecasted. The fishing period in Chignik was extended in the evening of June 17 for an additional 24 hours, until 5:00 am, June 19.

The initial opening of the Cape Igvak Section of the Kodiak Management Area was for 24 hours starting at 12:01 am on June 19.

The first Southeast District Mainland commercial salmon fishing period was for 24 hours from 8:00 am, June 19 through 8:00 am, June 20, except Orzinski Bay which remained closed because no sockeye salmon had passed through the weir. The first period catch totaled 60 chinook, 31,843 sockeye, 0 coho, 2 pink, and 934 chum salmon for a total of 32,839 salmon from 83 set gillnet deliveries. The Southeast District Mainland interception of Chignik bound sockeye salmon was estimated at 25,474 salmon or about 10.1% of the total (Kodiak, Chignik, and Alaska Peninsula Management Areas) Chignik destined sockeye salmon harvest to date.

By 10 pm, June 24 the total commercial sockeye salmon catch in the Chignik Management Area was an estimated 250,000 salmon and Chignik Bay, Central, and Eastern District of the Chignik Management Area were opened until further notice. By June 24, the sockeye run appeared either weaker than forecasted (1.4 million sockeye harvest forecasted) or was considered to be running late.

The first salmon (205; Table 83) passed the Orzinski Lake weir on June 25 and as of 12:01 am June 25, the sockeye escapement in Chignik was 351,477 salmon.

The second Southeast District Mainland commercial salmon fishing period was for 24 hours beginning at 5:00 pm, June 26. The reported June 26 catch was 8 chinook, 10,047 sockeye, 0 coho, and 406 chum for a total of 10,047 salmon from 15 set gillnet deliveries. The estimated interception of Chignik destined sockeye through June 26 was 33,512 salmon or about 7.3% of the total Chignik destined sockeye salmon. The Orzinski Lake sockeye escapement through June 27 was 501 salmon (Table 82). The reported June 27 catch was 37 chinook, 40,740 sockeye, 5 coho, 51 pink, and 1,824 chum for a total of 42,657 salmon from 89 set gillnet deliveries. The Southeast District Mainland total catch through June 27 was 105 chinook, 82,630 sockeye, 5 coho, 66 pink, and 3,164 chum salmon for a total of 85,970 salmon from 187 set gillnet deliveries. The estimated Southeast District Mainland interception of Chignik destined sockeye through June 27 was 66,104 salmon or about 11.07% of the total Chignik destined sockeye salmon harvest. This was the first time since the Southeast District Mainland management plan has been in effect that fishing targeting Chignik destined sockeye salmon had been allowed in the Southeast District Mainland during the overlap period of the first and second Chignik sockeye salmon runs.

A third fishing period of ten hour duration on June 29 during the overlap period was established when an evaluation of the Chignik first run indicated escapement goals would be met and Chignik and Kodiak Management Areas continued to fish. Orzinski Bay also opened to commercial salmon fishing, the sockeye escapement through June 28 was 1,756 salmon (Table 82). The SEDM catch thorough June 29 was: 136 chinook, 112,152 sockeye, 9 coho, 96 pink, and 4,071 chum salmon from 253 set gillnet deliveries. The estimated Southeast District Mainland interception of Chignik destined sockeye was 88,945 salmon, or about 11.5% of the total Chignik destined sockeye salmon harvest through June 30.

Due to a weak Chignik second run, the SEDM remained closed until July 25, (the end of the management plan), except for those areas where periods are established by local runs. Orzinski Lake sockeye interim escapement goals were exceeded and Orzinski Bay opened to continuous commercial fishing from July 6 to August 2, during most of this period closed waters at the terminus of Orzinski River was reduced to the ocean shoreline (Appendix B). The Stepovak Flats Section of the Southeast District Mainland also has fishing periods established on the basis of local chum salmon runs through July 25. Sockeye salmon harvested in the Stepovak Flats Section are apportioned as 80% Chignik destined and 20% other. The Stepovak Flats Section opened to commercial salmon fishing for 40 hours beginning on July 13. Other general South Peninsula fishing periods of 40 hours on July 18 and July 23 included the Stepovak Flats Section.

Through July 25 the salmon harvest in the Southeastern District Mainland was 252,317 salmon, comprised of 170 chinook, 215,444 sockeye, 135 coho, 15,939 pink, and 20,629 chum salmon (Table 71). Through July 25, Orzinski Bay contributed 98,138 sockeye salmon to the SEDM fishery (Table 72). The total Chignik sockeye salmon contribution to the SEDM through July 25 was 93,845 salmon of which set gillnet gear harvested 99.7% (Figure 33). SEDM fishers harvested 7.15% (93,845 salmon) of the Chignik destined sockeye salmon harvest, Chignik fishers harvested 81.25% (1,066,732 salmon), and Cape Igvak fishers harvested 11.60% (152,358 salmon) (Tables 75 and 76).

Portions of the SEDM had several fishing periods concurrent with portions of the South Peninsula through August 13. The last period for Stepovak Flats occurred on July 27 through July 28, when the section was closed for the remainder of the salmon season by regulation (ADF&G 1992). The SEDM closed to commercial salmon fishing from August 14-31 to achieve late run pink and chum salmon escapements and early run coho salmon escapements.

The first post August (fall) fishery in the SEDM was from September 1-4. Catches were dominated by coho salmon with sockeye being the second most abundant species (Table 71).

Due to light effort and strong coho salmon catches the commercial fishing season was extended through October 30 with fishing periods being Monday through Friday.

October 6 was the last landing from the SEDM (Table 71). During the fall fishery (September 1 -October 6) the catch was 24,246 salmon comprised of 21 chinook, 9,080 sockeye, 12,513 coho, 338 pink, and 2,294 chum salmon (Table 71). The SEDM season total harvest was 1,484,106 salmon comprised of 631 chinook, 327,194 sockeye, 55,070 coho, 997,098 pink, and 104,757 chum salmon. Through October 6, Orzinski Bay contributed 105,050 sockeye salmon to the Southeast District Mainland fishery (Table 72). The Orzinski River sockeye salmon escapement was an estimated 25,000 salmon (Table 82). The Orzinski River escapement added with the Orzinski Bay catch indicates the total Orzinski Lake run in 1992 was 130,050 sockeye salmon (Table 77). The estimated age composition of the sockeye salmon escapement into Orzinski Lake was 23.8% age 1.2, 17.5% age 1.3, 22.4% age 2.2, and 30.3% age 2.3 (Table 81).

Assuming the Chignik contribution is 80% of the sockeye salmon harvested in the SEDM except for those salmon caught in Orzinski Bay the total Chignik sockeye salmon contribution to the Southeast District Mainland through the end of the season was estimated at 177,716 salmon. Set gillnet gear and purse seine gear were estimated to have harvested 80.7% and 19.3%, respectively, of the Chignik sockeye salmon in the Southeast District Mainland (Tables 74, 76, 78, and 80). For all sockeye salmon harvested in the SEDM (327,194 salmon) set gillnet gear harvested 86.8% and purse seine gear 13.2% (Table 80).

Shumagin Islands Section 1992 Summary

As discussed in earlier sections of this report, the BOF July 1-20 closure of most of the South Peninsula was over ruled by an injunction in Superior Court by Judge Hopwood. On July 10, ADF&G was directed by the court to establish commercial salmon fishing periods as in prior years. Test fishing prior to the July 13 opening indicated that immature salmon were not a concern (July 10 average immature per set was 58, July 11 average immature per set was 70). Accordingly, the first post June period was July 13-14, prior to July 13 only Zachary Bay in the Shumagin Islands Section had been open to commercial fishing. Both purse seine and set gillnet fishers participated in the opening (Table 64).

As discussed in the 1992 Immature Salmon Concerns Section of this report, immature salmon became a problem in the Shumagin Islands Section by July 15 (July 15 average immature per set was 301) and during subsequent fishing periods from July 17-28 only set gillnet gear was allowed. Test fishing on July 27 resulted in 92 immature salmon per set and purse seine gear

was allowed in those portions of the South Peninsula previously closed to seining due to the presence of immature salmon. ADF&G monitored the Shumagin Islands Section commercial fishery during the morning of July 28 and noted that the catch of immature salmon had increased to more than 100 immature salmon per set and purse seining was again closed in the Shumagin Islands Section (Appendix B). Test fishing continued and, by July 29, the catch of immature salmon had decreased to an acceptable level and purse seining was again allowed in all areas previously closed to seining due to the presence of immature salmon.

During August pink and chum salmon dominated the harvest (Figures 23 and 24). Commercial salmon fishing continued through August 22 when the Shumagin Islands Section was closed to achieve late run pink and chum salmon escapements and early run coho escapements.

The first post August (fall) fishery in the Shumagin Islands Section was during September 1-4. Catches were dominated by coho salmon with sockeye being the second most abundant species. Due to light effort and relatively strong coho salmon catches for early September, the commercial fishing season was extended through October 30, with fishing periods being Mondays through Fridays. The last landing occurred on September 25.

The post June Shumagin Islands Section total salmon harvest was 3,024,187 salmon comprised of 2,750 chinook, 252,526 sockeye, 233,709 coho, 2,296,809 pink, and 238,393 chum salmon (Table 87). During the fall fishery (September 1-25) the Shumagin Islands harvest was 20,375 salmon comprised of 37 chinook, 3,966 sockeye, 14,187 coho, 1,187 pink, and 998 chum salmon.

Post June annual CFEC permits in use and number of landings for both purse seine and set gillnet gear has increased in the Shumagin Islands Section since the early and mid-1970's. The 1983-92 average annual purse seine CFEC permits used was 72 and for set gillnet gear was 45 (Figure 26). The 1983-92 average annual number of landings by gear type was 716 for purse seine gear and 585 for set gillnet gear (Figure 27). The post June sockeye salmon catch by gear indicates an increasing harvest trend by set gillnet fishers with a corresponding decrease in the catch by purse seine fishers (Figure 28). Some of the increased sockeye salmon catch by gillnet fishers is the result of the Shumagin Islands being closed during part of July 1989-92 due to the presence of immature salmon. Catch statistics also indicate an increasing catch of coho salmon by set gillnet fishers, but the 1983-92 average post June coho salmon catch is dominated by purse seine fishers that have averaged 94.8% of the coho salmon harvest (Figure 29).

Southeastern District Summary

Post June catches of all species in the Southeastern District have increased since 1977 and averaged 4,021,004 salmon from 1983-92. Most of the increased catch is a result of strong pink salmon returns since 1977 (Table 84). The Southeastern District post June 1992 salmon harvest was 4,394,305 fish comprised of 3,248 (0.07%) chinook, 469,388 (10.68%) sockeye, 288,768 (6.57%) coho, 3,293,819 (74.96%) pink, and 339,082 (7.72%) chum salmon. During the fall fishery (September 1 - October 6) the Southeastern District harvest was 44,621 salmon comprised of 58 chinook, 13,046 sockeye, 26,700 coho, 1,525 pink, and 3,292 chum salmon. In 1992, most salmon except for sockeye salmon were harvested by purse seine fishers. In the Southeastern District, not counting test fishing landings, set gillnet fishers accounted for 1,858 (71.05%) landings as compared to 757 (28.95%) purse seine landings.

The Southeastern District estimated total escapement was 27,375 sockeye, 650 coho, 1,252,660 pink, and 224,399 chum salmon (Table 44; coho data are incomplete). The 1992 estimated escapements approximate the 1986-91 average estimated escapements of 28,252 sockeye, 10,190 coho, 844,406 pink, and 145,110 chum salmon (Murphy 1992). The indexed total escapement was 26,700 sockeye, 924,800 pink, and 83,500 chum (Tables 45-47). The indexed chum salmon escapement may be low due a lack of late season aerial surveys. Chum salmon escapements were spotty, some systems had good escapements while others were poor. Pink salmon escapements were good throughout the district. Sockeye escapements were also spotty, Orzinski Lake exceeded escapement goals while Acheredin Lakes' indexed sockeye escapement of 800 salmon was well below the goal of 5,800 to 11,600 salmon (Table 43). Estimated ages of the catches by fishery and species will be presented in Murphy (*in press*).

McGinty Point to Moss Cape Summary

Post June catches of all species in the McGinty Point to Moss Cape area (Figure 14) have increased substantially since 1975 and averaged 2,057,658 salmon from 1983-92 (Table 88). Most of the increased catch is the result of strong pink salmon returns since 1975. The McGinty Point to Moss Cape post June 1992 salmon harvest was 3,877,895 fish comprised of 755 (0.02%) chinook, 273,637 (7.06%) sockeye, 40,134 (1.03%) coho, 3,166,208 (81.65%) pink, and 397,161 (10.24%) chum salmon. In 1992, only 58 set gillnet landings (1.03% of all landings) occurred in the area, as compared with 699 purse seine landings (98.97%; Tables 89 and 90).

The McGinty Point to Moss Cape (McGinty Point through Nikolaski Spit and Dolgoi Island streams) estimated total escapement was 4,163 sockeye, 895,673 pink, and 170,142 chum salmon,

(Tables 43 and 44; coho data are incomplete). Indexed total escapements were 3,600 sockeye, 1,001,600 pink, and 142,700 chum salmon (Tables 45-47). Indexed pink escapements were strong throughout the area. Indexed chum escapements were spotty with an excellent escapement into Canoe Bay (98,500 salmon), fair escapements into Northwestern Pavlof Bay systems (10,000 salmon), fair escapements into Volcano Bay systems (32,100 salmon), and a poor escapement into Long John Lagoon (2,000 salmon). Estimated ages of the catches by fishery and species will be presented in Murphy (*in press*).

Belkofski to Kenmore Head Summary

Post June catches of all species in the Belkofski to Kenmore Head area (Figure 14) have increased since 1977, but have consistently averaged more than one million salmon only since 1988 (Table 91). The harvest in the Belkofski to Kenmore Head area has averaged 1,345,648 salmon from 1983-92. The 1992 post June salmon harvest was 2,618,015 fish comprised of 59 (0.0%) chinook, 70,369 (2.69%) sockeye, 14,794 (0.57%) coho, 2,428,144 (92.75%) pink, and 104,649 (4.0%) chum salmon. In 1992, there were 156 set gillnet landings (29.66% of all landings) and 370 purse seine landings (70.34%, Tables 92 and 93).

The Belkofski to Kenmore Head (Belkofski Village Creek through Charlie Hansen's Creek streams) estimated total escapement was 82,480 sockeye, 41,040 coho, 1,097,083 pink, and 130,413 chum salmon, (coho data are incomplete, Tables 43 and 44). Indexed total escapements were 56,200 sockeye, 707,800 pink, and 108,400 chum salmon (Tables 45-47). Indexed sockeye escapements were good. Indexed pink escapements were excellent throughout the area except for the Cold Bay Section where pink escapements were only fair. Indexed chum escapements were spotty. Estimated ages of the catches by fishery and species will be presented in Murphy (*in press*).

Kenmore Head to Scotch Cap Summary

Post June catches of all species in the Belkofski to Kenmore Head area (Figure 14) have increased since 1982 and have averaged 307,792 from 1983-92 (Table 94). The 1992 post June salmon harvest was 416,497 fish comprised of: 71 (0.02%) chinook, 59,513 (14.29%) sockeye, 74,521 (17.89%) coho, 238,779 (57.33%) pink, and 43,613 (10.47%) chum salmon. In 1992, there were 72 set gillnet landings (17.18% of all landings), 35 purse seine landings (8.35%), and 312 drift gillnet landings (74.46%; Tables 95-97).

The Kenmore Head to Scotch Cap (Deadman's Cove Creek through Lazaref River and Sanak Island streams) estimated total escapement was 6,400 sockeye, 243,060 pink, and 1,020 chum salmon, (Tables 43 and 44; coho data are incomplete). Indexed total escapements were 11,00 sockeye, 200,200 pink, and 900 chum salmon (Tables 45-47). Due to limited surveys the sockeye salmon indexed escapement is probably low. Estimated ages of the catches by fishery and species will be presented in Murphy (*in press*).

South Peninsula Post June Summary

Since 1970, post June catches of all species in the South Peninsula have ranged from 88,838 salmon in 1975 to 12,748,353 in 1984 and averaged 7,755,565 salmon from 1983-92 (Table 93). Catches have been more than one million salmon since 1970 except for years 1972-75. The 1992 post June salmon harvest was 11,306,712 fish comprised of: 4,133 (0.04%) chinook, 872,907 (7.72%) sockeye, 418,217 (3.70%) coho, 9,126,950 (80.72%) pink, and 884,505 (7.82%) chum salmon. In 1992, there were 2,144 set gillnet landings (49.66% of all landings), 1,861 purse seine landings (43.11%), and 312 drift gillnet landings (7.23%; Tables 99-101).

The 1992 South Peninsula indexed total escapement was 3,267,500 salmon comprised of: 97,600 sockeye, 2,834,400 pink, and 335,500 chum salmon (Tables 45-47). No chinook spawn in South Peninsula waters and total coho salmon escapement data are not collected annually. The sockeye indexed escapement was the second largest since at least 1962, exceeded only by the 1991 escapement. The pink salmon escapement was the third largest since 1962, being exceeded only by the 1984 and 1991 escapements. The chum indexed escapement was well below the previous 10 year average of 456,400 salmon. Using the indexed total escapement and only post June salmon catches, the South Peninsula pink salmon run was estimated as 12,103,600 salmon and the chum salmon run was estimated as 1,226,100 salmon (Tables 41 and 46). The 1992 indexed total sockeye salmon escapement was about 31,000 salmon greater than the 1982-91 average of 67,000 salmon (Table 45). Orzinski and Thin Point Lakes were the primary production areas of local sockeye stocks. Although complete coho salmon escapement data were not collected in 1992, 15,000 coho salmon were observed in Thin Point Lagoon, an unusually high escapement for that system (Table 43). The 1992 indexed total escapement of pink salmon was about 351,000 salmon more than the 1980-90 even year average of 2,483,000 salmon. Except for isolated locations, excellent pink salmon escapements were attained throughout the South Peninsula streams. The 1992 indexed total chum salmon escapement was about 160,000 salmon less than the 1982-91 average of 495,000 salmon. Escapements were spotty and ranged from poor to excellent. When large pink salmon runs occur the intensive effort usually causes chum salmon stocks to be over harvested where the species mix.

Using expansion factors for sockeye and coho salmon and the area-under-the-curve method (Johnson and Barrett 1988) to determine pink and chum salmon escapements, the South Peninsula estimated total escapement was 120,418 sockeye, 41,690 coho, 3,488,476 pink, and 525,974 chum salmon (Tables 43 and 44; coho escapement data is incomplete due to the late timing of the runs). The 1992 estimated total sockeye escapement was about 17,000 salmon greater than the 1986-91 average of 103,978 salmon (Murphy 1992). The estimated total pink salmon escapement was about 856,000 salmon greater than the 1986-91 average (2,632,554 salmon) and the chum salmon estimate was about 28,000 salmon less than the average (553,893).

ALEUTIAN ISLANDS AND ATKA-AMLIA MANAGEMENT AREAS

Introduction

The Aleutian Islands Area produces runs of sockeye, coho, pink, and chum salmon. However, only pink salmon have proven to be of major commercial importance. The following islands produce large pink salmon runs during some years: Unalaska; Atka; Umnak; Adak; Amlia; and Attu. Tanaga, Kanaga, and Kiska Islands all have at least one important pink salmon stream. Except for occasional fishing on Umnak Island during the early 1960's and, probably, the 1950's, and Attu in 1963, all commercial effort has been confined to Unalaska Island.

Aleutian Islands pink salmon runs tend to be much larger during the even year cycle (Table 1). Unalaska Bay has a history of producing large runs during both odd and even years. The record Aleutian pink salmon catch was approximately 2.6 million fish during 1980 (roughly 2 million were taken out of Makushin Bay alone). Pink salmon runs are very unstable in the Aleutians. They produce legendary high returns at times and then collapse for no apparent reason. Aleutian pink and sockeye salmon tend to be of smaller size at a given age than those of Alaska Peninsula stocks.

Prior to 1979, markets were a limiting factor at Unalaska. There was often no market unless pink salmon abundance warranted sending tenders from False Pass or King Cove. Some fish (usually sockeye salmon) were salted by the fishermen. From 1979 to the present, most fish have been processed by buyers at Unalaska-Dutch Harbor or Akutan.

A total of 13 sockeye, 14 coho, 103 pink and 8 chum salmon producing streams have been identified on Atka and Amlia Islands (Murphy 1992). In the Aleutian Islands, not including

Atka, Amlia, and Unimak islands, a total of 32 sockeye, 21 coho, 216 pink, and 3 chum salmon producing streams have been identified (Murphy 1992).

Unalaska pink salmon runs seem to arrive about the same time as those of the South Peninsula. However there is considerable variation from year to year as to when pink salmon enter Unalaska streams as well as timing between various streams. This is a different situation than found on the South Peninsula where pink salmon entry into streams is less variable. During large runs Unalaska pink salmon may trickle in throughout September.

During the winter of 1991-92, the BOF created the Atka-Amlia Islands Area which is open to entry for set gillnet gear. Alaska Peninsula-Aleutian Islands (Area M) seiners may still seine for salmon in the Atka-Amlia Islands Area, although there is no record of seining at Atka and Amlia. The regulations are listed in Appendix A. A separate detailed management report concerning the Atka-Amlia Management Area will be authored by Holmes and Campbell (*in press*).

Aleutian Islands 1992 Summary

In 1992, the Unalaska salmon harvest totaled 3,082 sockeye salmon, 312,072 pink salmon and 1,230 chum salmon (Table 2). The entire harvest came from the Makushin Bay Section, with only four vessels participating. Pink salmon escapements were generally poor in Unalaska Bay. Makushin Bay escapements were fair. Pink salmon escapements into Iliulik Creek (Town Creek at Unalaska) and the Kashega system were good while those of non lake systems were poor or fair (Tables 101 and 103).

As was the case with much of Unalaska Islands pink salmon runs, those of the Atka-Amlia Islands Area were disappointing (Tables 104 and 105). Escapements of pink salmon were poor compared to those observed on Atka Island during the 1982 Aleutian Islands survey. The Atka-Amlia harvest (all by set gillnet) totaled 231 sockeye, 42 coho, 7,972 pink and 308 chum salmon (Table 2). Thirteen units of set gillnet gear operated at Atka during 1992. All fishermen were local or from the Pribilof Islands. Nearly all of the harvest came from locations close to Atka village.

In order to give fishers a better opportunity to harvest pink salmon in remote locations, continuous fishing time was allowed outside of Nazan Bay and Korovinski Lagoon during August 17-31 (Appendix B.2). Also, effective 12:01 a.m. August 17, the closed waters in the northwestern stream in Nazan Bay was expanded to 1,000 yards from the stream terminus. Atka

fishermen have small skiffs and no tender service. Consequently, in view of the often high winds and dangerous tide conditions, virtually no catches were reported from remote locations.

SUBSISTENCE SALMON FISHERIES

Subsistence salmon catches are estimated from permit return information. Information from returned permits are used to extrapolate catches for all permits issued. There are undoubtedly many fish kept from commercial catches that are not reported. Permits are not required to subsistence fish in the Akutan and Umnak Districts; consequently no catch estimates are made by the Commercial Fisheries Division for those districts.

Subsistence salmon fishing is not allowed in the Adak District. However a personal use salmon fishery is allowed on Adak and Kagalaska Islands for Alaska residents and military personnel (and their dependents) who have been stationed in Alaska for the preceding 12 months.

Subsistence and personal use catch information is presented in Tables 106-115.

The subsistence salmon harvest in the Alaska Peninsula and Unalaska Island communities continues to gradually increase (Table 106). Alaska Peninsula data collected since 1985, indicates that the 1985-91 average catch of 14,595 salmon is mostly sockeye (6,584) and coho (4,580) salmon. In 1992, the Alaska Peninsula sockeye salmon catch was almost 2,000 salmon less than the 1991 harvest, but was about 1,400 salmon more than the 1985-91 average. In the Unalaska area the number of permits issued and the catch of sockeye and pink salmon continues to increase. In 1992, 144 permits were issued in the Unalaska area almost as many as the 176 permits issued in the Alaska Peninsula area.

The Mortensens Lagoon subsistence fishery seems to be attracting more out of area Alaska residents (primarily from Anchorage and the Matanuska-Susitna Valley) each year. In 1992, 18 of the 34 permits issued were to out of area residents (Table 109).

The Adak-Kagalaska Islands personal use salmon harvest primarily consists of sockeye taken at Quail Bay on Kagalaska Island and Hidden Bay on the south side of Adak Island. A few pink and coho salmon are harvested on the north side of Adak Island. In 1992, the estimated Adak-Kagalaska harvest was 572 sockeye, 30 coho, and 4 pink salmon (Table 114).

MISCELLANEOUS ACTIVITY OR OBSERVATIONS

In 1992, Russell Creek Hatchery did not operate. All ADF&G personnel were transferred to other locations or terminated. The Aleutians East Borough hired Bill Ambridge, former ADF&G maintenance man to be caretaker of the hatchery during the winter of 1992-93. It is not known at this time whether the Aleutians East Borough or any other organization will operate the hatchery in the future.

Dexter Lall, who was the Alaska Peninsula and Aleutian Islands Areas Management Biologist during 1960-61, retired in December 1992 from his position as plant manager of Peter Pan Seafoods, Inc. at Port Moller. Mr. Lall was plant manager at Port Moller during 1981-92.

Denby Lloyd resigned his position as Director of the Commercial Fisheries Division to become Resource Specialist for the Aleutians East Borough.

A new dock was constructed at False Pass and the state ferry is scheduled to add False Pass to their ports of call in 1993.

The Stellers sea lion population in the Bering Sea and Western Gulf of Alaska continues to decline. The fur seal and harbor seal populations also are declining in the Bering Sea and Western Gulf.

The lower Alaska Peninsula and Unimak caribou herds still remain at low levels. The upper Alaska Peninsula herd is stable at a healthy level.

Willow ptarmigan were abundant in the vicinity of Cold Bay and appeared to be at the highest level since at least 1979. However, the ptarmigan population at Port Moller and Sand Point apparently declined substantially from the 1991 level.

Crowberries and strawberries were abundant at Cold Bay during 1992. Salmon berries and blue berries were moderately abundant. Salmon berries were reported to be scarce in Sand Point and other locations.

Construction continued on the new Sand Point runway.

Table 7. (page 6 of 6)

- a Permanent salmon weeks are the 1987 statistical weeks and will be used every year beginning in 1990. Previously, differences in statistical weeks between years made much of the data uncomparable.
- b The weeks listed here do not necessarily include the entire week. A complete list of permanent statistical weeks is at the end of the report.
- c Catches for the entire South Peninsula, North Peninsula, Aleutian Islands Area, and Atka-Amlia Areas are rounded to the nearest thousand by week, consequently the totals may be slightly in error. Shumagin Islands test fishing catches are included in this table.

Table 31. Salmon escapement survey counts in the North Peninsula, 1992.

Stream Number	Stream Name/Location	Date	Survey Conditions	Species					Observer	Remarks ^{a, b}
				Chinook	Sockeye	Coho	Pink	Chum		
NORTHWESTERN DISTRICT										
311-20.15	Tugumak River	Not Surveyed								
311-30.06	Divide Creek	03-Aug	Good	0	500	0	0	0	Shaul	500 chum in lower end of outlet channel.
311-30.05	Unnamed	Not Surveyed								
311-30.07	Whaleback	19-Jun	Poor	0	200	0	0	0	Shaul	Poor survey, but no large numbers of fish. Cherokee survey.
		02-Jul	Poor	0	4,000	0	0	0	Shaul	1,000 sockeye in lake, rest in channel. Poor visibility due to muddy water coming out of the creek.
		14-Jul	Good	0	11,500	0	0	0	Shaul	2,000 sockeye in the lake, 500 sockeye in the creek, with balance in the channel. Good showing in the lower end.
		24-Jul	Poor	0	25,000	0	0	0	Shaul	jumpers in deep. 14,000 sockeye in the creek, and 10,000 in the outlet channel; fish still coming in. Windy on lake; saw 1,000 probably more.
		03-Aug	Good	0	26,300	0	0	0	Shaul	17,300 sockeye in creek, only 4,000 on spawning grounds. Additional 4,000 were in outlet channel, and 5,000 in lagoon.
311-30.08	Christianson	03-Aug	Good	0	1,200	0	0	0	Shaul	500 sockeye were in spawning areas.
311-30.09	Mudhole	02-Jul	Good	0	0	0	0	300	Shaul	1,200 chums on flats, may have been more, water choppy. 500 sockeye, and 3,000 chums on flats near 30.09. Additional 7,000 chums in outlet channel. 100 sockeye, and 1,500 chums in western portion of lagoon, nothing in the outlet channel.
		14-Jul	Poor	0	0	0	0	700	Shaul	
		24-Jul	Good	0	0	0	0	1,200	Shaul	
		03-Aug	Good	0	0	0	0	5,000	Shaul	
311-30.10	Clear Lagoon	02-Jul	Good	0	0	0	0	0	Shaul	300 chums on the flats.
		14-Jul	Good	0	0	0	0	200	Shaul	400 sockeye, and 1,000 chums on the flats.
		24-Jul	Good	0	0	0	0	300	Shaul	2,000 sockeye, and 400 chums on the flats near 30.10. 7,000 chums in outlet channel.
		03-Aug	Good	0	500	0	0	2,000	Shaul	2,200 sockeye were in the eastern part of the lagoon.
311-40.01	Emil's River	03-Aug	Good	0	50	0	0	0	Shaul	2,000-3,000 Dolly Varden.
311-40.04	North Creek	Not Surveyed								
311-50.01	Big River	25-Aug	Good	0	0	0	0	700	Shaul	Surveyed spawning tributary.

Table 32. (page 7 of 7)

Notes: Escapement determined from spawner abundance curves derived from aerial escapement surveys under fair or better visibility conditions and an assumed, 7 day average stream life for chum salmon in Swanson Lagoon, and a 15 day average stream life for all other chum and pink salmon. Where peak counts were greater than the calculated escapement, the peak count was expanded by 1.7 for chum salmon, and 1.8 for pink salmon. The expansion factors were determined by using the ratio of peak count to total estimated escapement where ascending, peak count, and descending counts were available.

Chinook estimated total escapement (peak x 1.92), sockeye (peak x 1.25 for Whaleback Mountain Creek, Swanson Lagoon, Moffet Creek, North Creek, David's River, Grass Valley, Mudhole, Clear Lagoon, and Sandy Lake, and peak x 2.0 for other streams), and coho (peak x 2.4).

Chum and pink salmon calculated using a 15 day stream life, where peak counts were greater than the calculated escapement the peak count was expanded by 1.9198 (determined by using the ratio of peak count to total estimated escapement where ascending, peak count, and descending counts were available).

Chinook estimated total escapement (peak x 1.92), sockeye (peak x 1.25; clear streams and peak x 2.0; other streams), coho (peak x 2.4). Escapement determined from spawner abundance curves derived from aerial escapement surveys under fair or better visibility conditions and as assumed, 7 day average stream life for chum salmon in Swanson Lagoon, and a 15 day average stream life for all other chum and pink salmon. The peak count was used in instances when the peak count exceeded the computed estimate.

A zero indicates no fish were present while a blank indicates no fish of that species were observed.

Sockeye escapements were determined by an expansion faactor of 1.25 for Whaleback Mountain Creek, Swanson Lagoon, Moffet Creek, North Creek, David's River, Grass Valley, Sandy Lake, Mudhole, and Clear Lagoon. All other sockeye escapements were determined by an expansion factor of 2.0.

Table 33. Indexed total escapement of sockeye salmon in some North Peninsula systems, in thousands of fish, 1992.

^aYears Ocean River emptied into Ilnik Lagoon.

^bYears Ocean River emptied directly into Bering Sea.

^cYears when it is not known as to where Ocean River emptied.

Table 34. Indexed total escapement of chum salmon in some major North Peninsula production locations, in thousands of fish, 1992.

Year	Frank's Lagoon	Moller Bay	Herendeen Bay	Nelson Lagoon	Moffett Bay	Izembek Bay	St. Catherine Cove

^a See Orzinski (Orzenoi) Lake weir counts and total escapement; the highest daily weir count was used for the peak count.

A fifteen day average stream life was used for all pink and chum salmon escapements.

For all pink and chum salmon escapements with only a peak count or where the computed value was less than the peak count, an expansion factor of 1.8 was used for pink salmon, and 1.7 for chum salmon. The values were derived from the ratio of peak count to total estimated escapement for streams where ascending, peak count, and descending counts were available.

Sockeye salmon escapements were estimated by an expansion factor of 1.25 for Acheredin Lake, Baralof Bay, and Mino Creek. All other sockeye salmon escapements were estimated by an expansion factor of 2.0. Coho salmon escapements were estimated by an expansion factor of 2.4.

Table 45. South Peninsula sockeye indexed total escapements by section, 1962-1992^a.

^a Figures in parenthesis are extrapolated estimates

^b Bechevin Bay is considered part of the North Peninsula.

^c Includes Sanak Island, which accounted for 15,500, 5,400, and 5,700 during 1985, 1986 and 1990 respectively.

	Total	3	3,602	0	884	1,098	5,587	3.3 : 1.0

June 9: The average weight of sockeye salmon was 3.5 to 4 pounds.

June 10: Sets were only 12 minutes instead of the normal 20 minutes because all salmon were given away as subsistence fish. Only 2 sets were made due to a large ocean swell at Popof Head. Pink salmon size is large with many over 3 pounds.

June 11: Sockeye salmon range in weight from 2 to 7 pounds, chum from 3 to 12 pounds, and pink from 1.5 to 4 pounds.

June 12: Exact counts of adult pink salmon per set were not taken. A whale went through the net on the second set and made a large hole. Many of the chum salmon were water marked, their size ranged from 4 to 12 pounds. The average size of pink salmon seems to be smaller than in previous days.

June 13: Chum salmon size ranged from 2 to 10 pounds, with some salmon water marked and others were ocean bright, some pink were also beginning to water mark.

Table 49. South Unimak and Shumagin Islands June fishery regulation history, 1962-1992.

Year	South Unimak	Shumagin Islands
1962-66	5 days per week	5 days per week
1967-70	7 days per week	7 days per week
1971-72	6:00 A.M. Monday - 6:00 A.M. Saturday	7 days per week
1973	*Four 13 hour fishing periods per week	*Four 13 hour fishing periods per week.
	* Both fisheries were closed by emergency order during June 25-28 due to indications of the Bristol Bay run being below escapement requirements.	
1974	No fishery	No fishery
1975-83	*6.8% of predicted Bristol Bay catch	1.5% of predicted Bristol Bay catch
1984-89	No more than 96 hours per 7 day period and no more than 72 hours of consecutive fishing time in each fishery (windows).	
1986	*6.8% allocation minus June 26-30 segment Windows No fishing before June 11	1.5% allocation minus June 26-30 segment Windows No fishing before June 11
	A 400,000 chum salmon ceiling placed on both fisheries combined.	
1987	*Same as during 1984-85 for both fisheries.	
1988-89	*6.8 of predicted Bristol Bay catch Windows	1.5% of predicted Bristol Bay catch Windows
	A 500,000 chum salmon ceiling placed on both fisheries combined.

^a During the peak of the South Unimak-Shumagin Islands Section June fishery (June 12-25), approximately 30 - 40 seiners fish the Shumagin Islands Section. During the few occasions when South Unimak is open and the Shumagin Islands Section closed, nearly the entire purse seine fleet is at Unimak. Drift net effort declines after June 20 as the fleet begins moving to Port Moller.

^a The figures below were calculated by adding the actual Bristol Bay sockeye harvest and the South Unimak-Shumagin Islands June sockeye harvest together and determining or applying the appropriate percentages. The calculations are slightly high as not all sockeye caught at South Unimak and the Shumagin Islands are destined for Bristol Bay.

^b 1980 Bristol Bay sockeye catch would have been much larger had it not been for a lengthy strike.

^c These sockeye allocations were not reached largely, if not totally, due to a chum cap.

^d Bristol Bay catch figures are preliminary.

Table 64. (page 3 of 3)

-
- July 10: No immature jumpers observed, many pollock gilled at Red Bluff. Many mature, bullet shaped chum salmon, approximately 3 to 4 pounds were gilled with the smaller immature salmon.
- July 11: Several bullet shaped mature chum salmon weighing about 3 pounds were gilled during each set, these were not counted as immature salmon.
- July 15: No immature jumpers were observed. During the set that caught most of the immature salmon, most were caught in a 50 fathom length net during the tide change.
- July 16: Immature jumpers were observed during all sets.
- July 17: Unusual abundance of immature chinook salmon. Immature chinook and sockeye salmon were about the same size, chum salmon were somewhat larger.
- July 19: While few immature salmon were caught at Kelly Rock and Red Bluff these sites also produced the fewest mature salmon.
- July 20: High winds and ocean swell prevented test fishing.
- July 21 & 22: Many immature jumpers were observed at Popof Head.
- July 25: The second set was for 10 minutes, other sets were 20 minutes.
- July 26: Rough seas prevented test fishing at Popof Head.
- July 27: Many adult coho and pink salmon jumpers observed, also caught 1, 5 pound steelhead.
- July 29: With the Shumagin Islands Section opening to commercial fishing on short notice the skipper wanted to remain out on the grounds; the adult salmon were estimated and given to the fishermen in exchange for the charter costs.

From 1970-91, the Chignik contribution is 80% of the sockeye salmon harvested in Beaver Bay, Balboa Bay, Southwest Stepovak, Stepovak Flats and East Stepovak Sections.

In 1992, the Chignik contribution is 80% of the sockeye salmon harvested in the Southeastern District Mainland fishery except Orzinski Bay where 100% of the sockeye salmon are considered local production.

Table 74. Chignik sockeye salmon contribution to the Southeastern District Mainland harvest, by gear, for the entire season, 1970-92.

1992 ^j	1,066,732	81.25	152,358	11.60	93,845	7.15	1,312,935

^a The Cape Igvak and Southeast District Mainland figures represent 80% of the total sockeye catches for those areas as it is estimated that roughly 80% of the sockeye caught in the Cape Igvak section and Southeast District Mainland area (excluding sockeye caught in the Northwest Stepovak Section from 1964-1991, and in Orzinski Bay in 1992) are destined for Chignik.

^b The data from 1964-1972 are based on total yearly catches. Prior to 1973, Cape Igvak and Southeast District Mainland fisheries were set by regulation to weekly fishing periods, usually 5 days per week. Time modifications were implemented when poor escapements occurred at Chignik.

-Continued-

Table 75. (page 2 of 2)

-
- c Catches (1970-92) were updated using historical electronic fish ticket databases.
 - d During 1973-1977 all three fisheries were managed on a day by day basis.
 - e From 1978-1992, the Cape Igvak Fishery Management Plan allocated 15 percent of the total sockeye catch destined for Chignik.
 - f During 1978, seining prior to July 11 was disallowed in the Southeast District Mainland. The set gill net fishery was allowed to fish 3 days per week through July 10 after which the fishery was managed on the basis of local stocks.
 - g During 1979-1984 and prior to July 11, fishing was allowed 5 days per week in the Southeast District Mainland area with a ceiling of 60,000 estimated Chignik destined sockeye salmon. If the Chignik Area sockeye catch was 1,000,000 or more before July 11, the 60,000 ceiling was to be dropped.
 - h Beginning in 1985, Southeast District Mainland area (excluding the Northwest Stepovak Section from 1964-1991 and exclusive of Orzinski Bay only in 1992) was placed on an allocation of 6.2 percent of the total estimated Chignik sockeye catch through July 25. After July 25, the Southeast District Mainland is managed on a local stock basis. The allocation changed to 6.0 percent beginning in 1988. Seining is still not allowed prior to July 11.
 - i Includes overescapement of 278,305 sockeye counted past the weir during the Chignik Area seiners' boycott (June 23 - July 4).
 - j Review of Orzinski Lake historical and current escapement records led the Alaska Board of Fisheries to redefine the Southeast District Management Plan. Beginning in 1992, the Southeast District Mainland fishery exclusive of Orzinski Bay was placed on an allocation of 7.0 percent of the total estimated Chignik destined sockeye salmon catch through July 25.
-

1992	25,000 ^d	105,050 ^e	23,539	128,589	130,050 ^g	327,194

^a Weir was used to count escapement.

^b In 1938, adverse weather conditions may have caused only part of the run to be counted.

^c Escapement counts are indexed total escapements and are likely lower than the actual total.

^d Escapement count is the sum of weir counts plus aerial surveys conducted after the weir was removed.

^e Catch number is for Orzinski Bay only.

^f The total Orzinski run is escapement plus total Suzy Creek to Dent Point catch.

^g The total Orzinski run is escapement plus Orzinski Bay catch.

Table 78. (page 2 of 2)

Date	Total Catch	Chignik Contribution	Cumulative Chignik Catch	Percent of Total
Total	222,144	177,715	177,715	100.0

Set gillnet gear only is allowed prior to July 11.

The Chignik contribution assumes 80% of the sockeye catch through the entire season in the Southeastern District Mainland fishery, exclusive of Orzinski Bay, is destined for Chignik.

Catch through July 25, was 93,845 salmon (52.8%) of the season total Chignik destined sockeye salmon harvest.

Table 79. Southeastern District Mainland sockeye salmon catch, by gear, through July 25, 1970-1992.

Year	Catch by Gear				Total Catch

All surveys were on foot unless otherwise noted in the remarks.

A fifteen day average stream life was used for all pink and chum salmon escapements.

For all pink and chum salmon escapements with only a peak count or where the computed value was less than the peak count, an expansion factor of 1.65 was used for pink salmon, and 1.7 for chum salmon. The values were derived from the ratio of peak count to total estimated escapement for streams where ascending, peak count, and descending counts are available.

Table 105. Peak and estimated total salmon escapement by district, species, and stream for the Atka-Amlia Management Area, 1992.

Table 109. Mortensen's Lagoon subsistence and commercial sockeye and coho salmon harvests, 1992^a.

	Estimated Permits	Sockeye	Coho
Cold Bay Residents	15	336	38
King Cove Residents	1	0	20
Out of Area Residents	18	515	46
Total	34	851	104

^a The number of permit holders and the number of fish caught are extrapolated from returned permits.

	Boats	Sockeye	Coho
Commercial Harvest ^b	6	371	140

^b The commercial harvest includes all of statistical area 284-62 (formerly 283-32), some of the fish may have been destined for systems other than Mortensen's Lagoon.

Escapements	
Sockeye (Indexed Total)	Coho
9,100	-

Table 110. Thin Point Cove subsistence and commercial sockeye and coho salmon harvests, 1992.

Fishery	Permit Holders	Sockeye	Coho
<i>Subsistence</i> ^a	23	547	927
<i>Commercial</i> ^b	16	30,356	8,906
Total Harvest		30,903	9,833

^a The number of subsistence permit holders fishing Thin Point Cove and the number of fish caught are extrapolated from permit returns. All subsistence fishermen fishing Thin Point Cove during 1992 are all estimated to be King Cove residents, except one non local resident.

^b The commercial information came from fish tickets.

The indexed total sockeye escapement was 32,600. This figure is probably close to but less than the actual figure. The peak coho estimate was 15,000.

Table 111. Reese Bay (Unalaska Island) subsistence salmon harvest, 1992.

Estimated Permits ^a	Sockeye ^b	Coho	Pinks
59	2,479	0	0

^a The number of permit holders and number of fish caught are extrapolated from returned permits.

^b The sockeye escapement (one survey August 15) was estimated to be approximately 6,000.

APPENDIX

APPENDIX A: LISTING OF SALMON REGULATIONS, 1992.

Appendix A.1. Alaska Peninsula Management Area salmon regulations, 1992.

CHAPTER 09. - ALASKA PENINSULA AREA

ARTICLE 1. - DESCRIPTION OF AREA.

5 AAC 09.001. APPLICATION OF THIS CHAPTER. Requirements set forth in this chapter apply to commercial fishing only, unless otherwise specified. Subsistence fishing regulations affecting commercial fishing vessels or affecting any other commercial fishing activity are set forth in the subsistence fishing regulations in 5 AAC 01 and 5 AAC 02.

5 AAC 09.100. DESCRIPTION OF AREA. The Alaska Peninsula Area includes all waters of Alaska from Cape Menshikof to Cape Sarichef Light and from a line extending from Scotch Cap through the easternmost tip of Ugamak Island to a line extending 135° southeast from Kupreanof Point.

ARTICLE 2. FISHING DISTRICTS AND SECTIONS.

5 AAC 09.200. FISHING DISTRICTS AND SECTIONS. (a) The Northern District includes all waters on the north (Bering Sea) side of the Alaska Peninsula between the westernmost tip of Cape Menshikof and the southernmost tip of Moffet Point:

(1) Cinder River Section: All waters of the Northern District east of 158°20' W. long.;

(2) Port Heiden Sections:

(A) Outer Port Heiden Section: all waters of the Northern District located between 158°20' W. long. and the longitude of Strogonof Point (158°51' W. long), exclusive of the Inner Port Heiden Section;

(B) Inner Port Heiden Section: all waters of Port Heiden Bay south and east of a line from Strogonof Point at 56°53'16" N. lat., 158°50'36" W. long. to the mainland shore of the northeast entrance to the bay at 56°56'31" N. lat., 158°40'44" W. long.;

(3) Ilnik Section: all waters between the longitude of Strogonof Point (158°51' W. long.) and the longitude of Three Hills (159°50' W. long.);

(4) Three Hills Section: all waters between the longitude of Three Hills (159°50' W. long.) and the longitude of Cape Seniavin Light (160°09' W. long.);

(5) Bear River Section: all waters between the longitude of Cape Seniavin Light (160°09' W. long.) and the longitude of Wolf Point (160°48'30" W. long.), excluding the waters of the Herendeen-Moller Bay Section;

(6) Herendeen-Moller Bay Section: all waters south of a line extending from Entrance Point to Wolf Point to Point Edward on Cape Rozhnof;

(7) Nelson Lagoon Section: all waters of Nelson Lagoon inside the bars and inside a line extending from Lagoon Point to Wolf Point to Point Edward on Cape Rozhnof;

(8) Caribou Flats Section: all waters between Wolf Point and a point at 55°53'40" N. lat., 161°49' W. long., approximately 22 nautical miles west of Nelson Lagoon Village and exclusive of the waters comprising the Nelson Lagoon section;

(9) Black Hills Section: all waters between 55°53'40" N. lat., 161°49' W. long., and Moffet Point.

Appendix A.1. (page 2 of 15)

(b) The Northwestern District: all waters on the north (Bering Sea) side of the Alaska Peninsula between Moffet Point and Cape Sarichef Light on Unimak Island, including Bechevin Bay and the waters of Isanotski Strait north of a line from the False Pass cannery dock to Nichols Point.

(1) Izembek-Moffet Bay Section: all waters between Moffet Point and Cape Galazenap;

(2) Bechevin Bay Section: all waters between Cape Galazenap and Chunak Point, including Bechevin Bay and the waters of Isanotski Strait north of a line from the False Pass cannery dock to Nichols Point;

(3) Swanson Lagoon Section: all waters on the north side of Unimak Island between the easternmost edge of Chunak Point (55°02' N. lat., 163°27' W. long.) and east of the longitude of Otter Point (163°47' W. long.), excluding the waters of the Bechevin Bay Section;

(4) Urelia Bay Section: all waters on the north side of Unimak Island west of the longitude of Otter Point (163°47' W. long.) and east of the northernmost tip of Cape Mordvinof (54°56' N. lat., 164°25'45" W. long.), including Peterson and Christianson Lagoons;

(5) Dublin Bay Section: all waters on the northwest side of Unimak Island west of the northernmost tip of Cape Mordvinof and east of Cape Sarichef Light (54° 35'50" N. lat., 164° 55' 30" W. long.).

(c) The Unimak District includes all waters on the south side of Unimak Island between a line extending from Scotch Cap (54°24' N. lat., 164°47'36" W. long.) through the easternmost tip of Ugamak Island (54°12'42" N. lat., 164°45'48" W. long.), and a line extending 115° from Cape Pankof Light (54°39'36" N. lat., 163°03'36" W. long.), including the Sanak Islands;

(1) Cape Lutke Section: all waters of the Unimak District east of a line extending from Scotch Cap (54°24' N. lat., 164°47'36" W. long.) through the easternmost tip of Ugamak Island (54°12'42" N. lat., 164°45'48" W. long.), and west of the longitude of Rock Island (163°37'18" W. long.);

(2) Otter Cove Section: all waters of the Unimak District east of the longitude of Rock Island (163°37'18" W. long.) and north of 54°30' N. lat.;

(3) Sanak Island Section: all waters of the Unimak District east of the longitude of Rock Island (163°37'18" W. long.) and south of 54°30' N. lat..

(d) Southwestern District: all waters on the south side of the Alaska Peninsula north and east of a line extending 115° from Pankof Light (54°39'36" N. lat., 163°03'36" W. long.) and west of a line extending 106° from Arch Point Light (55°12'20" N. lat., 161°54'15" W. long.) to the western boundary of the Southeastern District (longitude of McGinty Point: 160°59' W. long.), including Inner Iliasik, Outer Iliasik, Goloi, Dolgoi, Poperechoi, and Deer Islands, all waters of Ikatan Bay, and all waters of Isanotski Strait south of a line from the False Pass cannery dock (54°51'30" N. lat., 163°24'30" W. long.) to Nichols Point (54°51'30" N. lat., 163°23'10" W. long.);

(1) Ikatan Bay Section: all waters of the Southwestern District located south and west of a line from Kenmore Head (54°57' N. lat., 163°01'40" W. long.) to Hague Rock (54°33'10" N. lat., 162°24' W. long.), and west of a line extending true south from Hague Rock;

(2) Morzhovoi Bay Section: all waters of Morzhovoi Bay north of a line from Kenmore Head to Cape Tachilni (54°56' N. lat., 162°52'30" W. long.);

(3) Thin Point Section: all waters of the Southwestern District east of Kenmore Head (54°57' N. lat., 163°01'40" W. long.) and west of Thin Point (54°57'30" N. lat., 162°33'30" W. long.), excluding waters of the Ikatan, Morzhovoi, and Cold Bay Sections;

ALASKA PENINSULA AREA

- (4) Cold Bay Section: all waters north of a line from Thin Point to Vodapoini Point;
 - (5) Deer Island Section: all waters within one nautical mile of Deer Island;
 - (6) Belkofski Bay Section: all waters between Vodapoini Point and Moss Cape, including Inner and Outer Iliasik Islands but excluding the waters of the Deer Island section;
 - (7) Volcano Bay Section: all waters between Moss Cape and Arch Point including Goloi, Dolgoi and Poperechnoi Islands;
 - (8) General Section: all other waters of the Southwestern district.
- (e) South Central District: all waters on the south side of the Alaska Peninsula north and east of a line extending 106° from Arch Point Light (55°12'20" N. lat., 161°54'15" W. long.), and west of a line extending south from McGinty Point (55°27'30" N. lat., 160°59' W. long.), including Ukolnoi and Wosnesenski Islands;
- (1) Pavlof Bay Section: all waters of Pavlof Bay, excluding the Canoe Bay section, and all other waters of the district west of the longitude of Cape Tolstoi (161°30' W. long.);
 - (2) Canoe Bay Section: all waters of Canoe Bay enclosed by a line from a point at 55°35'37" N. lat., 161°21'33" W. long. to a point at 55°35'41" N. lat., 161°21'40" W. long.;
 - (3) Mino Creek-Little Coal Bay Section: all waters of the district, excluding those of the Pavlof Bay and Canoe Bay sections, between the longitude of McGinty Point (160°59' W. long.) and the longitude of Cape Tolstoi (161°30' W. long.);
- (f) Southeastern District: all waters on the south side of the Alaska Peninsula east of a line extending south from McGinty Point (55°27'30" N. lat., 160°59' W. long.), and west of a line extending 135° from Kupreanof Point (55°34' N. lat., 159°36' W. long.), including all of the Shumagin Islands;
- (1) Beaver Bay Section: all waters of the Southeastern District east of the longitude of McGinty Point (160°59' W. long.), west of 160°49' W. long., and north of 55°26' N. lat.;
 - (2) Balboa Bay Section: all waters of the Southeastern District east of 160°49' W. long., north of 55°26' N. lat., and west of the longitude of Swedania Point (160°31'30" W. long.);
 - (3) Shumagin Islands Section: all waters of the Southeastern District east of the longitude of McGinty Point (160°59' W. long.), west of a line extending 135° from Kupreanof Point (55°34' N. lat., 159°36' W. long.), south of a line from 55°26' N. lat., 160°31'30" W. long., to 55°32'12" N. lat., 160°02'36" W. long. (approximately 1 nautical mile north of Karpa Island), and east to the Alaska Peninsula Area boundary (a line extending 135° from Kupreanof Point), excluding the Beaver Bay, Balboa Bay, and Southwest Stepovak Sections:
 - (4) Southwest Stepovak Section: all waters of the Southeastern District south of the latitude of 55°37'20" N. lat., west of 159°52' W. long., north of Shumagin Islands Section, and east of the Balboa Bay Section;
 - (5) Northwest Stepovak Section: all waters of the Southeastern District north of 55°37'20" N. lat. and west of the longitude of Dent Point (159°52' W. long.);
 - (6) Stepovak Flats Section: all waters of the Southeastern District north of 55°48'18" N. lat. and east of the longitude of Dent Point (159°52' W. long.);

(7) East Stepovak Section: all waters of the Southeastern District south of 55°48'18" N. lat., east of the longitude of Dent Point (159°52' W. long.), north of 55°32'12" N. lat., and west of a line extending 135° from Kupreanof Point (55°34' N. lat., 159°36' W. long.).

ARTICLE 3. - SALMON FISHERY

5 AAC 09.301. SEAWARD BOUNDARY OF DISTRICTS. For the purpose of managing the historical salmon net fishery in the vicinity of False Pass and Unimak Bight, the outer boundary of the Southwestern and Unimak Districts is a line three miles seaward from a line commencing at 54°26'45" N.lat., 162°53' W.long., near the western end of Sanak Island to Cape Lutke on Unimak Island. The seaward boundary of all other districts is a line three miles seaward of the baseline described in 5 AAC 39.975(13).

5 AAC 09.310. FISHING SEASONS. (a) In the Northern District, salmon may be taken as follows:

(1) Cinder River Section

(A) from May 1 through September 30 within the lagoon into which Cinder River drains (locally known as False Ugashik or Shagong);

(B) from August 1 through September 30 throughout this section;

(2) Port Heiden Sections:

(A) Inner Point Heiden Section: from May 1 through September 30;

(B) Outer Port Heiden Section: no open season;

(3) Ilnik Section

(A) from May 1 through September 30 within Ilnik Lagoon and all waters inside the Seal Islands;

(B) from July 5 through July 15 in all waters west of Unangashak Bluffs at Loran line 9990-Y-33265 and the longitude of Three Hills (159°50' W. long);

(C) from July 15 through September 30 throughout the remainder of the section;

(4) Three Hills Section: from June 25 through September 30;

(5) Bear River Section: from May 1 through September 30;

(6) Herendeen-Moller Bay Section: from May 1 through July 20 with the exception that within the bight enclosed by a line from Entrance Point to Harbor Point salmon may be taken from May 1 through September 30;

(7) Nelson Lagoon Section: from May 1 through September 30;

(8) Caribou Flats Section: no open season;

(9) Black Hills Section: from May 1 through September 30.

(b) In the Northwestern District, salmon may be taken only from June 1 through August 10, except that

ALASKA PENINSULA AREA

- (1) in the Dublin Bay Section, salmon may be taken only from July 10 through August 10;
- (2) in the Bechevin Bay Section, salmon may be taken only from June 1 through September 30;
- (3) after September 1, the salmon fishery season will be opened by emergency order.
- (c) In the Unimak District, salmon may be taken only from June 1 through September 30.
- (d) In the Southwestern District, salmon may be taken only from June 1 through September 30.
- (e) In the South Central District, salmon may be taken only from June 1 through September 30.
- (f) In the Southeastern District, salmon may be taken only from June 1 through September 30.

5 AAC 09.320. FISHING PERIODS. (a) In the Northern District, salmon may be taken from 6:00 a.m. Monday until 6:00 p.m. Thursday, except as follows:

(1) in the Black Hills Section, salmon may be taken from 6:00 a.m. Monday until 6:00 p.m. Friday;

(2) in the Nelson Lagoon Section, salmon may be taken

(A) during the period May 1 through June 15, from 6:00 a.m. Monday until 12:00 midnight Wednesday;

(B) during the period June 16 through August 15, from 6:00 a.m. Monday until 12:00 midnight Thursday;

(C) after August 15, from 6:00 a.m. Monday until 12:00 midnight Wednesday;

(3) in the Cinder River, Inner Port Heiden, and Ilnik Sections salmon may be taken from 6:00 a.m. Monday until 6:00 p.m. Wednesday.

(4) before July 1, in the Three Hills and Bear Rivers sections, salmon may be taken from 6:00 a.m. Monday until 6:00 p.m. Wednesday.

(b) Salmon may be taken only during the open season in the Northwestern District in the

(1) Izembek-Moffet Bay Section: from 6:00 a.m. Monday until 6:00 p.m. Thursday;

(2) Bechevin Bay Section: only during fishing periods established by emergency order;

(3) Urilia Bay Section: from 6:00 a.m. Monday until 6:00 p.m. Thursday;

(4) Dublin Bay Section, from 6:00 a.m. Monday until 6:00 p.m. Thursday;

(5) Swanson Lagoon Section, from 6:00 a.m. Monday until 6:00 p.m. Thursday.

(c) Salmon may be taken during the open season in the Unimak District during fishing periods established by emergency order.

(d) Salmon may be taken only during the open season in the Southwestern District only during fishing periods established by emergency order.

ALASKA PENINSULA AREA

(e) Salmon may be taken only during the open season in the South Central District only during fishing periods established by emergency order.

(f) Salmon may be taken only during the open season in the Southeastern District only during fishing periods established by emergency order.

5 AAC 09.330. GEAR. (a) In the Northern District salmon may be taken:

(1) in the Cinder River Section: with drift gill nets or set gill nets only;

(2) in the Inner Port Heiden Section: with drift gill nets or set gill nets only;

(3) in the Ilnik Section: with drift gill nets or set gill nets only;

(4) in the Three Hills Section: with drift gill nets only;

(5) in the Bear River Section: with drift gill nets, purse seines and hand purse seines;

(6) in the Herendeen-Moller Bay Section: with drift gill nets, set gill nets, purse seines and hand purse seines;

(7) in the Nelson Lagoon Section: with drift gill nets or set gill nets;

(9) in the Black Hills Section; with drift gill nets or set gill nets only;

(b) in the Northwestern District, salmon may be taken with drift gill nets, set gill nets, purse seines and hand purse seines.

(c) In the Unimak District, salmon may be taken with drift gill nets, set gill nets, purse seines and hand purse seines. Salmon may be taken by gillnet gear during periods when the seine fishery is closed by emergency order due to the presence of immature salmon.

(d) In the Southwestern District, salmon may be taken with purse seines, hand purse seines and set gill nets except that

(1) salmon may also be taken with drift gill nets west of a line from Kenmore Head to Hague Rocks to the easternmost tip of the Sanak Islands;

(3) salmon may be taken by gillnet gear during periods when the seine fishery is closed by emergency order due to the presence of immature salmon.

(e) In the South Central District, salmon may be taken with set gill nets, purse seines and hand purse seines, except that

(2) within Canoe Bay, salmon may be taken only with purse seines and hand purse seines;

(4) salmon may be taken by gillnet gear during periods when the seine fishery is closed by emergency order due to the presence of immature salmon.

(f) In the Southeastern District, salmon may be taken only with set gill nets, purse seines and hand purse seines except that

(1) salmon may be taken only with purse seines and hand purse seines in the area between Popof Head and Dark Cliffs (Popof Island) from June 1 through August 31; however, salmon may be taken by gillnet gear during periods when the seine fishery is closed by emergency order due to the presence of immature salmon.

ALASKA PENINSULA AREA

(3) salmon may be taken only with set gill nets from June 1 through July 10 in the Beaver Bay, Balboa Bay, Southwest Stepovak, Northwest Stepovak, Stepovak Flats, and East Stepovak Sections;

(4) salmon may be taken by set gill net during periods when the seine fishery is closed by emergency order due to presence of immature salmon.

5 AAC 09.331. GILL NET SPECIFICATIONS AND OPERATION. (a) The size and operation of drift gill nets is as follows:

(1) the aggregate length of drift gill nets on a salmon fishing boat or in use by such boat shall be no more than 200 fathoms in length;

(2) the mesh size of drift gill nets may not be less than five and one-quarter inches except that in the Bear River Section of the Northern District there is no minimum mesh size after July 20;

(3) in the Northwestern, Unimak, and Southwestern Districts, no drift gill net may exceed 90 meshes in depth;

(4) in the Northern District a drift gill net may not exceed 70 meshes in depth, except that in the Nelson Lagoon Section a drift gill net may not exceed 29 meshes in depth before August 16 and 38 meshes in depth from August 16 through September 30; a drift gill net may have only one leadline, which may not exceed 60 fathoms per 50 fathoms of corkline, and no portion of the leadline may exceed 1.5 pounds per fathom.

(b) The size and operation of set gill nets is as follows:

(1) a set gill net may be no more than 100 fathoms in length; the aggregate length of set gill nets operated by a CFEC permit holder may be no more than 200 fathoms; no more than two gill net sites may be operated by a CFEC permit holder except that in the

(A) Inner Port Heiden Section a set gill net may be no more than 50 fathoms in length; the aggregate length of set gill nets operated by a CFEC permit holder may be no more than 100 fathoms; and no more than two gill net sites may be operated by a CFEC permit holder;

(B) Ilnik Lagoon (portion of the Ilnik Section) a set gill net may be no more than 50 fathoms in length; the aggregate length of set gill nets operated by a CFEC permit holder may be no more than 150 fathoms; and no more than three gill net sites may be operated by a CFEC permit holder;

(C) in the Northwestern, Unimak, Southwestern, Southcentral, and Southeastern Districts a set gill net may not exceed 90 meshes in depth;

(2) set gill nets shall be operated in substantially a straight line; no more than 30 fathoms of each set gill net may be used as a single hook;

(3) the mesh size of a set gill net may not be less than five and one-quarter inches;

(4) in the Northern District the maximum depth of a set gill net may not exceed 70 meshes in depth, except in the Nelson Lagoon Section a set gill net may not exceed 29 meshes in depth;

(5) in the Unimak, Southwestern, South Central, and Southeastern Districts, 10 fathoms of seine webbing may be used on the shoreward end of a set gill net; the shoreward end of the seine webbing must be attached to the beach above low tide;

(6) during hours of darkness, each set gill net must be marked with at least one red light on

the seaward end of the net, and at least one red light on both ends of the net if that net is more than 300 feet from shore;

(7) in Swanson Lagoon within the Swanson Lagoon Section of the Northwestern District, a person may not place a set gill net in the water if that placement would result in more than 50 percent of the channel east of 163°38'42" W. long. being blocked to the movement of boat traffic at any stage of the tide;

(8) in the Cinder River and Ilnik Sections of the Northern District a person may not place the seaward end of a set gill net further than one-half mile from the terrestrial vegetation line of the beach, except that in the Seal Islands a person may not place the seaward end of a set gill net within one-half mile of the mean high water mark.

5 AAC 09.332. SEINE SPECIFICATIONS AND OPERATION. (a) Purse seines or hand purse seines may not be less than 100 fathoms nor more than 250 fathoms in length. A purse seine or hand purse seine may not exceed 375 meshes in depth. Seine mesh may not be more than 3 1/2 inches, except that the first 25 meshes above the lead line may not be more than 7 inches.

(b) Leads may not be less than 50 fathoms nor more than 150 fathoms in length. Only one lead may be used with a seine. A lead may be attached to only one end of a seine, and the lead may not be attached to the boat end of the seine.

5 AAC 09.334. IDENTIFICATION OF GEAR. (a) Each drift gill net in operation must have at each end a bright red keg, buoy or cluster of floats plainly and legibly marked with the permanent vessel license plate (ADF&G) number of the vessel operating the gear as well as the initials of the operator.

(b) Each set gill net in operation must be identified as required by 5 AAC 39.280.

5 AAC 09.335. MINIMUM DISTANCE BETWEEN UNITS OF GEAR. No part of a set gill net may be set or operated within 900 feet of any part of another set gill net, except that in the

(1) Inner Port Heiden Section no part of a set gill net may be set or operated within 600 feet of any part of another set gill net;

(2) Nelson Lagoon Section no part of a set gill net may be set or operated within 1,800 feet of any part of another operating set gill net.

5 AAC 09.350. CLOSED WATERS. Salmon may not be taken in the following locations:

(1) Meshik River: all waters upstream of a line crossing the river from a point at 56°47'04" N.lat., 158°41'06" W.long., to 56°47'58" N.lat., 158°38'45" W.long.; this is approximately one-half nautical mile upstream from the mean high tide mouth and approximately at the lower line of permanent grass growth;

(2) Sandy River

(A) May 1 through July 26; within 2,000 yards of the terminus of the river;

(B) July 27 through September 30: within 500 yards of the terminus of the river;

(3) Bear River

(A) May 1 through August 8: within 1,000 yards of the terminus of the river;

ALASKA PENINSULA AREA

(B) August 9 through September 30: within 500 yards of the terminus of the river;

(4) Frank's Lagoon: all waters of the lagoon and within 500 yards outside the entrance;

(5) Bechevin Bay

(A) Saint Catherine Cove (Mike's Creek): all waters within 1,000 yards of the stream located at 55°00'48" N.lat., 163°31'33" W.long.;

(B) Trader's Cove: all waters north and east of a line from Morzhovoi Village (54°54'45" N.lat., 163°18'15" W.long.) to the base of Trader Mountain (55°00'05" N.lat., 163°18'22" W.long.);

(C) Warmsprings Bay: all waters southeast of a line from a point on the south shore of the bay at 54°56'28" N.lat., 163°15'45" W.long., to a point on the north shore of the bay at 54°57'16" N.lat., 163°15'33" W.long.;

(6) Christianson's Lagoon: all waters of the lagoon and its exit channel upstream from a point located 500 yards above the exit channel terminus at the ocean shoreline;

(7) Ikatan Bay: all waters within 1,000 yards of the stream at 54°45'15" N.lat., 163°15'15" W.long. on the north shore of the Ikatan Peninsula which exits from Swede's Lake;

(8) Morzhovoi Bay

(A) Middle Lagoon: all waters of the lagoon and within 1,000 yards of its entrance;

(B) Littlejohn Lagoon: all waters of the lagoon and within 500 yards of its entrance at the narrows;

(9) Thin Point Cove and Lagoon: all waters north and west of a line from the tip of Thin Point westward to a point on the shore at 54°57'30" N.lat., 162°43'15" W.long.;

(10) Cold Bay

(A) Old Man Lagoon, Mortensen Lagoon and Nurse Lagoon: all waters of the lagoons and within 500 yards outside their entrances;

(B) Lenard Harbor: all waters east of a line from a point on the south shore at 55°06' N.lat., 162°23' W.long., to a point on the north shore at 55°07' N.lat., 162°23' W.long., and within 1,000 yards of any salmon stream;

(C) Kinzarof Lagoon area: all waters north of a line from 55°13'25" N.lat., 162°43'25" W.long., to 55°16'10" N.lat., 162°34'25" W.long.;

(11) Deer Island

(A) all waters within 200 yards of the stream located at 54°55'41" N.lat., 162°14'12" W.long. and locally known as Eastern Creek.

(B) all waters within 200 yards of the stream located at 54°51'44" N.lat., 162°22'07" W.long. and locally known as Southern Creek;

(12) Belkofski Bay: all waters north and east of a line from 55°09'22" N.lat., 162°08'12" W.long., to 55°08'08" N.lat., 162°07'03" W.long., then to 55°07'20" N.lat., 162°07'39" W.long.;

(13) Volcano and Bear Bay

(A) all waters north of a line from 55°13'24" N.lat., 162°01'24" W.long., to 55°13'51" N.lat., 161°58' W.long.;

(B) all waters of Bear Bay west of 162° W.long. and locally known as Little Bear Bay;

(14) Longjohn Lagoon: all waters of the lagoon and within 500 yards outside its entrance;

(15) Pavlof Bay

(A) Chinaman Lagoon and Jackson Lagoon: all waters of the lagoons and within 1,000 yards outside their entrances;

(B) Dry Lagoon: all waters of the lagoon and within 500 yards of its entrance;

(C) Canoe Bay: all waters east of 161°14'12" W. long.;

(16) Balboa Bay

(A) all waters north of a line extending west from Reef Point;

(B) all waters of Lefthand Bay west of a line from 55°31'36" N.lat., 160°42'54" W.long., to 55°33'12" N.lat., 160°42'06" W.long.;

(17) Zachary Bay: all waters of the inner bay south and west of a line extending from the inner edge of the grass line of the sand spit to the west of the tip of the prominent point of land approximately one and one-third nautical miles inside Quartz Point;

(18) San Diego Bay: all waters of a lagoon at the head of the bay and within 500 yards outside the lagoon's entrance except that from July 19 through August 31 the closure includes all waters west of a line from the reef at 55°33'08" N.lat., 160°26'30" W.long., to the headland at 55°34'02" N.lat., 160°25'48" W.long.;

(19) Dorenoi Bay

(A) through July 25, all waters north and west of a line from the tip of Renshaw Point to the opposite shore at 55°38'30" N. lat., 160°19' W. long.;

(B) after July 25, all waters within 500 yards of the terminus of any salmon stream;

(20) Chichagof Bay: all waters of the lagoon and within 500 yards of the lagoon entrance;

(21) Orzinski Bay (Orzenoi): within 1,000 yards of any salmon stream;

(22) Grub Gulch: all waters north and east of a line from 55°48'18" N.lat., 159°56'06" W.long. to 55°49'00" N.lat., 159°58'12" W.long.;

(23) Stepovak Bay: from June 1 through July 28, all waters within 500 yards of any salmon stream or lagoon unless otherwise specified; from July 29 through September 30, all waters north of a line extending east from Dent Point at 55° 47'15" N. lat., 159°52' W. long., to a point on the Kupreanof Peninsula at 55°47' N.lat., 159°38'30" W.long.;

(24) Bay Point: all waters of the lagoon and within 500 yards of the lagoon entrance;

ALASKA PENINSULA AREA

(25) Amak Island and adjacent Sea Lion Rocks: all waters within three nautical miles of these islands and elevations;

(27) Applegate Cove-Norma Bay: all waters south of a line from 55°14'08" N.lat., 162°53' W.long., to the southwest extremity of Norma Bay at 55°10'50" N.lat., 163°05'07" W.long.; this boundary aligns with the Cold Bay VORTAL cone and the headland located approximately two nautical miles south of the radar domes near Grant Point.

(28) Ilnik Lagoon: all waters of Ilnik Lagoon and Lake west of 159°30'12" W.long.;

(29) Herendeen Bay

(A) from May 1 through July 20, all waters within 500 yards of any salmon stream unless otherwise specified;

(B) after July 20, all waters south of the latitude of Bold Bluff Point (55°45'15" N.lat.) and within 500 yards of all salmon streams north of 55°45'15" N.lat.

(30) Nelson Lagoon: all waters of the lagoon and river (called Caribou, Nelson, and Lagoon River) flowing into the upper (west) end of Nelson Lagoon, upstream of a line from 55°57'20" N.lat., 161°22'15" W.long. to 55°57'45" N.lat., 161°22'40" W.long.

(31) Caribou Flats: all waters of the Caribou Flats Section;

(32) Cape Menshikof: all waters of the Cinder River Section located north of Loran C line 9990-Y-32920;

(33) King Salmon River:

(A) from May 1 through July 15, all waters within 1000 yards of the stream terminus;

(B) after July 15, all waters within 500 yards of the stream terminus.

(34) Cinder River Lagoon: all waters enclosed by a line from 57° 19' 48" N. lat., 158° 08' 24" W. long., to 57° 21' 18" N. lat., 158° 02' 38" W. long.;

(35) Unangashik River: all waters east of 159° 15' 04" W. long.;

(36) Swanson Lagoon

(A) June 1 through August 31: all waters enclosed by a line from 55° 02' 12" N. lat., 163° 38' 42" W. long., to 55° 01' 58" N. lat., 163° 38' 28" W. long.;

(B) September 1 through October 31: all waters enclosed by a line from 55° 02' 12" N. lat., 163° 38' 42" W. long., to 55° 02' 07" N. lat., 163° 39' 44" W. long.

(37) Outer Port Heiden: all water of the Outer Port Heiden Section.

5 AAC 09.355. SALMON PROCESSOR AND BUYER REPORTING REQUIREMENTS. The operator of a floating salmon processing vessel or tender, or of a shorebased processing operation, and a company employing aircraft used for transporting salmon, shall report in person, or by radio or telephone, to a local representative of the department located in the management area of intended operation before the start of processing or buying operations. The report must include the location and the date of intended operation, and identify and describe each vessel or other method of transport employed in hauling or processing salmon.

ALASKA PENINSULA AREA

5 AAC 09.360. SOUTHEASTERN DISTRICT SALMON MANAGEMENT PLAN. (a) This plan pertains to the management of the interception of Chignik River sockeye salmon caught in the Southeastern District Mainland fishery: East Stepovak, Stepovak Flats, Northwest Stepovak, Southwest Stepovak, Balboa Bay, and Beaver Bay Sections. Before July 11, only set gillnet gear may be used in these sections. For the purpose of this plan, local runs include only those salmon in the waters

1) of Orzinski Bay north of a line from Elephant Point (55° 41' 55" N.lat., 160° 03' 12" W.long.) to Waterfall Point (55° 43' 13" N.lat., 160° 01' 05" W.long.) and;

2) in the Stepovak Flats Section as described in 5 AAC 09.200(f).

(b) In years when a harvestable surplus for the first (Black Lake) and second (Chignik Lake) runs of Chignik River system sockeye salmon is expected to be less than 600,000, no commercial salmon fishery is allowed in the East Stepovak, Northwest Stepovak (except Orzinski Bay), Southwest Stepovak, Balboa Bay, and Beaver Bay Sections, as described in 5 AAC 09.200(f), until a harvest of 300,000 sockeye salmon is achieved in the Chignik Area, as described in 5 AAC 15.100. After July 8, if at least 300,000 sockeye salmon have been harvested in the Chignik Area, and if escapement goals are being met, the department shall manage the fishery so that the number of sockeye salmon harvested in the Chignik Area will be at least 600,000 and the number of sockeye salmon harvested in the East Stepovak, Stepovak Flats, Northwest Stepovak (except Orzinski Bay), Southwest Stepovak, Balboa Bay, and Beaver Bay Sections approaches as near as possible seven percent of the total Chignik sockeye salmon catch.

(c) In years when a harvestable surplus beyond escapement goals for the first and second runs of Chignik River system sockeye salmon is expected to be more than 600,000, but the first run fails to develop as predicted and it is determined that a total sockeye salmon harvest in the Chignik Area of 600,000 or more might not be achieved, the commercial salmon fishery in the East Stepovak, Stepovak Flats, Northwest Stepovak (except Orzinski Bay), Southwest Stepovak, Balboa Bay, and Beaver Bay Sections shall be curtailed in order to allow a harvest in the Chignik Area of at least 300,000 sockeye salmon by July 9 if that number of fish are determined to be surplus to the escapement goals of the Chignik River system. After July 8, if at least 300,000 sockeye salmon have been harvested in the Chignik Area, and if escapement goals are being met, the department shall manage the fishery so that the number of sockeye salmon harvested in the Chignik Area is at least 600,000 and the number of sockeye salmon harvested in the East Stepovak, Stepovak Flats, Northwest Stepovak (except Orzinski Bay), Southwest Stepovak, Balboa Bay, and Beaver Bay Sections approaches as near as possible seven percent of the total Chignik sockeye salmon catch.

(d) In years when a harvestable surplus beyond the escapement goals for the first and second runs of Chignik River system sockeye salmon is expected to be more than 600,000 and the department determines that the runs are as strong as expected, the department shall manage the fishery so that the number of sockeye salmon taken in the East Stepovak, Stepovak Flats, Northwest Stepovak (except Orzinski Bay), Southwest Stepovak, Balboa Bay, and Beaver Bay Sections approaches as near as possible seven percent of the total Chignik sockeye salmon catch.

(e) The estimate of sockeye salmon destined for the Chignik River has been determined to be 80 percent of the sockeye salmon harvested in the East Stepovak, Stepovak Flats, Northwest Stepovak (except Orzinski Bay), Southwest Stepovak, Balboa Bay, and Beaver Bay Sections. The remaining sockeye salmon taken in the Southeastern District Mainland fishery (Orzinski Bay) have been determined to be destined for Orzinski Bay.

(f) The total Chignik sockeye salmon catch constitutes those sockeye salmon caught within the Chignik Area, plus 80 percent of the sockeye salmon caught in the East Stepovak, Stepovak Flats, Northwest Stepovak (except Orzinski Bay), Southwest Stepovak, Balboa Bay, and Beaver Bay

ALASKA PENINSULA AREA

Sections, as described in 5 AAC 09.200(f), plus 80 percent of the sockeye salmon caught in the Cape Igvak Section of the Kodiak Area. The percentage of Chignik sockeye salmon may be permitted to fluctuate above or below seven percent at any time before July 25.

(g) The allocation method described in (a)-(f) of this section is in effect through July 25. The department may not open the first fishing period of the commercial salmon fishing season in the East Stepovak, Northwest Stepovak (except Orzinski Bay), Southwest Stepovak, Balboa Bay, and Beaver Bay Sections before the first fishing period of the commercial salmon fishing season in the Chignik Area. After July 25 the department may open, for local stocks, commercial salmon fishing in the entire Southeastern District Mainland area.

(h) During the period from approximately June 26 to July 9, the strength of the second run of the Chignik River system sockeye salmon cannot be evaluated. In order to prevent overharvest of the second run, the department may disallow or severely restrict commercial salmon fishing in the East Stepovak, Stepovak Flats, Northwest Stepovak (except Orzinski Bay), Southeastern District Mainland fishery (Orzinski Bay), Southwest Stepovak, Balboa Bay, and Beaver Bay Sections during this period.

(i) The department shall announce all commercial salmon fishing periods by emergency order. The department shall give at least 24 hours notice before the opening of a commercial salmon fishing period, unless it is an extension of a fishing period in progress.

5 AAC 09.365. SOUTH UNIMAK AND SHUMAGIN ISLANDS JUNE SALMON MANAGEMENT PLAN. (a) Mixed stocks of salmon bound for distant systems have historically been intercepted in significant numbers along the Alaska Peninsula. To ensure that none of these runs are overharvested, it is necessary to restrain their interception.

(b) The Alaska Board of Fisheries has established sockeye guideline harvest levels on the South Unimak and Shumagin Islands interception fisheries during June, which are based on percentages of the latest projected Bristol Bay inshore sockeye harvest as published by the Department of Fish and Game. The South Unimak fishery takes place in the Unimak District and the Ikatan Bay and Bechevin Bay Sections, as described in 5 AAC 09.200(b)(2), (c), (d)(1), plus the following waters of the Southwestern district outside of the Ikatan Bay Section and not included under 5 AAC 09.350: (1) all waters north and west of a line from Cape Pankof light to Thin point (54°57'26" N. lat., 162°33'12" W. long.); and (2) all waters enclosed by a line from Thin point (54°57'26" N. lat., 162°33'12" W. long.) to the northernmost tip of Stag Point (54°10' N. lat., 161°53'45" W. long.) on Deer island to the southernmost tip of Dolgoi Cape (55°03'45" N. lat., 161°44' W. long.) on Dolgoi Island and from the northernmost tip of Bluff Point (55°10' N. lat., 161°53'45" W. long.) on Dolgoi Island to Arch Point Light (55°12'20" N. lat., 161°54'15" W. long.). The Shumagin Islands fishery takes place in the Shumagin Islands Section, as described in 5 AAC 09.200(f)(3). Consistent with the board's Policy Statement on Management of Mixed Stock Salmon Fisheries and traditional harvest patterns, the maximum percentage allowed for the South Unimak fishery is 6.8 percent and for the Shumagin Islands fishery, 1.5 percent. The forecasts for Bristol Bay are sometimes updated as more information becomes available, just before the South Unimak and Shumagin Islands season, and exact numbers of fish cannot be given before the opening of each fishery.

(c) The sockeye guideline harvest levels are distributed proportionally over the June runs to avoid excessive impacts on any segment of the runs. The total allowable harvest in each area shall be harvested according to the following guideline ranges established for the following time periods:

Time Period.....	Guideline Harvest
June 13-18	35%
June 19-25	45%
June 26-30	<u>20%</u>
	100%

ALASKA PENINSULA AREA

(d) Fishing periods will be announced by field emergency order, and will be adjusted to keep the harvest within the guidelines for each time period. If catches in either fishery fall below the guidelines in the first time period, those unharvested sockeye, up to a maximum of five percent of the total guideline harvest level for that fishery will be added to the guideline harvest level for the second time period. If guideline harvest levels are inadvertently exceeded during any given fishing period, the excess will be a portion of the total guideline harvest level. If, during the last fishing period, the staff determines that no significant fishing occurred due to weather conditions, the staff may permit fishing to continue after June 30.

(e) The South Unimak and Shumagin Island June salmon fisheries target on the more abundant and valuable sockeye salmon. The board recognizes that the harvest of other salmon species is incidental to the sockeye harvest. The board has determined that this incidental harvest is unavoidable and cannot be regulated with the present level of knowledge regarding these fisheries. The board will not support any significant increase in the interception rate of chum salmon taken in the South Unimak and Shumagin Islands June salmon fisheries. These stocks are probably fully utilized in existing terminal fisheries of long standing. This determination is consistent with the philosophy contained in the board's Policy Statement on Management of Mixed Stock Salmon Fisheries. The board recognizes that the conservation and allocation of non-targeted salmon stocks may be a concern during some years, but does not have the data to ensure specific corrective action at this time (January 1990).

(f) The department shall close the June fishery before the sockeye guideline harvest levels are taken if incidental harvest of chum salmon reaches 700,000 fish. When the harvest reaches 400,000 chum salmon, the department shall take appropriate in season management action to reduce the chum salmon harvest while attempting to allow full harvest of the sockeye salmon guideline harvest level. The documented contribution of Russell Creek Hatchery chum salmon to the June fishery shall be added to the chum salmon quota beginning in 1993.

(g) If it becomes necessary for the department to reduce chum salmon harvest, as specified in subsection (f) of this section, fishing periods for set gill net gear shall not be less than 16 hours, unless a fishing period over 16 hours will result in a harvest that exceeds the 700,000 chum salmon maximum incidental annual harvest.

5 AAC 09.366. POST JUNE SALMON MANAGEMENT PLAN FOR THE SOUTHERN ALASKA PENINSULA. (a) The department may open the following areas to salmon fishing from July 20 through September 30:

(1) the Shumagin Islands Section of the Southeastern District, excluding all waters south of a line extending from the eastern shore of Zachary Bay at 55° 22' 39" N. lat., 160° 35' 03" W. long., to a point on the western shore of Zachary Bay at 55° 22' 39" N. lat., 160° 38' 17" W. long.;

(2) the Southcentral District, excluding the Canoe Bay Section and all waters north of the Pavlof Bay Section north of the latitude of Black Point (55° 24' 34" N. lat.);

(3) the Southwestern District, excluding the Cold Bay, Thin Point, and Morzhovoi Bay Sections, and the Unimak District.

(b) The department may open the following areas to salmon fishing from July 6 through September 30:

(1) in the Shumagin Islands Section of the Southeastern District, all waters south of a line extending from the eastern shore of Zachary Bay at 55° 22' 39" N. lat., 160° 35' 03" W. long., to a point on the western shore of Zachary Bay at 55° 22' 39" N. lat., 160° 38' 47" W. long.;

ALASKA PENINSULA AREA

(2) in the Pavlof Bay Section of the Southcentral District, all waters north of the latitude of Black Point (55° 24' 34" N. lat.);

(3) the Canoe Bay Section of the Southcentral District;

(4) in the Southwestern District, the Cold Bay, Thin Point and Morzhovoi Bay Sections.

ARTICLE 5. - SMELT FISHERY

5 AAC 09.510. FISHING SEASON. There is no closed season on smelt.

CHAPTER 12. - ALEUTIAN ISLANDS AREA

ARTICLE 1. - DESCRIPTION OF AREA

5 AAC 12.001. APPLICATION OF THIS CHAPTER Requirements set forth in this chapter apply to commercial fishing only, unless otherwise specified. Subsistence fishing regulations affecting commercial fishing vessels or affecting any other commercial fishing activity are set forth in the subsistence fishing regulations in 5 AAC 01 and 5 AAC 02.

5 AAC 12.100. DESCRIPTION OF AREA (a) Except as provided in (b) of this section the Aleutian Islands Area includes all waters of Alaska in the Aleutian Islands west of Cape Sarichef Light and west of a line extending from Scotch Cap through the easternmost tip of Ugamak Island.

(b) The Aleutian Islands Area does not include the Atka-Amlia Islands Area described in 5 AAC 11.100.

(c) Subsection (b) of this section is repealed December 31, 1994.

ARTICLE 2. - FISHING DISTRICTS AND SECTIONS

5 AAC 12.200. DESCRIPTION OF DISTRICTS AND SECTIONS. (a) Akutan District: all waters between Scotch Cap and Cape Sarichef Light and extending west to and including Akutan Pass. South of Scotch Cap Light, the eastern boundary of the district is a line extending from Scotch Cap through the easternmost tip of Ugamak Island.

(b) Unalaska District: all waters west of Akutan Pass to and including Umnak Pass;

(1) Beaver Inlet Section: all waters between Cape Sedanka and Cape Kalekta and including Unalga Island;

(2) Unalaska Bay Section: all waters between Cape Kalekta and Cape Kovrizhka;

(3) Makushin Bay Section: all waters between Cape Kovrizhka and Spray Cape;

(4) Kashega Bay Section: all waters between Spray Cape and Konets Head;

(5) Southern Section: all waters between Konets Head and Cape Sedanka.

(c) Umnak District: all waters west of Umnak Pass to Seguam Pass at 172° 50' W. long.

(d) Adak District: all waters west of Atka Pass at 175° 23' W. long., to the terminus of the Aleutian Islands.

ARTICLE 3. - SALMON FISHERY

5 AAC 12.310. FISHING SEASONS Salmon may be taken only from July 10 through September 30, except that in the Kashega Bay Section, salmon may be taken only from June 1 through September 30.

5 AAC 12.320. WEEKLY FISHING PERIODS. Salmon may be taken only as follows:

Appendix A.2. (page 2 of 2)

(1) June 1 through July 18, from 6:00 a.m. Monday until 6:00 p.m. Friday;

(2) from July 19 through September 30, salmon may be taken during open season only during fishing periods established by emergency order;

5 AAC 12.330. GEAR. Salmon may be taken by purse seines, hand purse seines and beach seines.

5 AAC 12.332. SEINE SPECIFICATIONS AND OPERATION. (a) Purse seines and hand purse seines may not be less than 100 fathoms nor more than 250 fathoms in length.

(b) Beach seines may not be less than 100 fathoms in length and 3 fathoms in depth, nor more than 250 fathoms in length and 12 fathoms in depth.

(c) No lead may be less than 25 fathoms nor more than 150 fathoms in length.

5 AAC 12.350. CLOSED WATERS. The waters of Inner Iliulik Harbor and Margrets Bay between the Unalaska-Dutch Harbor bridge and 166°32' W. long. are closed to the taking of salmon.

5 AAC 12.355. SALMON PROCESSOR AND BUYER REPORTING REQUIREMENTS. The operator of a floating salmon processing vessel or tender, or a shorebased processing operation, and a company employing aircraft used for transporting salmon, shall report in person, or by radio or telephone, to a local representative of the department located in the management area of intended operation before the start of processing or buying operations. The report must include the location and the date of intended operation, and identify and describe each vessel or other method of transport employed in hauling or processing salmon.

CHAPTER 11. - ATKA-AMLIA ISLANDS AREA

ARTICLE 1. - DESCRIPTION OF AREA

5 AAC 11.001. APPLICATION AND INTENT OF THIS CHAPTER (a) This chapter applies to commercial fishing only, unless otherwise specified. Subsistence fishing regulations that affect commercial fishing vessels or other commercial fishing activity are set out in the subsistence fishing regulations in 5 AAC 01 and 5 AAC 02.

(b) The Atka-Amlia Island salmon fishery is established as an experimental fishery created to harvest underutilized pink salmon stocks in the terminal bays of Atka and Amlia Islands.

(c) This section is repealed December 31, 1994.

5 AAC 11.100. DESCRIPTION OF AREA (a) The Atka-Amlia Islands Area includes all waters of Alaska between Seguam Pass (172° 50' W. long.) and Atka Pass (175° 23' W. long.)

(b) This section is repealed December 31, 1994.

ARTICLE 3. SALMON FISHERY

5 AAC 11.310. FISHING SEASONS (a) Salmon may be taken only from August 1 through August 31.

(b) This section is repealed December 31, 1994.

5 AAC 11.320. WEEKLY FISHING PERIODS (a) Salmon may be taken only from 6:00 a.m. to 6:00 p.m. Mondays, Wednesdays and Fridays.

(b) This section is repealed December 31, 1994.

5 AAC 11.330. GEAR (a) Salmon may be taken by purse seines, and set gillnets. A purse seine may be operated only by the holder of an Area M CFEC purse seine limited entry permit.

(b) This section is repealed December 31, 1994.

5 AAC 11.331. GILL NET SPECIFICATIONS AND OPERATION (a) The size and operation of a set gillnet is as follows:

(1) a set gillnet may not exceed 100 fathoms in length; each CFEC permit holder may operate no more than one set gill net;

(2) a set gillnets must be operated in a substantially straight line, with no more than 25 fathoms of the offshore end may be set in any configuration;

(3) the mesh size of a set gillnet may not exceed five inches;

(4) the maximum depth of a set gillnet may not exceed 90 meshes;

(5) 25 fathoms of seine webbing may be used as a lead, and may be attached only to the shoreward end of a set gill net; the shoreward end of the lead or gill net must be attached to the beach above high tide and remain dry at all times;

Appendix A.3. (page 2 of 2)

(6) during hours of darkness, each set gillnet must be marked with at least one red light on the seaward end of the net.

(b) This section is repealed December 31, 1994.

5 AAC 11.332. SEINE SPECIFICATIONS AND OPERATION (a) A purse seine must be at least 100 fathoms long, but may not exceed 250 fathoms in length.

(b) A seine lead must be at least 25 fathoms long, but may not exceed 150 fathoms in length.

(c) This section is repealed December 31, 1994.

5 AAC 11.341. VESSEL LENGTH (a) A vessel used for set net fishing may not exceed 29 feet in overall length.

(b) This section is repealed December 31, 1994.

5 AAC 11.350. CLOSED WATERS (a) The waters specified in 5 AAC 39.290 are closed to salmon fishing.

(b) This section is repealed December 31, 1994.

5 AAC 11.370. REGISTRATION (a) Each Atka-Amlia Islands Area seine and set net permit holder shall register himself or herself, and each vessel that permit holder will use, by contacting a department area management biologist in Dutch Harbor, Cold Bay, Sand Point, or other place specified by the department, at least 48 hours before the season opens or before beginning commercial fishing.

(b) This section is repealed December 31, 1994.

APPENDIX B: EMERGENCY ORDER SUMMARY

Appendix B.1. Alaska Peninsula Management Area emergency order summary, 1992.

EMERGENCY ORDER NO. 4-F-M-PM-01-92

EFFECTIVE DATE: 6:00 P.M. June 10, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Bear River Section of the Northern District 24 hours from 6:00 p.m. Wednesday June 10 until 6:00 p.m. Thursday June 11.

JUSTIFICATION: The Bear River escapement as of 8:45 a.m. June 10 was 1,900 sockeye. The June 15 minimum escapement goal is 2,000 sockeye. With the current escapement rate, the minimum escapement goal for June 15 should be exceeded. The Bear River escapement went from 561 fish on June 8 to 1,499 on June 9. As of June 10 at 8:45 a.m., 400 sockeye were passed through the weir with a good showing still behind the weir.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-01-92

EFFECTIVE DATE: 12:01 A.M. June 13, 1992

EXPLANATION: This emergency order closes the waters near Sanak Island (bounded by the latitude of Hague Rock and the longitude of Cape Pankof Light south of the latitude of Hague Rock) during June 13 through July 5, 1992.

JUSTIFICATION: There is a limit to the number of chum salmon that can be taken in the South Unimak and Shumagin Islands June fisheries (these fisheries will begin no earlier than June 13 and could potentially extend until July 5), although sockeye are the targeted species. If the chum cap is reached, the fishery will close regardless of the unharvested sockeye allocation.

In the past, the area around Sanak Island has produced high chum to sockeye ratios. Historically, commercial salmon fishing records indicate a very limited to non-existent fishing effort near Sanak Island, although during the past two years, fishing interest has increased. Even though the fishing effort was light (i.e. less than 4 boats), the corresponding catch per unit of effort combined with the high chum per sockeye ratio could result in substantial numbers of chum salmon being harvested, if effort were to increase. A substantial amount of effort around Sanak Island could result in a loss of sockeye salmon to the South Unimak - Shumagin Islands June fishery.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-02-92

EFFECTIVE DATE: 6:00 A.M. June 15, 1992

EXPLANATION: This emergency order allows a 6:00 A.M. until 10:00 P.M. commercial salmon fishing period during June 15 in the South Unimak - Shumagin Islands fisheries.

-Continued-

JUSTIFICATION: The June 12 - 18 sockeye allocations for the Shumagin Islands and South Unimak fisheries are 151,000 and 686,000 fish respectively. A 700,000 chum salmon catch ceiling is placed over both fisheries combined. Test fishing indicated that the chum to sockeye ratio was too high to allow a fishery on the earliest possible dates of June 13 and 14. The ratio is improving and fishing time is needed to harvest the sockeye allocations.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-03-92

EFFECTIVE DATE: 10:00 P.M. June 15, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 16 hours until 2:00 P.M. June 16 in the South Unimak fishery.

JUSTIFICATION: The June 12 - 18 sockeye allocations for the Shumagin Islands and South Unimak fisheries are 151,000 and 686,000 fish respectively. A 700,000 chum salmon catch ceiling is placed over both fisheries combined. Reports from fishermen in the Shumagin Islands indicate large numbers of salmon are being harvested and no more fishing time should be allowed until the catches are totaled after the present fishing period. However, at south Unimak there are reports extending over the entire fishery of unusually sockeye to chum ratios. The volume at South Unimak is reported to be moderate. A 16 hour extension should not result in an unacceptably high chum catch and should fall well short of the June 16 - 18 sockeye allocation. This extension will enable the fishery to continue while the actual June 15 harvest is being evaluated, and further extensions can be considered if the harvest levels warrant. It is desirable to harvest as many allowable sockeye as possible while the sockeye to chum ratio is high.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-04-92

EFFECTIVE DATE: 2:00 P.M. June 16, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 2:00 P.M. June 17 in the South Unimak fishery. An 8:00 A.M. until 4:00 P.M. fishing period during June 17 is established for the Shumagin Island fishery.

JUSTIFICATION: The June 15 salmon harvest in the Shumagin Islands was 91,300 sockeye and 26,600 chums. The June 13 - 18 Shumagin Islands sockeye allocation of 151,000 should be reached in an eight hour period on June 17.

The June 15 reported harvest at South Unimak was 170,000 sockeye and 15,000 chums. Weather has slowed the fishery during June 16. The sockeye to chum ratio at South Unimak is unusually high (11.3 to 1) and more fishing time should be allowed while the ratio is high. If the sockeye to chum ratio drastically falls, the chum harvest will not be close to the 700,000 chum cap in such a short period of time. It is also not anticipated that the June 13 - 18 sockeye guideline harvest level of 686,000 fish will be surpassed by 2:00 P.M. June 17.

-Continued-

EMERGENCY ORDER NO. 4-F-M-SP-19-92

EFFECTIVE DATE: 3:00 P.M. June 16, 1992

EXPLANATION: This emergency order changes the required 36 hour notice as given in the Southeastern District Mainland (Alaska Peninsula Area) Salmon Management Plan, 1992, to a 24 hour notice prior to the first commercial salmon fishing period in the Southeastern District Mainland fishery: East Stepovak, Stepovak Flats, Northwest Stepovak, Southwest Stepovak, Balboa Bay and Beaver Bay Sections.

JUSTIFICATION: The Southeastern District Mainland fishery is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360.

The escapement of Chignik sockeye salmon through July 15 is 80,041 salmon. July 16 escapements should total an estimated 25,000 or more salmon. The July 16 cumulative escapement should be equal to or above the July 16 upper escapement goal of 100,000 salmon. Test fishing in Chignik Lagoon today resulted in an estimate of 100,000 salmon in the lagoon. It is anticipated that Chignik will have a commercial salmon opening soon.

A reduction in the required hours of notice prior to the first opening to 24 hours is necessary to allow for the optimum opportunity for Area M fishermen to harvest the 7% allocation of Chignik destined sockeye as outlined in the Southeastern District Management Plan.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-05-92

EFFECTIVE DATE: 2:00 P.M. June 17, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 2:00 P.M. June 18 in the South Unimak fishery.

JUSTIFICATION: The June 16 harvest at South Unimak was 173,000 sockeye and 30,000 chums. The sockeye to chum ratio at South Unimak is unusually high (5.8 to 1) and more fishing time should be allowed while the ratio is favorable. If the sockeye to chum ratio drastically falls, the chum harvest will not be close to the 700,000 chum cap in such a short period of time. The total catch through June 16 is 343,000 sockeye as compared to the period guideline harvest level of 686,000.

=====

EMERGENCY ORDER NO. 4-F-M-PM-02-92

EFFECTIVE DATE: 6:00 P.M. June 17, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Ilnik Section six (6) hours from 6:00 p.m. Wednesday, June 17 until 12:00 p.m. midnight Wednesday, June 17. The Bear River Section is extended 24 hours from 6:00 p.m. Wednesday June 17 until 6:00 p.m. Thursday June 18.

-Continued-

JUSTIFICATION: The Ilnik River weir escapement as of June 16 is 5,711 sockeye. The June 25 escapement goal is 8,000-12,000. At the present escapement levels of 700 sockeye/day, the minimum escapement should be reached by June 25.

The escapement through the Bear River weir on June 16 was 13,582 sockeye. The June 20 escapement goal is 5,000-15,000 sockeye. With the current escapement rate of 2,400 sockeye/day, the maximum escapement goal for June 20 should be exceeded.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-06-92

EFFECTIVE DATE: 12:01 A.M. June 19, 1992

EXPLANATION: This emergency order establishes a 12:01 A.M. until 10:00 P.M. commercial salmon fishing period in the South Unimak fishery during June 19. An 8:00 A.M. until 8:00 P.M. commercial salmon fishing period during June 19 is established for the Shumagin Islands fishery.

JUSTIFICATION: The June 13 - 18 sockeye guideline harvest level period in the Shumagin Islands Section has been exceeded. Another guideline harvest level period begins on June 19 and fishing time is needed to harvest the resource. In view of the extremely high catch of 114,000 sockeye in eight hours on June 17, fishing time will be limited to 12 hours to prevent the June 19 - 25 allocation of 195,000 fish from being exceeded in one day.

It is projected that the June 13 - 18 South Unimak guideline harvest level of 686,000 sockeye will be reached by 2:00 P.M. June 18. A reopening on June 19 will give the fleet an opportunity to harvest part of the June 19 - 25 guideline harvest level. The South Unimak fishery has demonstrated a need for more fishing time than is needed in the Shumagin Islands to harvest its allocation.

The combined South Unimak - Shumagin Islands chum catch is 132,000, well below the 700,000 cap.

=====

EMERGENCY ORDER NO. 4-F-M-SP-21-92

EFFECTIVE DATE: 8:00 A.M. June 19, 1992

EXPLANATION: This emergency order allows a 8:00 A.M. Friday, June 19 until 8:00 A.M. Saturday, June 20, 1992 salmon fishing period in the Southeastern District Mainland area: East Stepovak, Stepovak Flats, Northwest Stepovak (except for Orzinski Bay: all waters in Orzinski Bay north of a line from Elephant Point 55°41'55" N.lat., 160°03'12" W.long., to Waterfall Point 55°43'13" N.lat., 160°01'05" W.long.), Southwest Stepovak, Balboa Bay, and Beaver Bay Sections.

JUSTIFICATION: The Southeastern District Mainland fishery is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360.

As of 12:01 A.M. June 17, the sockeye escapement in Chignik is 109,201 salmon. As of 4:00 P.M. June 17 the commercial sockeye salmon catch in the Chignik Management Area is an estimated 150,000 salmon. Indications of run strength for the 1992 early Chignik sockeye stock show that at this time the run is about as strong as expected in the pre-season forecast.

-Continued-

A 8:00 A.M. Friday, June 19 until 8:00 A.M. Saturday, June 20 fishing period in the Southeastern District Mainland area will give fishermen the opportunity to catch their allocation (7% of the total Chignik destined harvest prior to July 26).

Orzinski Bay is managed on the strength of the sockeye salmon run into Orzinski Lake. The Orzinski Lake run usually does not begin until the end of June. Currently, no salmon have passed the Orzinski Lake weir, therefore Orzinski Bay will remain closed to commercial salmon fishing.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-07-92

EFFECTIVE DATE: 12:01 A.M. June 21, 1992

EXPLANATION: This emergency order closes the commercial salmon fishing season in the Uria Bay Section during the week of June 21 - 27.

JUSTIFICATION: The early portion of the Uria Bay sockeye run is weak. Only 7,000 sockeye were harvested during the present week when the harvest should have been approximately three times that level. A recent survey indicated that the escapement is poor. A week long closure should allow for more early fish to escape while allowing the fleet to harvest later sockeye which are anticipated to be much more numerous.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-08-92

EFFECTIVE DATE: 6:00 A.M. June 21, 1992

EXPLANATION: This emergency order establishes a 6:00 A.M. until 10:00 P.M. commercial salmon fishing period in the South Unimak fishery during June 21. An 8:00 A.M. until 12:00 Noon commercial salmon fishing period during June 21 is established for the Shumagin Islands fishery.

JUSTIFICATION: The Shumagin Islands sockeye harvest to date is 363,000. Based on harvest rates during June 19, it is estimated that the balance (37,000) of the June 19 - 25 allocation can be harvested in four hours.

The June 19 - 25 South Unimak sockeye harvest to date is about 350,000 fish, taken during June 19. A 16 hour fishery on June 21 is needed to harvest more of the 881,000 June 19 - 25 sockeye guideline harvest level.

The sockeye to chum ratios continue to be high. Approximately 275,000 chum salmon have been taken in the South Unimak - Shumagin Islands fisheries combined, well below the 700,000 cap.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-09-92

EFFECTIVE DATE: 10:00 P.M. June 21, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 16 hours until 2:00 P.M. June 22 in the South Unimak fishery.

-Continued-

JUSTIFICATION: There are 529,000 sockeye left to be taken in the June 19 - 25 guideline harvest level period at South Unimak. If catch levels decline to the 100,000 level or lower, fishing time will need to be maximized. The sockeye to chum ratio is reported to remain high by fishermen on the grounds. Catches are reported to be spotty. Even if the sockeye catch remains high, it is not anticipated that this periods guideline harvest level will be exceeded. Prior to this fishing period only 270,000 chums have been caught and the 700,000 chum cap should not be reached even if chum catches greatly increase.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-10-92

EFFECTIVE DATE: 11:00 A.M. June 22, 1992

EXPLANATION: This emergency order closes the Cape Lutke Section to commercial salmon fishing at 11:00 A.M. June 22, three hours earlier than the balance of the South Unimak fishery.

JUSTIFICATION: The South Unimak fishery is managed on the basis of a sockeye allocation. Large numbers of chum salmon have suddenly appeared in the Cape Lutke Section. A 700,000 chum salmon ceiling is placed on the South Unimak and Shumagin Islands fisheries combined. The Cape Lutke Section should be closed at this time in order to minimize the incidental chum salmon catch.

It is estimated from reports that the sockeye catch will be quite large, consequently the season allocation could be reached during this period. At any rate, it is likely that no more fishing time can be allowed in the Cape Lutke Section without greatly exceeding the sockeye allocation. Therefore, the Cape Lutke Section will remain closed for the duration of the time period covering the June fishery.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-11-92

EFFECTIVE DATE: 6:00 A.M. June 24, 1992

EXPLANATION: This emergency order reduces commercial salmon fishing time 48 hours each week to 6:00 A.M. Monday until 6:00 P.M. Wednesday each week in the Black Hills Section prior to July 12.

JUSTIFICATION: The Black Hills Section has been receiving intense fishing effort during recent years, especially when other nearby sections are closed. King salmon escapements have been declining. A reduction in fishing time to a 6:00 P.M. Wednesday closure each week during the king salmon run should greatly reduce fishing pressure.

=====

EMERGENCY ORDER NO. 4-F-M-PM-03-92

EFFECTIVE DATE: 6:00 P.M. June 24, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Ilnik Section, 24 hours from 6:00 p.m. Wednesday, June 24 until 6:00 p.m. Thursday, June 25. The Bear River Section is extended 24 hours from 6:00 p.m. Wednesday, June 24 until 6:00 p.m. Thursday, June 25. The Three Hills Section will open to commercial salmon fishing effective 12:01 a.m. Thursday, June 25 until 6:00 p.m. Thursday, June 25.

-Continued-

JUSTIFICATION: The Ilnik River weir escapement as of 2:00 p.m. June 23 is 13,880 sockeye salmon. The June 25 escapement goal is 8,000 - 12,000 and has been exceeded. Escapement through the weir has been increasing and peaked on June 22 with 1,797 salmon.

The escapement through the Bear River weir as of June 22 was 53,540 sockeye. The June 25 escapement goal is 15,000 - 40,000 sockeye and has been exceeded. The weir count peaked on June 22 with 13,821 salmon and has been increasing considerably over the past three days.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-04-92

EFFECTIVE DATE: 6:00 P.M. June 25, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Ilnik Section, from 6:00 p.m. Thursday, June 25 until 10:00 p.m. Friday, June 26. The Bear River and Three Hills Sections are extended 24 hours from 6:00 p.m. Thursday, June 25 until 6:00 p.m. Friday, June 26. The Herendeen-Moller Bay Section is extended 24 hours from 6:00 p.m. Thursday, June 25, to 6:00 p.m. Friday, June 26.

JUSTIFICATION: The Ilnik River weir escapement as of June 24 is 17,187 sockeye salmon. The June 25 escapement goal is 8,000 - 12,000 and has been exceeded. Escapement through the weir has been increasing and peaked yesterday, June 24 with 3,098 salmon. Effort in the Ilnik Section is presently 2-3 set gillnet boats.

The escapement through the Bear River weir, as of June 24, was 73,262 sockeye. The June 25 escapement goal of 15,000 - 40,000 sockeye has already been exceeded. The weir count has averaged 10,751 over the past four days, with yesterdays count of 8,242. The morning count, as of 8:45 a.m. June 25, was 1,000 sockeye and equivalent to yesterdays morning count. Effort in the Bear River and Three Hills Sections has increased over the past day to approximately 90-100 drift gillnet boats, and is expected to slow the escapement. Effort in the Herendeen-Moller Bay Section is presently one set gillnet.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-13-92

EFFECTIVE DATE: 12:00 P.M. Midnight, June 25, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time in the Nelson Lagoon Section 24 hours until 12:00 Midnight Friday during the week of June 21 - 27.

JUSTIFICATION: The sockeye escapement past Nelson River Tower is 15,000 fish through June 22 and daily escapements increase each day. At this rate, it appears that the June 30 escapement goal of 30,000 sockeye past the Nelson River Tower or weir will be easily reached. More fishing time is needed to harvest the resource.

-Continued-

EMERGENCY ORDER NO. 4-FS-M-CB-12-92

EFFECTIVE DATE: 12:00 A.M. Noon, June 26, 1992

EXPLANATION: This emergency order establishes a 5 hour 12:00 Noon until 5:00 P.M. commercial salmon fishing period during June 26 in that portion of the South Unimak fishery not included in closed waters under 5 AAC 09.350. The Cape Lutke Section and those waters around Sanak Island bounded by the latitude of Hague Rock are closed under 5 AAC 09.350 by previous emergency orders. A 12:00 Noon until 2:30 P.M. commercial salmon fishing period is established for the Shumagin Islands Section

JUSTIFICATION: There are only 34,000 sockeye left to be harvested in the South Unimak allocation and only 32,000 sockeye left to be harvested in the Shumagin Islands allocation. It is calculated, considering reduced fishing effort (the drift gillnet fleet is moving to Port Moller), reduced fishing area, and the peak of the sockeye run should be past, that only five hours fishing time will be required to harvest the balance of the sockeye allocation at south Unimak. The Shumagin Islands fishery has demonstrated that it can harvest its sockeye allocation much more easily than at South Unimak, therefore only 2-1/2 hours should be needed to reach the Shumagin season allocation.

It is anticipated that if the Cape Lutke Section was open, the South Unimak catch could greatly exceed the 34,000 sockeye left in the season allocation.

=====

EMERGENCY ORDER NO. 4-F-M-SP-22-92

EFFECTIVE DATE: 5:00 P.M. June 26, 1992

EXPLANATION: This emergency order allows a 5:00 P.M. Friday, June 26 until 5:00 P.M. Saturday, June 27, 1992 salmon fishing period in the Southeastern District Mainland area: East Stepovak, Stepovak Flats, Northwest Stepovak (except for Orzinski Bay: all waters in Orzinski Bay north of a line from Elephant Point 55°41'55" N.lat., 160°03'12" W.long., to Waterfall Point 55°43'13" N.lat., 160°01'05" W.long.), Southwest Stepovak, Balboa Bay, and Beaver Bay Sections.

JUSTIFICATION: The Southeastern District Mainland fishery is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360.

As of 12:01 A.M. June 25, the sockeye escapement in Chignik is 351,477 salmon. As of 10:00 P.M. June 24 the commercial sockeye salmon catch to date in the Chignik Management Area is an estimated 250,000 salmon. The Chignik Bay, Central, and Eastern Districts of the Chignik Management Area are open until further notice. Indications of run strength and timing for the 1992 early Chignik sockeye stock show that at this time the run is believed to be weaker than forecast (preseason forecasted early run harvest of 1.40 million sockeye), may well be running late, but will meet the objectives of the Southeastern District Salmon Management Plan in regards to escapement goals and commercial catch allocations within each management area.

The Cape Igvak Section of the Kodiak Management Area will have a 40 hour fishing period to run from 8:00 A.M. Friday, June 26 until 12:01 A.M. Sunday, June 28.

-Continued-

A 5:00 P.M. Friday, June 26 until 5:00 P.M. Saturday, June 27 fishing period in the Southeastern District Mainland area will give fishermen the opportunity to catch their allocation (7% of the total Chignik destined harvest prior to July 26).

Orzinski Bay is managed on the strength of the sockeye salmon run into Orzinski Lake. The Orzinski Lake run usually does not begin until the end of June. Currently, no salmon have passed the Orzinski Lake weir, therefore Orzinski Bay will remain closed to commercial salmon fishing.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-05-92

EFFECTIVE DATE: 10:00 P.M. June 26, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Ilnik Section, from 10:00 p.m. Friday, June 26 until 10:00 p.m. Saturday, June 27.

JUSTIFICATION: The Ilnik River weir escapement as of June 25 is 18,977 sockeye salmon. The June 25 escapement goal is 8,000 - 12,000. The July 1 escapement goal is 16,000 - 24,000. At the previous five-day average of 1,910 sockeye/day, the maximum goal for July 1 should be exceeded. The escapement on June 25 was the third highest this season. Effort in the Ilnik Section is presently 2-3 set gillnet boats.

=====

EMERGENCY ORDER NO. 4-F-M-SP-23-92

EFFECTIVE DATE: 1:00 A.M. June 28, 1992

EXPLANATION: This emergency order changes the required 24 hour notice to a 12 hour notice given prior to a commercial salmon fishing period in the Southeastern District Mainland area: East Stepovak, Stepovak Flats, Northwest Stepovak, Southwest Stepovak, Balboa Bay, and Beaver Bay Sections.

JUSTIFICATION: The Southeastern District Mainland fishery is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360.

The harvest of Chignik bound sockeye through June 26 in the Chignik Area is an estimated 377,809 salmon, in the Cape Igvak Section of the Kodiak Management is an estimated 48,260 salmon and in the Mainland area of the Alaska Peninsula Management Area is an estimated 33,512 salmon. As of midnight June 26 the sockeye salmon escapement past the Chignik weir totaled 374,722 salmon. Fishermen report that catches in the Chignik Area continue to improve. The Cape Igvak, Chignik, and Southeastern District Mainland fisheries are open today, June 27. Indications of run strength and timing for the 1992 early Chignik sockeye stock show that at this time the run is believed to be weaker than forecast (preseason forecasted early run harvest of 1.40 million sockeye) and may well be running late.

To meet the objectives of the Southeastern District Salmon Management Plan in regards to commercial catch allocations within each management area it may be necessary to have an additional commercial salmon fishing period in the Southeastern District Mainland area.

-Continued-

If additional fishing time is provided in the Mainland area, the fishing period should be as soon as possible so that any harvest would be from the early run of Chignik sockeye salmon.

EMERGENCY ORDER NO. 4-FS-M-CB-14-92

EFFECTIVE DATE: 6:00 A.M. June 29, 1992

EXPLANATION: This emergency order reduces the commercial salmon fishing period 24 hours to 6:00 A.M. Monday to 6:00 P.M. Wednesday during the week of June 28 - July 4 in the Uria Bay and Swanson Lagoon Sections.

JUSTIFICATION: Due to the closure of the South Peninsula fisheries, a large increase in fishing effort is anticipated in the Uria Bay and Swanson Lagoon Sections during the week of June 28 - July 4. The strength of the Swanson Lagoon and Uria Bay sockeye and chum runs isn't known at this time. The fishing period should be reduced until run strength and escapement levels can be assessed.

EMERGENCY ORDER NO. 4-F-M-SP-24-92

EFFECTIVE DATE: 10:00 A.M. June 29, 1992

EXPLANATION: This emergency order allows a 10:00 A.M. Monday, June 29 until 8:00 P.M. Monday, June 29, 1992 salmon fishing period in the Southeastern District Mainland area: East Stepovak, Stepovak Flats, Northwest Stepovak (except for Orzinski Bay: all waters in Orzinski Bay north of a line from Elephant Point 55°41'55" N.lat., 160°03'12" W.long., to Waterfall Point 55°43'13" N.lat., 160°01'05" W.long.), Southwest Stepovak, Balboa Bay, and Beaver Bay Sections.

JUSTIFICATION: The Southeastern District Mainland fishery is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360.

As of 12:01 A.M. June 28, the sockeye escapement in Chignik is 375,508 salmon. As of midnight June 27 the commercial sockeye salmon catch to date in the Chignik Management Area is an estimated 458,582 salmon. The Chignik Bay, Central, and Eastern Districts of the Chignik Management Area are open until further notice. Indications of run strength and timing for the 1992 early Chignik sockeye stock show that at this time the run is believed to be weaker than forecast (preseason forecasted early run harvest of 1.40 million sockeye), may well be running late, but will meet the objectives of the Southeastern District Salmon Management Plan in regards to escapement goals and commercial catch allocations within each management area.

As of midnight June 27 the commercial sockeye salmon catch to date in the Cape Igvak Section of the Kodiak Management Area is an estimated 72,270 sockeye salmon, the Cape Igvak Section will be open until 9:00 P.M. Tuesday, June 30.

A 10:00 A.M. Monday, June 29 until 8:00 P.M. Monday, June 29 fishing period in the Southeastern District Mainland area will give fishermen the opportunity to catch their allocation (7% of the total Chignik destined harvest prior to July 26).

-Continued-

Orzinski Bay is managed on the strength of the sockeye salmon run into Orzinski Lake. The Orzinski Lake cumulative sockeye escapement through 12:01 AM June 28 is 501 salmon. The July 1 escapement goal is 2,000 sockeye salmon. Currently, not enough salmon have passed the Orzinski Lake weir to warrant opening Orzinski Bay to commercial salmon fishing.

=====

EMERGENCY ORDER NO. 4-F-M-SP-25-92

EFFECTIVE DATE: 10:00 A.M. June 29, 1992

EXPLANATION: This emergency order allows a 10:00 A.M. Monday, June 29 until 8:00 P.M. Monday, June 29, 1992 salmon fishing period in Orzinski Bay: all waters in Orzinski Bay north of a line from Elephant Point (55°41'55" N.lat., 160°03'12" W.long.) to Waterfall Point (55°43'13" N.lat., 160°01'05" W.long.).

JUSTIFICATION: The Southeastern District Mainland fishery, except for Orzinski Bay, is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360.

As of 12:01 A.M. June 29, the cumulative sockeye escapement past the Orzinski Lake weir was 1,756 salmon. The daily escapement on June 28 was 1,255 sockeye salmon. The first escapement goal into Orzinski Lake is 2,000 sockeye salmon by 1 July.

A 10:00 A.M. Monday, June 29 until 8:00 P.M. Monday, June 29 fishing period in Orzinski Bay will coincide with a commercial salmon fishing period in the remainder of the Southeastern District Mainland area. An opening at this time will spread the fleet throughout the Southeastern District Mainland area.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-15-92

EFFECTIVE DATE: 6:00 A.M. July 1, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 48 hours until 6:00 P.M. Friday during the week of June 28 - July 4 in the Inner Port Heiden Section.

JUSTIFICATION: Fishing effort in the Inner Port Heiden Section consists of less than four set gillnet operations and fishermen must transport their fish to Port Moller. Catch per unit effort on June 30 was 300 sockeye which indicates a strong run. In view of the light effort and good catch per unit effort, more fishing time can be allowed at this time without endangering the resource.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-06-92

EFFECTIVE DATE: 6:00 P.M. July 2, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Bear River and Three Hills Sections 24 hours from 6:00 p.m. Thursday, July 2 until 6:00 p.m. Friday, July 3. That portion of the Herendeen-Moller Bay Section enclosed by a line from Entrance Point to Harbor Point is extended 24 hours from 6:00 p.m. Thursday, July 2 to 6:00 p.m. Friday, July 3.

-Continued-

JUSTIFICATION: The escapement through the Bear River weir, as of June 30, was 103,087 sockeye. The July 5 interim escapement goal of 80,000 - 100,000 sockeye has already been exceeded. The weir count averaged 8,424 sockeye over the past two days, with yesterdays count of 7,756. Effort in the Bear River and Three Hills Sections is approximately 150 boats and is expected to slow the escapement considerably. Effort in that portion of the Herendeen-Moller Bay Section enclosed by a line from Entrance Point to Harbor Point consists of one or two set gill net boats.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-16-92

EFFECTIVE DATE: 12:00 P.M. Midnight, July 2, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time in the Nelson Lagoon Section 24 hours until 12:00 P.M. Friday during the week of June 28 - July 4.

JUSTIFICATION: The sockeye escapement through Nelson River weir is 51,000. It appears that the July 5 escapement target of 65,000 can be reached while allowing an additional 24 hours of fishing time.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-07-92

EFFECTIVE DATE: 6:00 P.M. July 3, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Bear River and Three Hills Sections 24 hours from 6:00 p.m. Friday, July 3 until 6:00 p.m. Saturday, July 4. That portion of the Herendeen-Moller Bay Section enclosed by a line from Entrance Point to Harbor Point is extended 24 hours from 6:00 p.m. Friday, July 3 to 6:00 p.m. Saturday, July 4.

JUSTIFICATION: The escapement through the Bear River weir, as of July 2 was 107,382 sockeye. The daily weir count has decreased considerably for the past four days, down to 1,104 sockeye on July 2. Effort in the Bear River and Three Hills Sections is approximately 150 - 175 boats and is expected to slow the escapement. Effort in that portion of the Herendeen-Moller Bay Section enclosed by a line from Entrance Point to Harbor Point consists of one or two set gill net boats. Therefore, based on the current total escapement through July 2, which has exceeded the desired escapement goal for July 5 of 80,000 - 100,000, and the daily commercial harvest rate indicating more fish are en route, it is appropriate to extend these areas. This extension will provide the optimum opportunity to harvest sockeye salmon surplus to the escapement needs while maintaining the desired escapement goals.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-08-92

EFFECTIVE DATE: 12:00 Noon, July 4, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Bear River and Three Hills Sections until 6:00 p.m. Thursday, July 16, and reduces the closed waters at Bear River to the stream terminus at the ocean shoreline between 12:00 noon July 4 until 6:00 p.m. July 16. That portion of the Herendeen-Moller Bay Section enclosed by a line from Entrance Point to Harbor Point is extended until 6:00 p.m. Thursday, July 16.

-Continued-

JUSTIFICATION: The escapement through the Bear River weir, as of July 3 was 124,048 sockeye. The daily weir count yesterday was 16,666. The stream terminus at the ocean shoreline of the Bear River is open to more effectively control the escapement. More fishing time is needed to reduce the escapement. Based on the current total escapement through July 3, which has exceeded the desired escapement goal for July 15 of 110,000 - 125,000, and the daily commercial harvest rate indicating more fish are en route, it is appropriate to extend these areas and provide the optimum opportunity to harvest sockeye salmon surplus to the escapement needs while preventing over-escapement.

=====

EMERGENCY ORDER NO. 4-F-M-SP-26-92

EFFECTIVE DATE: 6:00 A.M. July 6, 1992

EXPLANATION: This emergency order reduces the closed waters at Orzinski River to the stream terminus at the ocean shoreline from 6:00 A.M. Monday, July 6 until 12:01 A.M. Thursday, July 16, 1992.

JUSTIFICATION: The Southeastern District Mainland fishery, except for Orzinski Bay, is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360.

The escapement through the Orzinski Lake weir, as of 8:00 P.M. July 5 was about 9,000 sockeye salmon. The daily weir count through 8:00 P.M. today, July 5 was 4,100 sockeye salmon and the river is reported to be full of salmon. The July 9 escapement goal is 5,000 salmon and the July 16 escapement goal is 10,000 salmon.

A 6:00 A.M. Monday, July 6 until 10:00 P.M. Monday, July 6 fishing period has been announced for Orzinski Bay.

Based on the current escapement and the ADF&G report of many more fish in the river it is appropriate to reduce the closed waters at Orzinski River to the stream terminus at the ocean shoreline until July 16 when the cumulative escapement goal requirement is increased to 10,000 salmon.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-17-92

EFFECTIVE DATE: 6:00 A.M. July 6, 1992

EXPLANATION: This emergency order reduces commercial salmon fishing time 48 hours to 6:00 A.M. Monday until 6:00 P.M. Tuesday during the week of July 5 - 11 in the Uria Bay and Swanson Lagoon Sections. A 6:00 A.M. Monday July 6 until 6:00 P.M. Tuesday July 7 commercial salmon fishing period is established for the Bechevin Bay Section.

The closed waters of Peterson Lagoon are expanded to include all waters over 750 yards upstream from the lagoon entrance.

JUSTIFICATION: Recent surveys of Christianson's Lagoon (at Uria Bay) and Swanson Lagoon indicated there was escapement but it was difficult to tell how strong the escapements were due to water conditions. The previous weeks catches

-Continued-

indicated sockeye and chum runs were healthy. A 36 hour fishing period during July 6 - 7 will allow the fleet to harvest salmon and test run strength while still allowing plenty of closed time to get escapements. Chum salmon are now entering Bechevin Bay, and a 36 hour fishing period during July 6 -7 will allow fishermen to test run strength.

Salmon in the upper portion of Peterson Lagoon are needed for escapement and are of very poor quality. Closing the upper portion of the lagoon is needed to achieve proper sockeye and chum escapements and to prevent salmon wastage.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-18-92

EFFECTIVE DATE: 6:00 A.M. July 6, 1992

EXPLANATION: This emergency order establishes a 6:00 A.M. until 10:00 P.M. commercial salmon fishing period in the following locations:

1. Morzhovoi Bay Section
2. Thin Point Bay Section
3. Cold Bay Section
4. Canoe Bay Section
5. That portion of the Pavlof Bay section located north of the latitude of Black Point.
6. Zachary Bay located south of 55⁰22'39" N. lat.
7. Orzinski Bay

JUSTIFICATION: South Peninsula sockeye and chum salmon should be entering locations where fishing is allowed under the post June Management Plan prior to July 20 in that portion of the South Peninsula located outside the Southeastern District Mainland. The Orzinski Bay sock-eye weir count through July 2 is 2,700, there is presently good sign of fish in the bay and it appears likely that the July 9 target of 5,000 escapement will be easily reached. A short opening at this time will allow the fleet to harvest salmon and test run strength. Due to the relatively small area that is open to commercial salmon fishing on the South Peninsula, effort is expected to be intense.

=====

EMERGENCY ORDER NO. 4-F-M-SP-27-92

EFFECTIVE DATE: 10:00 P.M. July 6, 1992

EXPLANATION: This emergency order allows a 10:00 P.M. Monday, July 6 until 12:01 A.M. Thursday, July 16, 1992 salmon fishing period in Orzinski Bay: all waters in Orzinski Bay north of a line from Elephant Point (55⁰41'55" N.lat., 160⁰03'12" W.long.) to Waterfall Point (55⁰43'13" N.lat., 160⁰01'05" W.long.).

JUSTIFICATION: The Southeastern District Mainland fishery, except for Orzinski Bay, is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360.

As of 12:01 A.M. July 5, the cumulative sockeye escapement past the Orzinski Lake weir was 10,184 salmon. The daily escapement on July 5 was 5,285 sockeye salmon. The July 16 escapement goal for Orzinski Lake is 10,000 sockeye salmon.

-Continued-

Currently, Orzinski Bay is open to commercial salmon fishing from 6:00 A.M. Monday, July 6 until 10:00 P.M. Monday, July 6, and the closed waters at the stream terminus have been reduced to the ocean shoreline.

A 10:00 P.M. Monday, July 6 until 12:01 A.M. Thursday, July 16 opening for Orzinski Bay is appropriate because the escapement goal through July 16 has been achieved.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-19-92

EFFECTIVE DATE: 12:00 P.M. Midnight, July 9, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time in the Nelson Lagoon Section 24 hours until 12:00 P.M. Friday during the week of July 5-11.

JUSTIFICATION: The sockeye salmon escapement past the Nelson River Tower is 90,000 which is at the goal level through July 10. The harvest in Nelson Lagoon increased from 10,000 sockeye on July 7 to 19,000 on July 8 indicating that the run is increasing. A 24 hour extension can be allowed at this time while still reaching the season escapement goal range of 100,000 to 150,000.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-21-92

EFFECTIVE DATE: 6:00 A.M. July 12, 1992

EXPLANATION: This emergency order opens the commercial salmon fishing period 24 hours earlier than scheduled in the Inner Port Heiden and Nelson Lagoon Sections. After 6:00 A.M. July 12, commercial salmon fishing will be allowed continuously through July 31 in the Inner Port Heiden Section.

JUSTIFICATION: A total of 12,700 sockeye were counted in a recent aerial survey of the Meshik River. This is within the escapement goal range of 10,000 to 20,000. Many of the fish were observed in the lower end which indicates the escapement should go much higher. Fishing effort consists of only two set gillnet fishermen. More fishing time is needed to harvest the resource.

The Nelson Lagoon sockeye escapement is on target at 92,000 adult fish through July 10. The daily adult sockeye count for July 10 was 6,733 and indications are that the July 11 count will be similar. with reports of exceptional landings in the Nelson Lagoon fishery, it is anticipated that the escapement may exceed the season goal if the fishery is not reopened early.

=====

EMERGENCY ORDER NO. 4-F-M-SP-28-92

EFFECTIVE DATE: 6:00 A.M. July 13, 1992

EXPLANATION: This emergency order establishes a 6:00 A.M. Monday, July 13 until 10:00 P.M. Tuesday, July 14, 1992 salmon fishing period in the following locations:

1. Otter Cove Section of the Unimak District
2. Sanak Island Section of the Unimak District

-Continued-

-
3. Southwestern District
 4. South Central District
 5. Shumagin Islands Section of the Southeastern District

This emergency order also establishes a 6:00 A.M. Monday, July 13 until 10 P.M. Monday, July 13, 1992 salmon fishing period in the following location:

1. Stepovak Flats Section of the Southeastern District

JUSTIFICATION: In accordance with the order issued on Friday, July 10, 1992 by Alaska State Superior Court Judge Hopwood (Third Judicial District, Kodiak) in Stepovak-Shumagin Set Net Association v. State of Alaska Board of Fisheries, Case No. 3KO-92-239 CI, which granted plaintiff Stepovak-SSNA and injunction staying the enforcement of 5AAC 09.366 (the Post-June Salmon Management Plan of the Southern Alaska Peninsula), commercial salmon fishing will commence in South Alaska Peninsula waters.

Fishing time is needed to harvest South Peninsula chum and pink salmon stocks and to test run strength. Early indications of pink salmon run strength show that the 1992 forecasted catch of 6,000,000 pink salmon from South Peninsula waters may be near the expected catch. Early indications include: 1) the June South Peninsula pink salmon catch of 620,005 salmon, 2) although to date only a few pink salmon have been harvested in North Peninsula waters the fact that any pink salmon have been caught is noteworthy, 3) in Kodiak waters early pink salmon catches indicate a strong run (9,220,000 forecasted harvest) and the salmon are averaging 3.5 to 4.0 pounds, 5) pink salmon caught in Orzinski Bay by set gill net gear have averaged 3.7 pounds per fish during July, 6) in Zachary Bay during a fishing period on July 6 pink salmon averaged 3.4 pounds per fish from purse seine and set gill net deliveries, and 7) subsistence fishermen have reported large, 3.5 to 4.0 pound, pink salmon in their catches.

Currently, ADF&G does not anticipate immature salmon to be a concern for purse seine gear in South Peninsula waters. Subsistence fishermen report very few (about 3 immature salmon) per set in the Popof Head to Red Bluff area of Popof Island.

ADF&G is test fishing today with commercial purse seine gear in the Popof Head to Red Bluff area of Popof Island to determine the possible presence, species composition, and abundance of any immature salmon in the Shumagin Islands Section.

It is the desire of the court to return to prior years July style of management for the South Peninsula, a 40 hour commercial salmon fishing period for all gear types (drift gill net, set gill net, and purse seine gear) would be similar to fishing periods for this date in prior years. Delaying the opening until 6:00 A.M. Monday will provide reasonable time for the fishing fleet and processors to prepare for the fishery and will allow an additional day (Saturday, July 11) to test fish for possible immature salmon. Closure of the fishery after 40 hours will provide ADF&G time to evaluate the run strength of pink and chum salmon.

The Southeastern District Mainland fishery is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360. The Southeastern District Salmon Management Plan also provides fishing opportunities to harvest the local run of chum salmon in the Stepovak Flats Section of the district. A 16 hour opening from 6:00 A.M. until 10:00 P.M. on Monday, July 13 will provide an opportunity to harvest chum salmon in the Stepovak Flats Section; 80 percent of the sockeye salmon harvested during the fishing period will be considered destined for the Chignik River system.

EMERGENCY ORDER NO. 4-FS-M-CB-20-92

EFFECTIVE DATE: 6:00 A.M. July 13, 1992

EXPLANATION: This emergency order closes the commercial salmon fishing season in the following locations:

1. Swanson Lagoon, the Swanson Lagoon outlet channel and all waters within 500 yards of the outlet channel terminus.
2. Christianson Lagoon outlet channel and all waters within 500 yards of the outlet channel terminus.

A 6:00 A.M. July 13 until 10:00 P.M. July 14 commercial salmon fishing period is established in the Bechevin Bay Section.

JUSTIFICATION: Fishing time is needed to harvest Bechevin Bay chum salmon and to test run strength.

Escapements of sockeye and chum salmon into Christianson and Swanson Lagoons are questionable. Closure of the terminal areas will protect salmon needed for escapement while allowing fishermen to harvest salmon moving to other streams in the Urelia Bay and Swanson Lagoon Sections.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-09-92

EFFECTIVE DATE: 6:00 A.M. July 13, 1992

EXPLANATION: This emergency order closes the commercial salmon fishing period in the Ilnik Section, from 6:00 a.m. Monday, July 13 until 12:00 midnight July 14, 1992.

JUSTIFICATION: The Ilnik River weir escapement as of July 11 is 36,765. The weir washed out on the morning of July 12, making counting the escapement accurately for the final days of the run impossible. The previous seven day daily escapement average of 1,245 sockeye would put the escapement at approximately 40,000 on Wednesday, July 15. The season minimum escapement goal for Ilnik River is 40,000. The travel time from the fishery to the weir is at least one day, allowing the minimum escapement goal to be reached on July 15, which is the estimated end of the Ilnik River run.

Since Ugashik River has a conservation concern and escapement to date is poor, approximately 7,206, the Ilnik Section will not open any earlier than July 15 unless both the Ilnik and Ugashik Rivers escapement dramatically improve. Post July 15, any further openings in the Ilnik Section will be based on whether a conservation problem still exists in Ugashik River, and based on the July 16 - August 5 escapement goal for Bear River.

=====

EMERGENCY ORDER NO. 4-F-M-SP-29-92

EFFECTIVE DATE: 12:01 A.M. July 16, 1992

EXPLANATION: This emergency order extends the time period of the reduced closed waters at Orzinski River to the stream terminus at the ocean shoreline until 10:00 P.M. Sunday, July 19, 1992.

-Continued-

This emergency order extends the commercial salmon fishing period until 10:00 P.M. Sunday, July 19, 1992 in Orzinski Bay: all waters in Orzinski Bay north of a line from Elephant Point (55°41'55" N.lat., 160°03'12" W.long.) to Waterfall Point (55°43'13" N.lat., 160°01'05" W.long.).

JUSTIFICATION: The Southeastern District Mainland fishery, except for Orzinski Bay and the Stepovak Flats Section, is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360.

The escapement through the Orzinski Lake weir, as of 12:00 P.M., midnight, July 13 was 12,881 sockeye salmon. During July 6-13 Orzinski Bay has been open to continuous salmon fishing and the closed waters has been reduced to the stream terminus at the ocean shoreline. Daily escapement through the weir has averaged 330 sockeye salmon since July 6. The July 16 escapement goal of 10,000 salmon has been exceeded by 2,881 salmon. The July 23 escapement goal is 15,000 salmon. Continuous salmon fishing through July 19 is needed to harvest salmon that are excess to escapement requirements.

=====
EMERGENCY ORDER NO. 4-FS-M-PM-10-92

EFFECTIVE DATE: 6:00 P.M. July 16, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Bear River and Three Hills Sections from 6:00 p.m. Thursday, July 16 until 6:00 p.m. Friday, July 17, and reduces the closed waters at Bear River to the stream terminus at the ocean shoreline. That portion of the Herendeen-Moller Bay Section enclosed by a line from Entrance Point to Harbor Point is extended from 6:00 p.m. Thursday, July 16 until 6:00 p.m. Friday, July 17. The Ilnik Section will reopen to commercial salmon fishing for 24 hours effective 6:00 p.m. Thursday, July 16 and close 6:00 p.m. Friday, July 17.

JUSTIFICATION: Post-July 15, the Bear River, Three Hills and Ilnik Sections are managed on the basis of Bear River stocks. The escapement through the Bear River weir, as of July 15 is 186,558 sockeye. The July 15 maximum goal is 125,000. The daily weir count yesterday was 8,307 and averaged 7,370 fish over the past two days. The weir count as of 8:45 a.m., July 16 indicates another strong escapement for today. The July 16 - August 5 escapement goal of 40,000 - 50,000 will be exceeded at the present escapement rate if more fishing time is not allowed. The stream terminus at the ocean shoreline of the Bear River will remain open to more effectively control the escapement. The daily commercial harvest rate indicates more fish are en route, and it is appropriate to extend these areas and provide the optimum opportunity to harvest sockeye salmon surplus to the escapement needs while preventing over-escapement.

=====
EMERGENCY ORDER NO. 4-FS-M-CB-22-92

EFFECTIVE DATE: 12:00 P.M. Midnight, July 16, 1992

EXPLANATION: This emergency order allows continuous commercial salmon fishing time in the Nelson Lagoon Section until 12:00 P.M. Friday July 24.

JUSTIFICATION: The escapement of sockeye through the Nelson River weir is 128,000 (not including jacks), which is at the midpoint of the goal range. More fishing time is needed to harvest the resource.

-Continued-

EMERGENCY ORDER NO. 4-FS-M-PM-11-92

EFFECTIVE DATE: 6:00 P.M. July 17, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Bear River and Three Hills Sections from 6:00 p.m. Friday, July 17 until 6:00 a.m. Monday, July 20, and reduces the closed waters at Bear River to the stream terminus at the ocean shoreline. That portion of the Herendeen-Moller Bay Section enclosed by a line from Entrance Point to Harbor Point is extended from 6:00 p.m. Friday, July 17 until 6:00 a.m. Monday, July 20. The Ilnik Section is extended from 6:00 p.m. Friday, July 17 until 6:00 a.m. Monday, July 20.

JUSTIFICATION: Post-July 15, the Bear River, Three Hills and Ilnik Sections are managed on the basis of Bear River stocks. The escapement through the Bear River weir, as of July 16 is 198,175 sockeye. The daily weir count on July 16 was 11,617 and averaged 8,785 fish over the past three days. The July 16 - August 5 escapement goal of 40,000 - 50,000 will be exceeded at the present escapement rate if more fishing time is not allowed. The stream terminus at the ocean shoreline of the Bear River will remain open to more effectively control the escapement. The daily commercial harvest rate indicates more fish are en route, and it is appropriate to extend these areas and provide the optimum opportunity to harvest sockeye salmon surplus to the escapement needs while preventing over-escapement.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-24-92

EFFECTIVE DATE: 6:00 A.M. July 18, 1992

EXPLANATION: This emergency order closes the Shumagin Island Section and that portion of the Sanak Island Section located over four nautical miles from the southernmost tip of Chicago Point to commercial salmon fishing with seines during the July 18 - 19 fishing period.

JUSTIFICATION: Large numbers of immature salmon have appeared in the Shumagin Islands. These fish gill in seines and are a waste of the resource. Test catches on July 17 contained over 1,000 immature salmon per set. In the past, large numbers of immature salmon have been taken by several seiners in the Sanak Island Section. Closure of the Shumagins may cause a large movement of seiners to capes along Sanak Island. This could result in a huge resource loss on an area too remote to monitor. Allowing seiners to fish within four nautical miles of Chicago Point will give them the opportunity to harvest local sockeye and pinks in an area where immature salmon are likely absent.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-23-92

EFFECTIVE DATE: 10:00 A.M. July 18, 1992

EXPLANATION: This emergency order establishes a 10:00 A.M. July 18 until 10:00 P.M. July 19 commercial salmon fishing period in the following locations:

- | | |
|-----------------------------|--------------------------|
| 1. Stepovak Flats Section | 4. Southwestern District |
| 2. Shumagin Islands Section | 5. Sanak Island Section |
| 3. South Central District | 6. Otter Cove Section |

-Continued-

JUSTIFICATION: The July 13 - 14 South Peninsula harvest of 92,000 chums indicated a strong run of local chum salmon is in progress. The catch of 51,000 pink salmon was good for this date. A fishing period during July 18 - 19 is needed to harvest chum salmon and to further test pink salmon run strength.

=====

EMERGENCY ORDER NO. 4-F-M-SP-30-92

EFFECTIVE DATE: 10:00 P.M. July 19, 1992

EXPLANATION: This emergency order extends the time period of the reduced closed waters at Orzinski River to the stream terminus at the ocean shoreline until 12:00 A.M. noon, Thursday, July 23, 1992.

This emergency order extends the commercial salmon fishing period until 12:00 A.M. noon, Thursday, July 23, 1992 in Orzinski Bay: all waters in Orzinski Bay north of a line from Elephant Point (55°41'55" N.lat., 160°03'12" W.long.) to Waterfall Point (55°43'13" N.lat., 160°01'05" W.long.).

JUSTIFICATION: The Southeastern District Mainland fishery, except for Orzinski Bay and the Stepovak Flats Section, is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360.

The escapement through the Orzinski Lake weir, as of 12:00 P.M., midnight, July 17 was 14,631 sockeye salmon. During July 6-18 Orzinski Bay has been open to continuous salmon fishing and the closed waters has been reduced to the stream terminus at the ocean shoreline. Daily escapement through the weir has averaged 397 sockeye salmon over the past week (July 11-17). It is anticipated that the July 23 escapement goal of 15,000 salmon will be exceeded. Continuous salmon fishing through July 23 is needed to harvest salmon that are excess to escapement requirements.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-25-92

EFFECTIVE DATE: 6:00 A.M. July 20, 1992

EXPLANATION: This emergency order establishes a 6:00 A.M. July 20 until 10:00 P.M. July 21 commercial salmon fishing period in the Bechevin Bay Section.

JUSTIFICATION: Chum salmon are entering Mike's Creek in St. Catherine Cove in good numbers. The estimated 7,500 escapement is well above average for this date. A fishing period during July 20 - 21 is needed for the fleet to harvest the resource.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-12-92

EFFECTIVE DATE: 6:00 A.M. July 20, 1992

EXPLANATION: This emergency order reduces the closed waters at Bear River to the stream terminus at the ocean shoreline from 6:00 a.m. Monday, July 20 until 6:00 p.m. Thursday, July 23.

-Continued-

JUSTIFICATION: The overall season escapement goal for Bear River is 200,000 -250,000 sockeye by August 31. The present escapement is 213,530 sockeye. The July 16 - August 5 escapement goal for Bear River weir is 40,000 - 50,000 sockeye salmon. As of July 18, the escapement through the weir for the July 16 - August 5 goal is 26,972 sockeye and averaging 8,991 sockeye/day. The July 16 - August 5 escapement goal of 40,000 - 50,000 will be exceeded at the present escapement rate. Opening the stream terminus to the ocean shoreline of the Bear River will more effectively control the escapement. The daily commercial harvest rate indicates more fish are en route, and it is appropriate to open the Bear River to the stream terminus to the ocean shoreline to provide the optimum opportunity to harvest sockeye salmon surplus to the escapement needs while preventing over-escapement.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-13-92

EFFECTIVE DATE: 6:00 P.M. July 22, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Bear River and Three Hills Sections from 6:00 p.m. Thursday, July 23 until 6:00 p.m. Thursday, August 6, and reduces the closed waters at Bear River to the stream terminus at the ocean shoreline. That portion of the Herendeen-Moller Bay Section enclosed by a line from Entrance Point to Harbor Point is extended from 6:00 p.m. Thursday, July 23 until 6:00 p.m. Thursday, August 6. The Ilnik Section is extended from 6:00 p.m. Wednesday, July 22 until 6:00 p.m. Thursday, August 6.

JUSTIFICATION: Post-July 15, the Bear River, Three Hills and Ilnik Sections are managed on the basis of Bear River stocks. The escapement through the Bear River weir, as of July 21 is 226,342 sockeye. The July 16 - August 5 escapement goal is 40,000 - 50,000 sockeye salmon. The minimum escapement goal for July 16 - August 5 has been exceeded (42,084) as of 8:45 a.m. July 22. Weir counts have averaged 6,631 sockeye/day since the new goal started on July 16. The upper goal may be substantially exceeded if more fishing time is not allowed. The stream terminus at the ocean shoreline of the Bear River will remain open (since July 4) to more effectively control the escapement. The daily commercial harvest rate indicates more fish are en route, and it is appropriate to extend these areas and provide the optimum opportunity to harvest sockeye salmon surplus to the escapement needs while preventing over-escapement.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-26-92

EFFECTIVE DATE: 10:00 A.M. July 23, 1992

EXPLANATION: This emergency order establishes a 10:00 A.M. July 23 until 10:00 P.M. July 25 commercial salmon fishing period in the following location:

- | | |
|-----------------------------|--------------------------|
| 1. Stepovak Flats Section | 5. Sanak Island Section |
| 2. Shumagin Islands Section | 6. Otter Cove Section |
| 3. South Central District | 7. Aleutian Islands Area |
| 4. Southwestern District | |

Due to the presence of immature salmon which gill in seines, seining will not be allowed in the Shumagin Islands Section, that part of the Southwestern District

-Continued-

located within one nautical mile of Poperechnoi Island, and that portion of the Sanak Island section located outside of a 4 nautical mile radius of Chicago Point.

JUSTIFICATION: Pink salmon are entering South Peninsula and Aleutian Islands waters at this time. A large pink salmon run is anticipated and early indications are that the run will be strong. The local chum salmon runs appear to be at least moderately strong. Fishing time is needed to harvest the resource.

Large numbers of immature salmon are present in the Shumagin Islands. These fish gill in seines and are a major wasted resource if seine gear is allowed to operate when immature salmon are present in large numbers. Substantial numbers of immature salmon were also reported from Poperechnoi Island during the July 18 - 19 fishing period. In the past, large numbers of immature salmon have been taken by seiners in the Sanak Island Section. The closure of the Shumagins to seining could cause a large movement of seiners to capes along Sanak Island which could cause a large resource loss in an area too remote to monitor. Allowing seiners to fish within four nautical miles of Chicago Point will give them the opportunity to harvest pinks in an area where immature salmon are likely absent.

=====

EMERGENCY ORDER NO. 4-F-M-SP-31-92

EFFECTIVE DATE: 12:00 A.M. Noon, July 23, 1992

EXPLANATION: This emergency order extends the time period of the reduced closed waters at Orzinski River to the stream terminus at the ocean shoreline until 10:00 P.M. Saturday, July 25, 1992.

This emergency order extends the commercial salmon fishing period until 10:00 P.M. Saturday, July 25, 1992 in Orzinski Bay: all waters in Orzinski Bay north of a line from Elephant Point (55°41'55" N.lat., 160°03'12" W.long.) to Waterfall Point (55°43'13" N.lat., 160°01'05" W.long.).

JUSTIFICATION: The Southeastern District Mainland fishery, except for Orzinski Bay and the Stepovak Flats Section, is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360.

The escapement through the Orzinski Lake weir, as of 12:00 P.M., midnight, July 20 was 16,497 sockeye salmon. During July 6-20 Orzinski Bay has been open to continuous salmon fishing and the closed waters has been reduced to the stream terminus at the ocean shoreline. Daily escapement through the weir has averaged 501 sockeye salmon over the past week (July 14-20). The July 23 escapement goal of 15,000 salmon has been exceeded by 1,497 salmon. Continuous salmon fishing through July 25 is needed to harvest salmon that are excess to escapement requirements.

=====

EMERGENCY ORDER NO. 4-F-M-SP-32-92

EFFECTIVE DATE: 10:00 P.M. July 25, 1992

EXPLANATION: This emergency order extends the time period of the reduced closed waters at Orzinski River to the stream terminus at the ocean shoreline until 9:00 P.M. Wednesday, July 29, 1992.

-Continued-

This emergency order extends the commercial salmon fishing period until 9:00 P.M. Wednesday, July 29, 1992 in Orzinski Bay: all waters in Orzinski Bay north of a line from Elephant Point (55°41'55" N.lat., 160°03'12" W.long.) to Waterfall Point (55°43'13" N.lat., 160°01'05" W.long.).

JUSTIFICATION: The Southeastern District Mainland fishery, except for Orzinski Bay and the Stepovak Flats Section, is managed on the basis of Chignik sockeye salmon prior to July 26 as described under 5 AAC 09.360, after July 25 the entire district is managed on local stocks.

The escapement through the Orzinski Lake weir, as of 12:00 P.M., midnight, July 24 was 18,869 sockeye salmon. During July 6-25 Orzinski Bay has been open to continuous salmon fishing and the closed waters has been reduced to the stream terminus at the ocean shoreline. Daily escapement through the weir has averaged 605 sockeye salmon over the past week (July 18-24). The July 23 escapement goal of 15,000 salmon has been exceeded by 3,869 salmon. It is anticipated that the August 7 escapement goal of 20,000 sockeye salmon should be achieved with continuous fishing effort through July 29. Continuous salmon fishing through July 29 is needed to harvest salmon that are excess to escapement requirements.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-27-92

EFFECTIVE DATE: 10:00 A.M. July 27, 1992

EXPLANATION: This emergency order establishes a 10:00 A.M. July 27 until 9:00 P.M. July 29 commercial salmon fishing period in the following locations:

- | | |
|---------------------------|-------------------------|
| 1. Southeastern District | 4. Sanak Island Section |
| 2. South Central District | 5. Otter Cove Section |
| 3. Southwestern District | 6. Bechevin Bay Section |

Due to the presence of immature salmon which gill in seines, seining will not be allowed in the Shumagin Islands Section, that portion of the Southwestern District located within one nautical mile of Poperechnoi Island, and that portion of the Sanak Island section located outside of a 4 nautical mile radius of Chicago Point.

JUSTIFICATION: Pink salmon escapements in early systems are good for this date and catches indicate the South Peninsula pink salmon run is strong. The chum salmon escapement into St. Catherine Cove is good and Bechevin Bay pink salmon runs should be getting underway. The Southeastern District Mainland is now being managed on the basis of local stocks. Fishing time is needed to harvest the resource.

Large numbers of immature salmon are present in the Shumagin Islands. These fish gill in seines and are a major wasted resource if seine gear is allowed to operate when immature salmon are present in large numbers. Substantial numbers of immature salmon were also reported from Poperechnoi Island during the July 18 - 19 fishing period. In the past, large numbers of immature salmon have been taken by seiners in the Sanak Island Section. The closure of the Shumagins to seining could cause a large movement of seiners to capes along Sanak Island which could cause a large resource loss in an area too remote to monitor. Allowing seiners to fish within four nautical miles of Chicago Point will give them the opportunity to harvest pinks in an area where immature salmon are likely absent.

-Continued-

EMERGENCY ORDER NO. 4-FS-M-CB-28-92

EFFECTIVE DATE: 12:00 Noon, July 27, 1992

EXPLANATION: This emergency order establishes a 12:00 Noon July 27 until 9:00 P.M. July 31 commercial salmon fishing period in the Aleutian Islands Area.

JUSTIFICATION: To date no salmon fishing has taken place in the Aleutian Islands Area. There are only one or two salmon fishing boats located at Unalaska. Fishing time is needed so that run strength can be tested in an area of substantial size.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-29-92

EFFECTIVE DATE: 12:01 A.M. July 28, 1992

EXPLANATION: This emergency order reopens seining for salmon in those portions of the South Peninsula closed to seining due to the presence of immature salmon.

JUSTIFICATION: Test fish results during July 27 indicate that the number of immature salmon caught per set is at an acceptable level (less than 100). The trend during the last three days has been fewer immature salmon each day. The number of immature salmon should be even lower on July 28 when seining is reopened in those South Peninsula locations presently closed to seining.

=====

EMERGENCY ORDER NO. 4-F-M-SP-33-92

EFFECTIVE DATE: 2:30 P.M. July 28, 1992

EXPLANATION: This emergency order closes the Shumagin Islands Section to seining effective 2:30 P.M. Tuesday, July 28 until the end of the present fishing period, which ends 9:00 P.M. Wednesday, July 29, 1992.

JUSTIFICATION: Observations by the Alaska Department of Fish and Game during the late morning and early afternoon of July 28 indicated that purse seine gear were gilling between 111 and 277 immature salmon per set in the Shumagin Islands Section. This is a waste of a valuable resource. To prevent further waste, the Shumagin Islands Section seine fishery should be closed at this time.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-30-92

EFFECTIVE DATE: 12:01 A.M. July 29, 1992

EXPLANATION: This emergency order allows commercial salmon fishing up to the stream terminus at the ocean shoreline of the following streams during open fishing periods during July 29 through August 31.

1. Eastern Creek on Deer Island
2. Southern Creek on Deer Island
3. Settlement Point Creek at Pavlof Bay
4. Middle Creek (also known as Priest Creek) at Pavlof Bay

-Continued-

JUSTIFICATION: The peak escapement goal range of pink salmon has been reached in Eastern, Southern, Settlement Point, and Middle Creeks. The escapements are unusually high for this date. More fishing time is needed to harvest the resource.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-31-92

EFFECTIVE DATE: 3:00 P.M. July 29, 1992

EXPLANATION: This emergency order supersedes emergency order No. 4-FS-M-SP-33-92. Seining is again allowed in the Shumagin Islands Section effective 3:00 P.M. July 29.

The commercial salmon fishing period in the Southeastern District, South Central District, Southwestern District, Sanak Island Section and Otter Cove Section is extended 48 hours until 9:00 P.M. July 31.

JUSTIFICATION: Test fishing results indicate that the number of immature salmon caught per set is 64. Catches under 100 per set is considered acceptable, therefore fishing with seine gear can again be allowed in the Shumagin Islands.

Pink salmon escapements are generally very good for this date throughout the South Peninsula. More fishing time can be allowed at this time without jeopardizing the resource.

=====

EMERGENCY ORDER NO. 4-F-M-SP-34-92

EFFECTIVE DATE: 9:00 P.M. July 29, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period until 10:00 A.M. Saturday, August 1, 1992 in Orzinski Bay: all waters in Orzinski Bay north of a line from Elephant Point (55°41'55" N.lat., 160°03'12" W.long.) to Waterfall Point (55°43'13" N.lat., 160°01'05" W.long.).

JUSTIFICATION: After July 25 the entire Southeastern District Mainland fishery as described under 5 AAC 09.360, is managed on local stocks.

The escapement through the Orzinski Lake weir, as of 12:00 P.M., midnight, July 27 was 19,737 sockeye salmon. During July 6-28 Orzinski Bay has been open to continuous salmon fishing and the closed waters has been reduced to the stream terminus at the ocean shoreline. Daily escapement through the weir has averaged 463 sockeye salmon over the past week (July 21-27). It is anticipated that the August 7 escapement goal of 20,000 sockeye salmon should be achieved with continuous fishing effort through August 1. Continuous salmon fishing through August 1 is needed to harvest salmon that are excess to escapement requirements.

Closed waters at Orzinski River will be expanded from the current stream terminus at the ocean shoreline to the normal 1,000 yard closure from the stream mouth effective 9:00 P.M. Wednesday, July 29.

-Continued-

EMERGENCY ORDER NO. 4-FS-M-CB-32-92

EFFECTIVE DATE: 12:00 P.M. Midnight, July 30, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time in the Nelson Lagoon Section 24 hours until 12:00 P.M. Friday during the week of July 26 - August 1.

JUSTIFICATION: Sockeye catches in Nelson Lagoon are averaging 4,000 fish per day which indicates a strong late run. During previous years when catches were at this level, escapements were good in the late systems when at least 5 days per week fishing time was allowed. One more day of fishing can be allowed without jeopardizing the resource.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-33-92

EFFECTIVE DATE: 12:00 P.M. Midnight, July 31, 1992

EXPLANATION: This emergency order extends the present commercial salmon fishing period 48 hours until 9:00 P.M. August 2 in that portion of the South Peninsula located east of the longitude of Rock Island.

Effective August 1, the closed waters are reduced to the terminus at the ocean shoreline of all streams on Deer Island. The closed waters at Thin Point Cove are reduced to include only those waters within 1,000 yards of the Thin Point Lagoon terminus and 500 yards of the other salmon stream entering Thin Point Cove.

JUSTIFICATION: Escapements of pink salmon are generally good for this date along the South Peninsula. Purse seiners in the Shumagin Islands are averaging about 4,000 pink salmon per day which indicates a strong run. More fishing time is needed to harvest the resource.

The peak escapement goal range of pink salmon has been reached in all Deer Island salmon streams.

The Thin Point Lagoon sockeye escapement is estimated at 18,000 which is in the goal range. More fishing time is needed to harvest the resource. A 1,000 yard closure outside the lagoon entrance is needed to prevent the fish in the lagoon from backing out into the fishery at low tide.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-34-92

EFFECTIVE DATE: 9:00 P.M. August 2, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time until 9:00 P.M. Thursday August 6 in the South Central District, Deer Island Section, and Thin Point Section.

The closed waters are reduced to include only those waters upstream from the terminus at the ocean shoreline of all streams in the Mino Creek - Little Coal Bay Section located between Seal Cape and Cape Tolstoi.

-Continued-

JUSTIFICATION: Pink and chum salmon escapement requirements have been made in Deer Island and most early South Central District systems. The sockeye escapement requirements have been met in the Thin Point Section and pink salmon escapements are good for this date.

Pink salmon escapement requirements have been met in Coal Bay streams. More fishing area and time is needed to harvest the resource.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-35-92

EFFECTIVE DATE: 10:00 A.M. August 3, 1992

EXPLANATION: This emergency order establishes a 10:00 A.M. August 3 until 9:00 P.M. August 7 commercial salmon fishing period in the Aleutian Islands Area.

JUSTIFICATION: Effort in the Aleutian Islands Area consists of only one or two boats and markets are very limited. The previous week's catch indicates there is a substantial pink salmon run. More fishing time can be allowed with such light effort and processing capacity without jeopardizing the resource.

=====

EMERGENCY ORDER NO. 4-F-M-SP-35-92

EFFECTIVE DATE: 10:00 A.M. August 4, 1992

EXPLANATION: This emergency order opens the Northwest side of Unga Island in the Shumagin Islands Section between Unga Spit (55°24'40" N.lat., 160°43'39" W.long.) and Pinnacle Point (55°16'30" N.lat., 160°51'30" W.long.) to commercial salmon fishing from 10:00 A.M. Tuesday, August 4 until 9:00 P.M. Thursday, August 6, 1992.

Commercial salmon fishing will be allowed up to the lagoon terminus at the ocean shoreline of Bay Point and Dry lagoon effective 10:00 A.M., Tuesday, August 4, 1992.

The balance of the Southeastern District will open to commercial salmon fishing at 10:00 A.M. Wednesday, August 5 until 9:00 P.M. Thursday August 6. In addition the following locations will also open to commercial salmon fishing from 10:00 A.M. Wednesday August 5 until 9:00 P.M. Thursday August 6:

1. Southwestern District
2. Unimak District
3. Bechevin Bay Section

JUSTIFICATION: Pink salmon escapements are generally very good for this date throughout the South Peninsula. More fishing time can be allowed at this time without jeopardizing the resource.

Closed waters at Bay Point and Dry Lagoon will be reduced to the lagoon terminus at the ocean shoreline to harvest pink salmon in excess of these streams annual escapement goals.

-Continued-

EMERGENCY ORDER NO. 4-FS-M-PM-14-92

EFFECTIVE DATE: 10:00 A.M. August 5, 1992

EXPLANATION: This emergency order reopens the commercial salmon fishing period in that portion of Herendeen Bay from 10:00 a.m. Wednesday, August 5 until 12:00 p.m. September 30 or until further notice. The closed waters of Herendeen Bay include: 1) all waters southeast of a line from 55° 43' 33" N. lat., 160° 42' 24" W. long. to a point 1/2 nautical mile northwest of Lawrence Valley Creek at 55° 44' 52" N. lat., 160° 40' 01" W. long., 2) all waters of the Deer Valley (west arm) arm of Herendeen Bay south of 55° 45' 15" N. lat., 3) all waters within one nautical mile of Coal Creek, and 4) all waters within 500 yards of the stream terminus at the ocean shoreline of the stream flowing into Mine Harbor.

JUSTIFICATION: The first significant run of pink salmon into Herendeen Bay occurred in 1990 when over 500,000 were harvested and the escapement into Lawrence Valley Creek was over 100,000. Lawrence Valley Creek pink salmon escapement as of August 1 was 70,000. The catches in North Peninsula waters indicate more pink salmon are en route. The closed waters around the major chum salmon producing systems will provide adequate protection for the remaining run of chum salmon while allowing a fishery for pink salmon. Continuous fishing time is necessary to harvest the anticipated large run of pink salmon into Lawrence Valley Creek.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-36-92

EFFECTIVE DATE: 6:00 P.M. August 6, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 6:00 P.M. Friday in the Izembek - Moffet Bay Section during the week of August 2 - 8.

JUSTIFICATION: The Izembek - Moffet Bay fishing effort consists of only 4 seiners who were not able to fish on Wednesday and likely will not fish Thursday due to high winds. Chum catches during Monday and Tuesday totaled 12,500- fish which indicates a strong late run. A 24 hour extension will enable fishermen to harvest at least some of the fish they would have taken during periods of high winds.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-37-92

EFFECTIVE DATE: 9:00 P.M. August 6, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 48 hours until 9:00 P.M. August 8 in the Bechevin Bay Section and all four South Peninsula Districts.

JUSTIFICATION: The South Peninsula pink salmon runs are strong and escapements are generally very good for this date. High winds have prevented fishing in much of the area during August 5 and the condition remains the same during August 6. More fishing time is needed to harvest the resource.

-Continued-

EMERGENCY ORDER NO. 4-FS-M-CB-38-92

EFFECTIVE DATE: 9:00 P.M. August 7, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 96 hours until 9:00 P.M. August 11 in the Aleutian Islands Area.

JUSTIFICATION: Since the present fishing period opened on August 3, there has been no commercial salmon fishing in the Aleutian Islands Area due to a lack of markets. An extension of the fishing period will provide the opportunity to harvest pink salmon in the Aleutians and test run strength when and if a market is available.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-39-92

EFFECTIVE DATE: 12:01 A.M. August 8, 1992

EXPLANATION: This emergency order reduces the waters closed to commercial salmon fishing to include only those waters upstream from the terminus at the ocean shoreline of all streams emptying into Dolgoi Harbor.

JUSTIFICATION: The estimated pink salmon escapement into Dolgoi Harbor Creek is 4,500 which is in the peak escapement goal range. Approximately 10,000 pink salmon are at the stream mouth. More fishing time is needed to harvest the resource.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-40-92

EFFECTIVE DATE: 9:00 P.M. August 8, 1992

EXPLANATION: This emergency order extends commercial fishing time 72 hours until 9:00 P.M. August 11, in the following locations:

1. The northwest side of Unga Island between Pinnacle Point and Unga Spit
2. Pavlof Bay Section
3. Thin Point Section
4. Deer Island Section
5. All waters of Dolgoi Harbor

The Bechevin Bay Section, Unimak District, and those portions of the Southwestern and South Central Districts not included above, are reopened to commercial salmon fishing during 10:00 A.M. August 10 until 9:00 P.M. Tuesday August 11.

JUSTIFICATION: Catches of pink and chum salmon in most of the western South Peninsula indicates strong runs but that most fish are in deep water where they are being harvested. A brief closure will allow some more fish to get to the beach and into closed waters. The pink salmon catch per unit effort on the capes or in the Shumagin Islands was poor and no more fishing should be allowed until escapements can be assessed, with exception of the area between Unga Spit and Pinnacle Point where escapement goals have been surpassed. Escapement goals of pink salmon have been reached in Pavlof Bay and Deer Island Section streams as well as in Dolgoi Harbor. The sockeye escapement goal range has been reached at Thin Point Cove and pink salmon escapements are good for this date in the balance of the streams.

-Continued-

EMERGENCY ORDER NO. 4-FS-M-CB-41-92

EFFECTIVE DATE: 12:01 A.M. August 10, 1992

EXPLANATION: This emergency order reduces the closed waters in Little Bear Bay to include only those waters of the inner bay and the waters of Kitchen Anchorage to include only those waters within 500 yards of the creek.

JUSTIFICATION: There are 5,000 pinks off the mouth of Kitchen Anchorage Creek plus 15 - 20,000 along the beaches, plus numerous jumpers in deep water. This is far more salmon than the creek can handle. With such abundance, there is no need for such a large closure as presently in effect. Numerous jumpers have been seen in the inner portion of Bear Bay and there is very limited spawning capacity of the stream. There is no need for outer Bear Bay to be closed when pink runs are strong and the inner bay provides a large sanctuary.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-15-92

EFFECTIVE DATE: 6:00 A.M. August 10, 1992

EXPLANATION: This emergency order reduces the closed waters at Bear River to the stream terminus at the ocean shoreline from 6:00 a.m. Monday, August 10 until 6:00 p.m. Thursday, August 13.

JUSTIFICATION: The overall season escapement goal for Bear River is 200,000 - 250,000 sockeye by August 31. The present escapement as of 7:45 p.m. August 9 is 282,016 sockeye. The post-August 5 escapement goal for Bear River is 50,000 - 75,000 sockeye salmon. As of 7:45 p.m. August 9, the escapement through the weir for the post-August 5 period is 22,134 sockeye and averaging over 7,200 sockeye/day for the previous three days. The post August 5 escapement goal of 50,000 - 75,000 will be exceeded at the present escapement rate. Opening the stream terminus to the ocean shoreline of the Bear River will more effectively control the escapement. It is appropriate to open the Bear River to the stream terminus to the ocean shoreline to provide the optimum opportunity to harvest sockeye salmon surplus to the escapement needs while preventing over-escapement.

=====

EMERGENCY ORDER NO. 4-F-M-SP-36-92

EFFECTIVE DATE: 10:00 A.M. August 11, 1992

EXPLANATION: This emergency order opens the following locations to commercial salmon fishing from 10:00 A.M. Tuesday, August 11 until 9:00 P.M. Wednesday August 12, 1992:

1. Balboa Bay Section
2. East Stepovak Section
3. Shumagin Islands Section

JUSTIFICATION: Pink salmon escapements are generally good for this date throughout the Southeastern District. Aerial surveys today indicated that more fishing time can be allowed in the Balboa Bay, East Stepovak, and Shumagin Islands without jeopardizing the resource.

-Continued-

EMERGENCY ORDER NO. 4-FS-M-CB-42-92

EFFECTIVE DATE: 9:00 P.M. August 11, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 9:00 P.M. August 12, in the following locations:

1. Canoe Bay Section
2. That portion of the Pavlof Bay Section located north of the latitude of Black Point
3. All waters of Dolgoi Harbor
4. Belkofski Bay Section
5. Deer Island Section

Commercial salmon fishing is extended 48 hours until 9:00 P.M. August 13 in the following locations:

1. Makushin Bay Section
2. Kashega Bay Section

JUSTIFICATION: Pink and chum salmon escapements are generally good for this date in the upper Pavlof Bay - Canoe Bay Area, Dolgoi Harbor, Belkofski Bay, and Deer Island. More fishing time is needed to harvest the resource.

Pink salmon escapements are good for this date in Kashega Bay streams and large numbers of pinks are in closed waters of Makushin Bay. Only three boats are fishing Makushin Bay and are catching large numbers of pinks. No boats are presently fishing in the Kashega Bay Section. More fishing time can be allowed at this time without jeopardizing the resource.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-16-92

EFFECTIVE DATE: 6:00 P.M. August 12, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Bear River and Three Hills Sections from 6:00 p.m. Thursday, August 13 until 6:00 a.m. Monday, August 17, and reduces the closed waters at Bear River to the stream terminus at the ocean shoreline. That portion of the Herendeen-Moller Bay Section enclosed by a line from Entrance Point to Harbor Point is extended from 6:00 p.m. Thursday, August 13 until 6:00 a.m. Monday, August 17. The Ilnik Section is extended from 6:00 p.m. Wednesday, August 12 until 6:00 a.m. Monday, August 17.

JUSTIFICATION: The post-August 5 escapement goal of 50,000-75,000 sockeye for Bear River has been met as of 7:45 p.m. August 11. The escapement for the post - August 5 period is presently 52,000 bringing the total season escapement to 312,000 sockeye. The season goal for Bear River is 200,000 - 250,000 sockeye. The upper goal for the post-August 5 period may be substantially exceeded if more fishing time is not allowed. The stream terminus at the ocean shoreline of the Bear River will remain open to more effectively control the escapement. The daily commercial harvest rate indicates more fish are en route, and it is appropriate to extend these areas and provide the optimum opportunity to harvest sockeye salmon surplus to the escapement needs while preventing over-escapement.

-Continued-

EMERGENCY ORDER NO. 4-FS-M-CB-43-92

EFFECTIVE DATE: 9:00 P.M. August 12, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 9:00 P.M. August 13, in the following locations:

1. Deer Island Section
2. That portion of the Pavlof Bay Section north of the latitude of Black Point
3. Canoe Bay Section
4. Balboa Bay Section
5. Shumagin Islands Section
6. East Stepovak Section

JUSTIFICATION: The pink and chum salmon runs are strong in the Shumagin Islands, Balboa Bay, East Stepovak, Canoe Bay, upper Pavlof Bay, and at Deer Island. Weather is preventing fishing in some of the above locations. More fishing time can be allowed at this time in the above locations without jeopardizing escapements. Other locations are not being extended at this time due to a need to survey the areas or in some cases, where runs are not strong but effort is intense, a closure is needed to enable more fish to get into closed waters.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-44-92

EFFECTIVE DATE: 9:00 P.M. August 13, 1992

EXPLANATION: This emergency order expands the waters closed to commercial salmon fishing at Makushin Bay to include all of Humpback Bay (a bay within Makushin Bay). Commercial salmon fishing time in the Makushin Bay and Kashega Bay Sections is extended 48 hours until 9:00 P.M. August 15.

JUSTIFICATION: The commercial salmon fishing effort in the Makushin and Kashega Bay Sections is light, consisting of only three boats. Catches are very strong averaging 30,000 fish per boat which indicates strong runs. The escapement into the major stream in Humpback Bay is only 30,000 compared to a target of approximately 100,000 for this date. More fishing time can be allowed to harvest the resource if Humpback Bay is closed and the balance of the Makushin and Kashega Bay Sections remain open.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-45-92

EFFECTIVE DATE: 9:00 P.M. August 13, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 9:00 P.M. August 14 in the Shumagin Islands and Deer Island Sections. A 10:00 A.M. until 9:00 P.M. fishing period is established during August 14 in the Bechevin Bay Section, South Central District and all of the Southwestern District except the Morzhovoi Bay Section and Thin Point Cove.

-Continued-

JUSTIFICATION: South Peninsula pink salmon runs are strong in general. Catches in the Shumagin Islands indicate that a substantial number of fish are still coming in. Escapement requirements have been met at Deer Island and catches continue to be strong. Escapements and catches have been generally good over much of the area. An extension in the Shumagins and at Deer Island will be a good indicator of the number of pinks coming into the area and is needed to harvest Deer Island pinks. A short opening for other locations is needed to harvest fish before they become unmarketable. Further extensions will be made if August 13 surveys indicate they are warranted.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-46-92

EFFECTIVE DATE: 9:00 P.M. August 14, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 48 hours until 9:00 P.M. August 16 in the Shumagin Islands Section, Bechevin Bay Section, South Central District, and all of the Southwestern District except the Morzhovoi Bay Section and Thin Point Cove.

Effective 9:00 P.M. August 14, the closed waters are expanded as follows in the following Shumagin Islands locations to include:

1. all waters of Squaw Harbor (Baralof Bay) west of the longitude of the east end of the Peter Pan Seafoods dock.
2. all waters of Delarof Harbor west of 160°30' W. long.
3. all waters of the Fox Hole (Little Harbor) west of 160°19'45" W. long.
4. all waters within 1,000 yards of the terminus of the stream on Unga Island locally known as the Farm or Ben Green Bight.

JUSTIFICATION: Pink salmon escapements are generally good in the Southwestern and South Central Districts and at the Shumagin Islands Section. The escapement of chum salmon at Traders Cove in Bechevin Bay is good for this date. More fishing time is needed to harvest the resource.

Expanded closures are needed in four Shumagin Island streams to insure that escapements will be met while allowing fishermen to harvest fresh fish coming into the area.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-47-92

EFFECTIVE DATE: 9:00 P.M. August 15, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 9:00 P.M. August 16 in the Makushin Bay and Kashega Bay Sections.

JUSTIFICATION: Commercial salmon fishing effort consists of only two boats and catches of pink salmon indicate large numbers of fish are still moving into the area. More fishing time can be granted to harvest the resource at this time with such light effort.

-Continued-

EMERGENCY ORDER NO. 4-FS-M-CB-48-92

EFFECTIVE DATE: 9:00 P.M. August 16, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 9:00 P.M. August 17 in the Shumagin Islands Section. Commercial salmon fishing time is extended 48 hours until 9:00 P.M. August 18 in the Bechevin Bay Section, South Central District, and all of the Southwestern District except the Morzhovoi Bay Section and Thin Point Cove.

Effective 9:00 P.M. August 19 Lenard Harbor is closed waters to commercial salmon fishing.

JUSTIFICATION: Pink salmon escapements are generally good in the Shumagin Islands, the South Central District and much of the Southwestern District. Late chum salmon escapements are good for this date in the Bechevin Bay Section. Pink salmon runs are unusually strong in most of the Southwestern and South Central Districts. Thin Point Cove should remain closed at this time to ensure that a good sockeye escapement is obtained and enough fish are available for subsistence purposes.

There is no buildup of chum salmon on the flats at the head of Lenard Harbor and the escapement into the main stream is weak, consisting of less than 3,000 chums and 2,000 pinks. Lenard Harbor should be closed to commercial salmon fishing until the escapement improves substantially.

=====

EMERGENCY ORDER NO. 4-F-M-SP-37-92

EFFECTIVE DATE: 9:00 P.M. August 17, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 9:00 P.M. Tuesday, August 18, 1992 in the Shumagin Islands Section.

JUSTIFICATION: Pink salmon escapements are generally good for this date in the Shumagin Islands Section. Aerial surveys on Saturday, August 15 indicated that more fishing time can be allowed in the Shumagin Islands Section to harvest pink salmon in excess to escapement requirements. Windy weather on August 16 prevented much of the fleet from fishing effectively.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-49-92

EFFECTIVE DATE: 9:00 P.M. August 18, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 9:00 P.M. August 19 in the Shumagin Islands Section. Commercial salmon fishing time is extended 48 hours until 9:00 P.M. August 20 in the Mino Creek - Little Coal Bay Section, that portion of the Pavlof Bay Section located east of 163°32' W. long., Dolgoi Harbor, Belkofski Bay Section, Deer Island Section, Ikatani Bay Section, and Thin Point Section. Thin Point Cove is reopened from 9:00 P.M. August 18 until 9:00 P.M. August 20.

-Continued-

The closed waters are reduced to include only those waters upstream from the terminus at the ocean shoreline of all streams located along the north shore of Ikatan Bay between Kenmore Head and the Palisade Cliffs.

JUSTIFICATION: Pink salmon escapements are generally good in those locations where fishing time is extended. Fresh pink salmon are still moving into the area and fishing effort has dropped substantially due to the upcoming halibut fishery west of Cape Lutke. A large number of sockeye have moved into Thin Point Lagoon during the past week and more fishing time can be allowed to harvest incoming fish.

Pink salmon escapement goals have been reached in all streams between Kenmore Head and Palisade Cliffs. More fishing area is needed to harvest the resource.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-50-92

EFFECTIVE DATE: 6:00 P.M. August 19, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 6:00 P.M. Thursday during the week of August 16 - 22 in the Inner Port Heiden Section.

JUSTIFICATION: Inner Port Heiden coho catches averaged 144 fish per delivery during August 18 which is good for this date. Winds as high as 80 m.p.h. are preventing any fishing today. An additional 24 hours of fishing time will enable fishermen to make up for time lost to weather during a strong coho run with a normal amount of gear for this date.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-18-92

EFFECTIVE DATE: 6:00 P.M. August 19, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Ilnik Section, from 6:00 p.m. Wednesday, August 19 until 6:00 p.m. Thursday, August 20, 1992.

JUSTIFICATION: Weather conditions in the Ilnik Section have hindered a significant portion of the effort in the section. Although still early in the season, coho salmon catches are similar to date as in 1991, which had good escapement into the Ilnik system. Significant area closures, as described in the regulation book, will provide additional protection to coho salmon stocks. It is appropriate at this time to extend the Ilnik Section 24 hours to allow appropriate fishing opportunity.

=====

EMERGENCY ORDER NO. 4-F-M-SP-38-92

EFFECTIVE DATE: 9:00 P.M. August 19, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 9:00 P.M. Thursday, August 20, 1992 in the Shumagin Islands Section.

-Continued-

JUSTIFICATION: Pink salmon escapements are generally good for this date in the Shumagin Islands Section. Pink salmon runs are unusually strong in the Shumagin Islands Section. Fishing time is also needed to harvest coho salmon which are entering local waters at this time. Windy weather has prevented much of the fleet from fishing effectively and effort is decreasing daily.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-17-92

EFFECTIVE DATE: 6:00 P.M. August 20, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Bear River and Three Hills Sections from 6:00 p.m. Thursday, August 20 until 6:00 a.m. Monday, August 24, and reduces the closed waters at Bear River to the stream terminus at the ocean shoreline. That portion of the Herendeen-Moller Bay Section enclosed by a line from Entrance Point to Harbor Point is extended from 6:00 p.m. Thursday, August 20 until 6:00 a.m. Monday, August 24.

JUSTIFICATION: The total season escapement through the Bear River weir as of August 18 was 377,714 sockeye. The season escapement goal of 200,000 - 250,000 has been exceeded. The post-August 5 escapement goal of 50,000 - 75,000 has also been exceeded (117,832). The daily escapement since August 13 averaged over 10,000 sockeye/day, with the peak season daily escapement of 20,238 sockeye occurring on August 15. The stream terminus at the ocean shoreline of the Bear River will remain open to more effectively control the escapement. The daily commercial harvest rate indicating more fish are en route, it is appropriate to extend these areas and provide the optimum opportunity to harvest sockeye salmon surplus to the escapement needs.

=====

EMERGENCY ORDER NO. 4-F-M-SP-39-92

EFFECTIVE DATE: 9:00 P.M. August 20, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 9:00 P.M. Friday, August 21, 1992 in the Shumagin Islands Section.

JUSTIFICATION: An aerial survey this afternoon indicated that pink salmon runs and escapements are unusually strong in the Shumagin Islands Section for most streams. Fishing time is also needed to harvest coho salmon which are entering local waters at this time. Windy weather has prevented much of the fleet from fishing effectively and effort is decreasing daily.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-51-92

EFFECTIVE DATE: 12:00 P.M. Midnight, August 20, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 6 hours until 12:00 P.M. Midnight Thursday during the week of August 16 - 22 in the Inner Port Heiden Section.

JUSTIFICATION: Inner Port Heiden coho salmon catches averaged 144 fish per delivery during August 18 which is good for this date. High winds prevented any fishing during August 19, consequently the fishing period was extended 24 hours

-Continued-

until 6:00 P.M. August 20. However high winds continued until the morning of August 20. As a result, fishermen were unable to fish the August 19 evening tide. An extension until 12:00 P.M. August 20 will enable fishermen to make up the full fishing day lost to weather.

=====

EMERGENCY ORDER NO. 4-F-M-SP-40-92

EFFECTIVE DATE: 9:00 P.M. August 21, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 9:00 P.M. Saturday, August 22, 1992 in the Shumagin Islands Section.

JUSTIFICATION: Pink salmon runs are unusually strong in the Shumagin Islands Section for most streams. Fishing time is also needed to harvest coho salmon which are entering local waters at this time. Windy weather has prevented much of the fleet from fishing effectively and effort is low.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-52-92

EFFECTIVE DATE: 6:00 P.M. August 26, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 6:00 P.M. Thursday during the week of August 23 - 29 in the Inner Port Heiden Section.

JUSTIFICATION: The Inner Port Heiden coho harvest totaled 4,100 fish during August 24, this is nearly twice as many fish as were caught during approximately the same date during the previous three years. The gear level is approximately the same as during previous years. Good escapements have been achieved in the past while allowing four days of fishing in the Inner Port Heiden Section during strong runs with the present gear level. An extra day of fishing can be granted at this time without jeopardizing the resource.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-19-92

EFFECTIVE DATE: 6:00 P.M. August 26, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in that portion of the Ilnik Section located within four (4) nautical miles of the stream terminus of Unangashak River from 6:00 p.m. Wednesday, August 26 until 12:00 p.m. (midnight) Wednesday, August 26. The remaining portion of the Ilnik Section is extended from 6:00 p.m. Wednesday, August 26 until 6:00 p.m. Friday, August 28. The Bear River and Three Hills Sections are extended from 6:00 p.m. Thursday, August 27 for the duration of the 1992 commercial salmon season, and reduces the closed waters at Bear River to the stream terminus at the ocean shoreline. That portion of the Herendeen-Moller Bay Section enclosed by a line from Entrance Point to Harbor Point is also extended from 6:00 p.m. Thursday, August 27 for the duration of the 1992 commercial salmon season.

JUSTIFICATION: Effort in the Ilnik Section consists of a few set gill net operators fishing mainly near the Unangashak River. Survey conditions have been poor in the Ilnik and Unangashak Rivers, but catch data indicates a strong early

-Continued-

run comparable to past years. Closing the area around the Unangashak River will redistribute effort throughout the entire Ilnik system.

The total season and all interim escapement goals for Bear River have been met. The season escapement goal for Bear River is 200,000 - 250,000 sockeye salmon. As of August 25, the sockeye escapement into Bear River is 397,810. The stream terminus at the ocean shoreline of the Bear River, which has been open since July 4, will remain open to more effectively control the escapement. The daily commercial harvest rate indicates more fish are en route, and it is appropriate to extend these areas and provide the optimum opportunity to harvest surplus sockeye salmon.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-53-92

EFFECTIVE DATE: 12:00 P.M. Midnight, August 26, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 12:00 P.M. Midnight Thursday during the week of August 23 - 29 in the Nelson Lagoon Section.

JUSTIFICATION: The estimated coho escapement into the Sapsuk River is 6,000 fish which is good for this date. The Nelson Lagoon coho catch during August 24 and 25 was 9,000 and 5,500 fish respectively which indicates a strong run. During the previous two years with what appears were weaker runs, the Sapsuk River escapement goal of 20,000 to 30,000 coho was exceeded. An extra 24 hours of fishing time can be granted at this time without jeopardizing the resource.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-20-92

EFFECTIVE DATE: 6:00 P.M. August 28, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period from 6:00 p.m. Friday, August 28 until 12:00 p.m. (midnight) Saturday, August 29 in the remaining portion of the Ilnik Section not located within four (4) nautical miles of the stream terminus of Unangashak River.

JUSTIFICATION: Effort in the Ilnik Section consists of a few set gill net operators that have been fishing mainly near the Unangashak River. Survey conditions have been poor to monitor the Unangashak River coho escapement. Weather conditions over the past 24 hours have hindered fishing opportunity in the Ilnik Section. Keeping the area around the Unangashak River closed to commercial salmon fishing will redistribute effort throughout the entire Ilnik system and target on other local coho stocks. It is appropriate at this time to extend the Ilnik Section, except that area around the Unangashak River.

=====

EMERGENCY ORDER NO. 4-F-M-SP-41-92

EFFECTIVE DATE: 9:00 A.M. September 1, 1992

EXPLANATION: This emergency order allows a 9:00 A.M. Tuesday, September 1 until 9:00 P.M. Thursday, September 3 salmon fishing period in the Southeastern District.

-Continued-

Closed waters are expanded to include all waters as follows:

- A. Zachary Bay: all waters in Zachary Bay South of 55⁰21' N. lat.
- B. All waters within 1,000 yards of the terminus of the stream on Unga Island locally known as the Farm or Ben Green Bight will be closed to commercial salmon fishing.
- C. Squaw Harbor (Baralof Bay): all waters in Squaw Harbor West of the longitude of the East end of the Peter Pan Seafoods dock.
- D. Delarof Harbor: all waters in Delarof Harbor West of 160⁰30' W. long.
- E. Archeredin Bay: all waters in Archeredin Bay North of 55⁰10' N. lat.
- F. Fox Hole (Little Harbor): all waters in Fox Hole West of 160⁰19'45" W. long.
- G. Dorenoi Bay: all waters in Dorenoi Bay West of a line extending from the North shore of Dorenoi Bay at 55⁰39'12" N. lat., 160⁰23'06" W. long. to a point on the South shore of Dorenoi Bay at 55⁰37'54" N. lat., 160⁰24'36" W. long.
- H. Chichagof Bay: all waters in Chichagof Bay North of a line extending from the Eastern shore of Chichagof Bay at 55⁰39'36" N. lat., 160⁰13'30" W. long. to a point on the Western shore of Chichagof Bay at 55⁰38'56" N. lat., 160⁰15' W. long.
- I. Orzinski Bay: all waters of Orzinski Bay within 1,000 yards of any salmon stream.
- J. Clark Bay: all waters of Clark Bay North of a line extending from the Eastern shore of Clark Bay at 55⁰47' N. lat., 160⁰58'45" W. long. to a point on the Western shore of Clark Bay at 55⁰45'33" N. lat., 160⁰02'55" W. long.
- K. Grub Gulch: all waters of Grub Gulch North of 55⁰48' N. lat.
- L. Island Bay: all waters of Island Bay East of 159⁰38'12" W. long.
- M. Fox Bay: (1) all waters of the Northeast Head of Fox Bay East of 159⁰37'18" W. long.
(2) all waters of the Southeast Head of Fox Bay East of a line extending from the North shore of the Southeast Head of Fox Bay at 55⁰37'07" N. lat., 159⁰38'12" W. long. to a point on the South shore of the Southeast Head of Fox Bay at 55⁰36'48" N. lat., 159⁰38'30" W. long.
- N. Boulder Bay: all waters of Boulder Bay East of 159⁰43' W. long.

All other closed waters are as listed in 5 AAC 09.350 in the finfish regulation book.

JUSTIFICATION: Fishing time is needed to harvest coho salmon which are entering local bays at this time. Many pink and chum salmon are schooled at the heads of several bays in the Southeastern District. The expanded closed waters areas are needed to protect the water marked-schooled salmon at the heads of the bays. Set gill net effort should not affect pink salmon escapements and purse seine effort is expected to be light.

-Continued-

EMERGENCY ORDER NO. 4-FS-M-CB-54-92

EFFECTIVE DATE: 9:00 A.M. September 2, 1992

EXPLANATION: This emergency order establishes a 9:00 A.M. September 2 until 9:00 P.M. September 5 commercial salmon fishing period in the following locations:

1. Cold Bay Section
2. Thin Point Section
3. Ikatan Bay Section
4. Unimak District
5. Uria Bay Section
6. That portion of the Swanson Lagoon Section located outside Swanson Lagoon, the Swanson Lagoon outlet channel, and within 500 yards of the outlet channel terminus.
7. Izembek - Moffet Bay Section

This emergency order supersedes the Northwestern District fishing periods listed in the regulation book.

JUSTIFICATION: Fishing time is needed to harvest coho salmon in the Northwestern District and western portion of the South Peninsula. There are large numbers of dark sockeye salmon in Swanson Lagoon and its outlet channel which need to move into closed waters before more area can be opened. Delaying the fall season until September 2 is necessary to allow chum salmon needed for escapement to move into closed waters. To spread out the effort it is desirable to have fishing periods the same throughout the western portion of the Alaska Peninsula Area. Additional locations may be opened prior to September 2 if subsequent surveys warrant. Delaying the fishing period until September 2 should give people adequate time to harvest subsistence salmon.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-55-92

EFFECTIVE DATE: 6:00 P.M. September 2, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 48 hours until 6:00 P.M. Friday during the week of August 30 - September 5 in the Cinder River Section.

JUSTIFICATION: A recent survey indicated that early coho escapement into Mud Creek was very strong, and that late coho were entering the Cinder River. Fishing effort is only about half what it was during 1990 and 1991. Weather prevented fishing during August 31. Two days additional fishing time can be allowed at this time to harvest surplus Mud Creek coho without overexploiting Cinder River stocks.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-56-92

EFFECTIVE DATE: 6:00 P.M. September 2, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 6:00 P.M. Thursday during the week of August 30 - September 5 in the Inner Port Heiden Section.

-Continued-

JUSTIFICATION: Weather has prevented fishing in the Inner Port Heiden Section during most of Monday and Tuesday this week. A 24 hour extension will enable fishermen a chance to regain lost fishing time.

EMERGENCY ORDER NO. 4-FS-M-PM-21-92

EFFECTIVE DATE: 6:00 P.M. September 2, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Ilnik Section from 6:00 p.m. Wednesday, September 2 until 12:00 p.m. (midnight) Wednesday, September 2.

JUSTIFICATION: Effort in the Ilnik Section consists of two set gill net operators. Effort earlier this season was targeted around Unangashak River coho stocks. The peak of the Unangashak River coho run is over, and effort is presently focused on Ilnik River coho stocks. Early season catch reports and aerial surveys indicate a strong early run into the Ilnik River. It is appropriate at this time to extend the Ilnik Section six hours to further evaluate the run.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-22-92

EFFECTIVE DATE: 10:00 A.M. September 3, 1992

EXPLANATION: This emergency order opens the commercial salmon fishing period in the Ilnik Section for 12 hours from 10:00 a.m. Thursday, September 3 until 10:00 p.m. Thursday, September 3.

JUSTIFICATION: Effort in the Ilnik Section consists of two set gill net operators. Effort earlier this season effort was targeted around Unangashak River coho stocks. The peak of the Unangashak River coho run is over, and effort is presently focused on Ilnik River coho stocks. Early season catch reports and aerial surveys indicate a strong early run into the Ilnik River. It is appropriate at this time to reopen the Ilnik Section for 12 hours to further evaluate the run.

=====

EMERGENCY ORDER NO. 4-F-M-SP-42-92

EFFECTIVE DATE: 9:00 P.M. September 3, 1992

EXPLANATION: This emergency order extends commercial salmon fishing time 24 hours until 9:00 P.M. Friday, September 4, 1992 in the Southeastern District.

The closed waters in effect during the September 1 to September 3 fishing period will remain in effect. All other closed waters are as listed in 5 AAC 09.350 in the finfish regulation book.

JUSTIFICATION: Fishing time is needed to harvest coho salmon which are entering local bays at this time. Many pink and chum salmon are schooled at the heads of several bays in the Southeastern District. The expanded closed waters areas are needed to protect the water marked-schooled salmon at the heads of the bays. Set gill net effort is decreasing and should not affect pink and chum salmon escapements; purse seine effort is expected to remain light.

-Continued-

EMERGENCY ORDER NO. 4-FS-M-PM-23-92

EFFECTIVE DATE: 11:00 A.M. September 4, 1992

EXPLANATION: This emergency order opens the commercial salmon fishing period in the Ilnik Section for 36 hours from 11:00 a.m. Friday, September 4 until 11:00 p.m. Saturday, September 5.

JUSTIFICATION: Effort in the Ilnik Section consists of two set gill net operators. Effort earlier this season effort was targeted around Unangashak River coho stocks. The peak of the Unangashak River coho run is over, and effort is presently focused on Ilnik River coho stocks. Catch reports indicate that the number of fish entering the Ilnik River system is on the increase, and at this time appears to be comparable to past strong years. It is appropriate at this time to reopen the Ilnik Section for 36 hours to further evaluate the run.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-57-92

EFFECTIVE DATE: 6:00 A.M. September 6, 1992

EXPLANATION: This emergency order closes the commercial salmon fishing season after September 6 in the Inner Port Heiden Section.

The commercial salmon fishing period during the week of September 6 - 12 is expanded 24 hours to 6:00 A.M. Sunday until 12:00 P.M. Midnight Wednesday in the Nelson Lagoon Section.

JUSTIFICATION: Recent surveys of the Meshik River indicate that the coho escapement is less than 1,000 fish and the run should be past its peak. The escapement should be in the 10,000 to 15,000 range by this date. Coho catches during September 2 - 3 indicate that the number of fish moving into the Inner Port Heiden Section is light.

A September 4 survey indicated that the escapement of coho salmon into the Sapsuk River is approximately 9,000 fish. Catches during August 31 through September 2 averaged between 6,000 and 7,000 coho per day which is fairly good. Based upon past years, with approximately the same escapement and catch levels at this date, the escapement goal of 20,000 to 30,000 fish can be met while reopening the Nelson Lagoon fishery 24 hours early during the week of September 6 - 12.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-24-92

EFFECTIVE DATE: 2:00 P.M. September 6, 1992

EXPLANATION: This emergency order opens the commercial salmon fishing period in the Ilnik Section from 2:00 p.m. Sunday, September 6 until 6:00 a.m. Monday, September 7.

JUSTIFICATION: The escapement into the Ilnik River system is at least 17,000 coho salmon, satisfying escapement requirements. Effort in the Ilnik Section consists of two set gill net operators. Catch reports indicate that the number of fish entering the Ilnik River system is still on the increase. It is appropriate at this time to open the Ilnik Section and provide the optimum opportunity to harvest coho salmon surplus to escapement needs while preventing overescapement.

-Continued-

EMERGENCY ORDER NO. 4-F-M-SP-43-92

EFFECTIVE DATE: 9:00 A.M. September 7, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing season from Thursday, October 1 until Friday, October 30 in the Southeastern District. This emergency order also allows 9:00 A.M. Monday until 9:00 P.M. Friday commercial salmon fishing periods in the Southeastern District.

Closed waters in the Southeastern District will remain the same as during the commercial salmon period of September 1-4.

JUSTIFICATION: Fishing time is needed to harvest coho salmon which are entering local bays at this time. The expanded closed waters areas are needed to protect the water marked-schooled salmon at the heads of the bays. Effort continues to be light throughout the district and is expected to decrease. September and October weather will likely reduce actual fishing days to about three to four days per week.

An aerial survey flown on September 2 indicated that except for three streams all sockeye, chum, and pink salmon escapements in the Southeastern District were good to excellent. With actual fishing days being about three days per week, decreasing effort, and with the additional closed water adjustments coho salmon escapements should also be good to excellent for Southeastern District streams.

=====

EMERGENCY ORDER NO. 4-F-M-SP-44-92

EFFECTIVE DATE: 9:00 A.M. September 7, 1992

EXPLANATION: This emergency order reduces the closed waters from 1,000 yards to the normal 500 yard closure at the terminus of the stream on Unga Island locally known as the Farm or Ben Green Bight.

JUSTIFICATION:

A survey of Ben Green Bight on Saturday, September 5 and recent commercial catch data from the Shumagin Islands Section, indicated that the pink salmon return for Ben Green Bight (Farm) is complete for 1992. Those pink salmon present in the lagoon should not be harvested with a 500 yard closure in effect. Two set net sites are not open with the expanded 1,000 yard closure and the fishermen that work those sites should be allowed to fish those sites.

=====

EMERGENCY ORDER NO. 4-FS-M-PM-25-92

EFFECTIVE DATE: 6:00 P.M. September 9, 1992

EXPLANATION: This emergency order extends the commercial salmon fishing period in the Ilnik Section from 6:00 p.m. Wednesday, September 9 until 6:00 a.m. Friday, September 11.

-Continued-

JUSTIFICATION: The escapement into the Ilnik River system on September 5 was at least 17,000 coho salmon, satisfying escapement requirements. Effort in the Ilnik Section consists of two set gill net operators within Ilnik Lagoon. Catch reports indicate that large numbers of fish are still entering the Ilnik River system. Extending the Ilnik Section beyond the scheduled closure at 6:00 p.m. today, will provide fishing opportunity inside Ilnik Lagoon on this evenings tide and tomorrow. It is appropriate at this time to extend the Ilnik Section 36 hours to provide the optimum opportunity to harvest coho salmon surplus to escapement needs while preventing overescapement.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-58-92

EFFECTIVE DATE: 6:00 A.M. September 10, 1992

EXPLANATION: This emergency order establishes a 6:00 A.M. September 10 until 9:00 P.M. September 11 commercial salmon fishing period in the following locations:

1. Unimak District
2. Ikatan Bay Section
3. Morzhovoi Bay Section
4. Cold Bay Section
5. Thin Point Section
6. Belkofski Bay Section
7. Swanson Lagoon Section
8. Urilia Bay Section
9. Izembek Bay Section

JUSTIFICATION: Fishing time is needed to harvest coho salmon in the western portion of the Alaska Peninsula Area. Two days should be adequate to harvest in terminal locations, weather permitting.

=====

EMERGENCY ORDER NO. 4-FS-M-CB-59-92

EFFECTIVE DATE: 9:00 P.M. September 11, 1992

EXPLANATION: This emergency order extends commercial fishing time 24 hours until 9:00 P.M. September 12 in the following locations:

1. Unimak District
2. Ikatan Bay Section
3. Morzhovoi Bay Section
4. Cold Bay Section
5. Thin Point Section
6. Belkofski Bay Section
7. Swanson Lagoon Section
8. Urilia Bay Section
9. Izembek Bay Section

JUSTIFICATION: Fishing time is needed to harvest coho salmon in the western portion of the Alaska Peninsula Area. Coho escapements in major systems are large enough to warrant a 24 hour extension of fishing time.

-Continued-

Appendix B.2. Atka-Amlia Islands emergency order summary, 1992.

EMERGENCY ORDER NO. 4-FS-F-CB-01-92

EFFECTIVE DATE: 12:01 A.M. August 17, 1992

EXPLANATION: This emergency order allows continuous commercial salmon fishing time in that portion of the Atka-Amlia Islands Management Area located outside of Korovinski Lagoon and Nazan Bay.

JUSTIFICATION: The only participants in the Atka-Amlia Islands salmon fishery are local residents with a very limited means of traveling to remote locations where most of the major pink salmon streams are located. All of the effort is presently being concentrated on Nazan Bay and Korovinski Lagoon systems. By allowing continuous fishing time in the area outside of Nazan Bay and Korovinski Lagoon, fishermen will be able to take advantage of any good weather that may occur and will be able to harvest salmon from more remote locations.

EMERGENCY ORDER NO. 4-FS-F-CB-02-92

EFFECTIVE DATE: 12:01 A.M. August 17, 1992

EXPLANATION: This emergency order expands waters closed to commercial salmon fishing to 1,000 yards from 500 yards around the terminus of the northwestern-most stream in Nazan Bay.

JUSTIFICATION: Approximately eighty percent of the fishing effort in Nazan Bay targets fish going into stream 305-52-150. The escapement is presently 1,200 pink salmon which appears to be less than half of what the escapement should be at this date. An expansion of waters closed to commercial salmon fishing is needed to insure that the 10,000 escapement objective is met.

APPENDIX C: ALASKA PENINSULA TIDES FOR 1992

Tidal Station Location: Port Moller (Entrance Point) 55 59'N., 160 34'W.
 Port Heiden 56 56'N., 158 44'W.

Note: To correct the time and height for high and low tides for Port Heiden add time and feet from the Port Moller tide table.

Port Heiden:	Time		Feet	
	High	Low	High	Low
	1:30	2:04	0.6	0.8

APPENDIX D: METHOD FOR CALCULATING INDEXED TOTAL ESCAPEMENT

Appendix D.1. Method for calculating indexed total escapement.

Unusual circumstances may cause occasional deviation, but basically the methods of calculating estimated indexed total escapements without the use of a weir or tower are as follows:

Chinook, Sockeye, Coho: These species tend to have a much longer stream life than pink and chum salmon. Therefore, the estimated total escapement is usually the peak escapement count. Carcasses are included. However, it is recognized that there are problems in large systems such as Ilnik and Caribou-David's Rivers. The basic problem on large systems is the length of time, expense, and fuel needed to do a thorough survey yet meet more pressing obligations.

The Caribou and David's River complex (including Coastal and other nearby lakes) is so massive a system for the size of its runs that complete surveys will probably never be done. The timing if such surveys would have to coincide with the peak of the South Peninsula pink and chum fisheries.

In the case of Ilnik, when a weir is not in place, numerous management surveys are done while the fishery is being managed for the Ilnik stocks. However, the peak surveys occur after the fishery has tapered off and most effort must be devoted to South Peninsula runs. However, Ilnik is a very important run and more effort is being made to accurately monitor it. The Ilnik sockeye run is of longer duration than the majority of unweired (or towered) North Peninsula sockeye streams. Ilnik sockeye also seem to have a shorter stream life than those in most other shallow water systems. Consequently, Ilnik requires at least two complete surveys or at least one complete survey with fish in the lower area during subsequent surveys being added to a peak count for the system. Many of the Ilnik figures listed in this publication are minimal.

Pink and Chum Salmon: A 21-day stream life is used to calculate total pink and chum escapements. Fish in saltwater during the final survey are added:

EXAMPLE

Survey Date	Pink	Chum	Fish at Mouth
July 10	5,000	0	5,000 P
July 17	25,000	0	10,000 P
August 1	100,000	0	10,000 P
August 15	150,000	0	12,000 P
September 1	150,000	5,000	1,000 CH 2,000 CH
Estimated Total	255,000	7,000	

The estimate of 21 days stream life was used because significant numbers of carcasses seem to appear about three weeks after adult pinks and chums first appear in Alaska Peninsula streams. It is recognized that stream life can vary, however this method is easily duplicated and is comparable from year to year. Variation in stream life is likely a much smaller factor than variation between observers.

With the exception of several small streams, there are no problems of streams being obscured by brush or trees in the Alaska Peninsula and Aleutian Islands Areas. With several exceptions, visibility of spawning grounds is outstanding during periods of normal water flow and clear weather.

APPENDIX E: PERSONNEL LIST, 1992

Appendix E.1. Personnel list, 1992.

Employee	Title / PCN	Duties And Location
Arnie Shaul	FB III 11-1033	Alaska Peninsula (excluding Southeastern District) and Aleutian Islands Areas Salmon Management Biologist, Cold Bay.
Jim McCullough	FB III 11-1265	Southeastern District - Alaska Peninsula Area Salmon Management Biologist and Alaska Peninsula / Aleutian Islands Areas Herring Management Biologist, Sand Point.
Bob Murphy	FB II 11-1407	Alaska Peninsula Area Salmon Research and Management Biologist, Port Moller.
Bob Berceci	FB II 11-1833	Alaska Peninsula Area Assistant Salmon Management Biologist, Cold Bay.
Mark Stopha	FB II 11-1275	Alaska Peninsula Area Assistant Salmon Management Biologist, Sand Point.
Rod Campbell	FB II 11-1275	Alaska Peninsula Area Assistant Salmon Management Biologist, Sand Point, Atka.
Pat Holmes	FB II 11-1273	Finfish Biologist, Kodiak, Atka, Salmon Management.
Hal Terry	Pilot I 11-1415	Chief Pilot and Aircraft Mechanic, Cold Bay.
Randy Webber	Pilot I 11-1430	Pilot and Aircraft Mechanic, Chignik.
Sharon Thies	Clerk	Clerk Typist, Kodiak.
