I. PROGRESS ON PROJECT OBJECTIVES SINCE PROJECT INCEPTION

OBJECTIVE 1: Determine the finite rate of change (lambda) for the Kenai brown bear population. 
Job/activity: collect demographic data
Data will be collected by collaring a subset of peninsula bears with vhf radio collars and following them for several years to collect data cub production, litter size, cub survival, adult survival, age of weaning, estimated age of first reproduction (where possible), inter birth interval, and annual natural mortality rate.

OBJECTIVE 2: Complete data analysis on differential reproductive fitness of Kenai brown bears. 
Job/activity: data analysis
Collaborate with Dr. Sandy Talbot of the USGS Molecular Ecology laboratory in Anchorage, Alaska to look for individual maternal lineages of Kenai Peninsula brown bears. The data to be used will include recent genotypes determined for Jackson et al. (in press) as well as any additional bears handled. Where possible, perform a genealogical reconstruction of maternal lineages for the past 10 years. Relate that information with reproductive success from past radio-collared work.

OBJECTIVE 3: Develop a model predicting demographic vigor of Kenai Peninsula brown bears. 
Job/activity: model development
Explore analysis of data from jobs 1 and 2 to construct predictive model(s) combining biological covariates (genetic relatedness, differential reproductive fitness, demographic data) of Kenai brown bears.

Objective 4: Attend conferences and training, write and present papers.
VHF collars are prone to serious frequency drift, rendering radio tracking difficult. Figure 1 indicates spring 2014 locations for all bear collars under review.

**JOB/ACTIVITY _2_:** Animal Captures… Fall 2013 captures were not conducted. During spring of 2014 we captured 15 bears (14 adult females; 1 Subadult male). Figure 1 shows most recent geographic distribution of bears. The subadult male was not collared.

**JOB/ACTIVITY _3_:** Data Analysis….Demographic data are being updated and the 2014 calculations will be updated later in the fall. The information current through Fall 2013 is listed below.

1) Mean female survivorship from 1995-2013 was 0.94 (s.d.=0.056), however hunting regulations changed in 2012. In 2012 female survivorship was 0.89 and in 2013 it was 0.79. The mean female survivorship from 2012-2013 was 0.84. Unreported mortality from 1995-2013 was 4.09 (s.d.=0.77) with a range of 3.03 – 4.76. Unreported mortality can not be calculated for every year. Data exist for years 1996, 1998, 2002, 2008, 2010, and 2013.

2) Mean age of reproduction through 2010 has been calculated to be 11yr (sd 4) with a range of 3-23 years

3) Annual cub survival and litter size has been calculated for the duration of the project (see Tables 1 & 2).

4) No additional work has been reported on this activity.

**OBJECTIVE 2:**

**JOB/ACTIVITY _1_:** No additional work has been reported on this activity.

**OBJECTIVE 3:**

**JOB/ACTIVITY:** No additional work has been reported on this activity

**Objective 4:**

**JOB/ACTIVITY:** The following manuscripts were completed, submitted, or accepted this year under this grant.

Talbot, S.L. G. K. Sage, S. D. Farley. (in prep) Brown bears of the Kenai Peninsula are genetically isolated from mainland south central and southwestern Alaskan populations.
