*Revise 334-40-11000-2490-3416. add new stream - 4013 w/ coho salmon spawning*

**IMPORTANT:** Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

**Comments:** Isaac Slough is technically channel of the Delta Clearwater River (DCR), however it is not navigatable by boat and would not normally be surveyed for coho salmon. Isaac Slough is shallow with a thick layer of organic material on the bottom, there are many spring upwellings and other springs throughout this slough increasing flow. This submission of Isaac Slough is to nominate it to AWC, provide a description, and add aerial coho salmon survey counts to the AWC database. A description of Isaac Slough is described in the word document (Isaac Slough.doc) From 1994-1998, ADF&G conducted aerial surveys of Isaac Slough and 34 other non-navigatable springs. Isaac Slough is approximately 0.35 miles in length and spawning coho salmon were observed in four of the five aerial survey years, counts ranging from 0-700. Isaac Slough has its upper confluence with the Delta Clearwater River (N64° 03.207', W145° 25.751') and its confluence with the lower end of the Delta Clearwater River (N64° 03.333', W145° 26.200'). As an observation, the springs in this area despite the small size (Isaac Slough, Caleb, Christie, and Parker) had the highest concentration of spawning fish of all the DCR springs. There is high quality coho salmon rearing habitat in this spring system. TOPO! software was used to calculate distance and obtain lat/long locations.

Name of Observer (please print): James F. Parker

**From:** Parker, Fronty (DFG)  
**Sent:** Thursday, May 05, 2011 7:36 AM  
**To:** Johnson, J D (DFG)  
**Subject:** AWC nomination: Isaac Slough (334-40-11000-2490-3416-4012)  
**Attachments:** Isaac Slough 04-14-2011.xls; Isaac Slough.doc; AWC number system for DCR.xlsx

Isaac Slough is one of 21 tributaries into the Delta Clearwater River that has aerial coho salmon survey data. This is a new AWC nomination and the sequence for Isaac Slough is shown in the spreadsheet "AWC number system for DCR.XLSX". Descriptive information and aerial coho salmon survey data for Isaac Slough is added to this nomination.

-Fronty

Isaac Slough (local name, no USGS name)

04/14/2011

**Anadromous stream catalog number** 334-40-11000-2490-3416-4012

**Description:** Isaac Slough is a north directed channel of the of the Delta Clearwater River starting at mile 8.5 down to 8.2 (Figure 1). Isaac Slough is shallow with a thick layer of organic material on the bottom; there are many spring upwelling and other contributing springs throughout this slough increasing flow. Spawning coho salmon have been observed and counted in four of the five years aerial surveys in Isaac Slough were conducted. Of the four springs in this area (Caleb, Christie, Isaac slough, and Parker) spawning conditions must be ideal, for the concentration of spawning fish is highest here.

The Delta Clearwater River (DCR) is entirely spring fed. A report written in 1991 (Parker, J. F. 1991. Status of Coho Salmon in the Delta Clearwater River of Interior Alaska. Alaska Department of Fish and Game, Fishery Data Series 91-4, Anchorage.) gives a summary of coho life history and data collected on the DCR. The report documents the DCR being only 20 miles in length, as having the largest spawning concentration in the Yukon River drainage, the largest coho sport fishery in the Tanana River drainage, and an extensive record of coho escapement index counts. Adult coho salmon distribute throughout the DCR to spawn. Coho salmon eggs hatch in February and March and coho salmon fry emerge from the gravel in May, approximately 6 months after spawning. The springs provide consistent flows, little change in water temperature, highly productive aquatic communities, and favorable over-wintering habitat for rearing coho salmon. The majority of the juvenile coho salmon rear in the DCR for 1 - 3 years before smolting, and spend 1 year in the ocean before returning (Parker 1991).

Isaac Slough is a channel of the Delta Clearwater River (Figure1). Isaac Slough is shown on the USGS map but only as part of the Delta Clearwater River. For AWC purposes I propose to add this slough to incorporate coho counts and distinguish this important habitat area. Water flows into the upper end of Isaac Slough from Delta Clearwater River (N64° 03.207', W145° 25.751') and flows a total of 0.35 mile to the downstream confluence with the Delta Clearwater River (N64° 03.333', W145° 26.200').

DF&G conducts an annual coho salmon survey to assess the coho salmon escapement goal of 5,200–17,000. Annual coho counts since 1972 to the present are found in Table 1 (Parker, J. F. 2009. Fishery management report for sport fisheries in the Upper Tanana River drainage in 2008. Alaska Department of Fish and Game, Fishery Management Report No. 09-47, Anchorage.) From 1994-1998, aerial coho surveys were conducted to determine numbers of spawning coho salmon in non-boatable portions of the DCR. A significant portion of coho salmon are found spawning in non-navigatable portions of the river in short spring tributaries contributing to the DCR. Aerial counts for coho salmon in areas not counted by boat, were 21.9%, 23.8%, 19.0%, 17.1%, and 20.0% (averaging 20.36%) of the escapement, respectively (Table 1). The average proportion is then applied to the mainstem DCR count and the resultant estimate for the non-navigable component is added to the mainstem count to obtain an estimate of total escapement. From 1994-1998, the helicopter count for Isaac Slough is presented in Table 2.

**Anadromous species present:** Coho salmon (spawning and rearing).

**Other Species;** round whitefish, Arctic grayling, long nose suckers, and slimy sculpins.

**Anadromous species data collection:**

This nomination is to provide a description for this water and provide aerial coho survey data.
