OBSERVATION INFORMATION

Species	Date(s) Observed	Spawning	Rearing	Present	Anadromous
Coho	2/1/01			20+ remains	<input checked="" type="checkbox"/>
Chum salmon	2/1/01			5 remains	<input checked="" type="checkbox"/>
Pink salmon	2/1/01			5 remains	<input checked="" type="checkbox"/>
					<input type="checkbox"/>
					<input type="checkbox"/>

**IMPORTANT:** Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

**Comments:** A tributary to the Katlian River was surveyed on February 1, 2001 during a review of the proposed road reconstruction. A 30' log stringer bridge is located approximately 10,400 feet up the existing road alignment from Katlian Bay. The stream banks were littered with coho, chum, and pink salmon remains; jaws, gill covers, vertebrae, etc. Upstream of the bridge the channel heads eastward towards the base of the cliffs. Below the bridge the stream meanders through alder until it reaches the main Katlian River. Substrate is gravel with deposits of sand and clay. Stream width at the outlet is 12 feet with a depth of 24 - 30". Linda Speerstra (H&R) and Jack Whitman (WC) participated in the survey.
