**IMPORTANT:** Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

**Comments:** Location; Township 27S Range 34E Section NW 1/4 36 ; Latitude N59 degrees 32.520, Longitude W139 degrees 35.125 (NAD27). Stream is number 3 on the map.

Stream characteristics: Width .6 - .8 m; depth .3 - .6m; muskeg/wetlands with clay and organic soils, grass/sedge and some willow. Upper extent. Affected by Colorado Road interception. Good rearing habitat. Temperature 9 degrees C.

Stream surveys were part of the Yakutat Fish Habitat and ATV Trail Assessment project. Field crews surveyed streams for fish using baited minnow traps. Soak times for traps were usually less than 30 minutes per trap/ two traps per sample site. Captured fish were identified and released on-site. Field teams were comprised of ADF&G and Yakutat Ranger District personnel.
