IMPORTANT: Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

Comments: Location; Township 28S Range 37E Section NW 1/4 36; Latitude N59 degrees 26.903, Longitude W139 degrees 4.027 (NAD27). Stream is number 39 on map.

Stream characteristics: Coho juveniles in good numbers present. Stream showed evidence of seasonal surface water influence and changing vegetation...especially at the upper extent. Stream characteristics change to shallow rearing seasonal stream. Width .2-.6m; depth .1-.3m; temperature 9 degrees C.

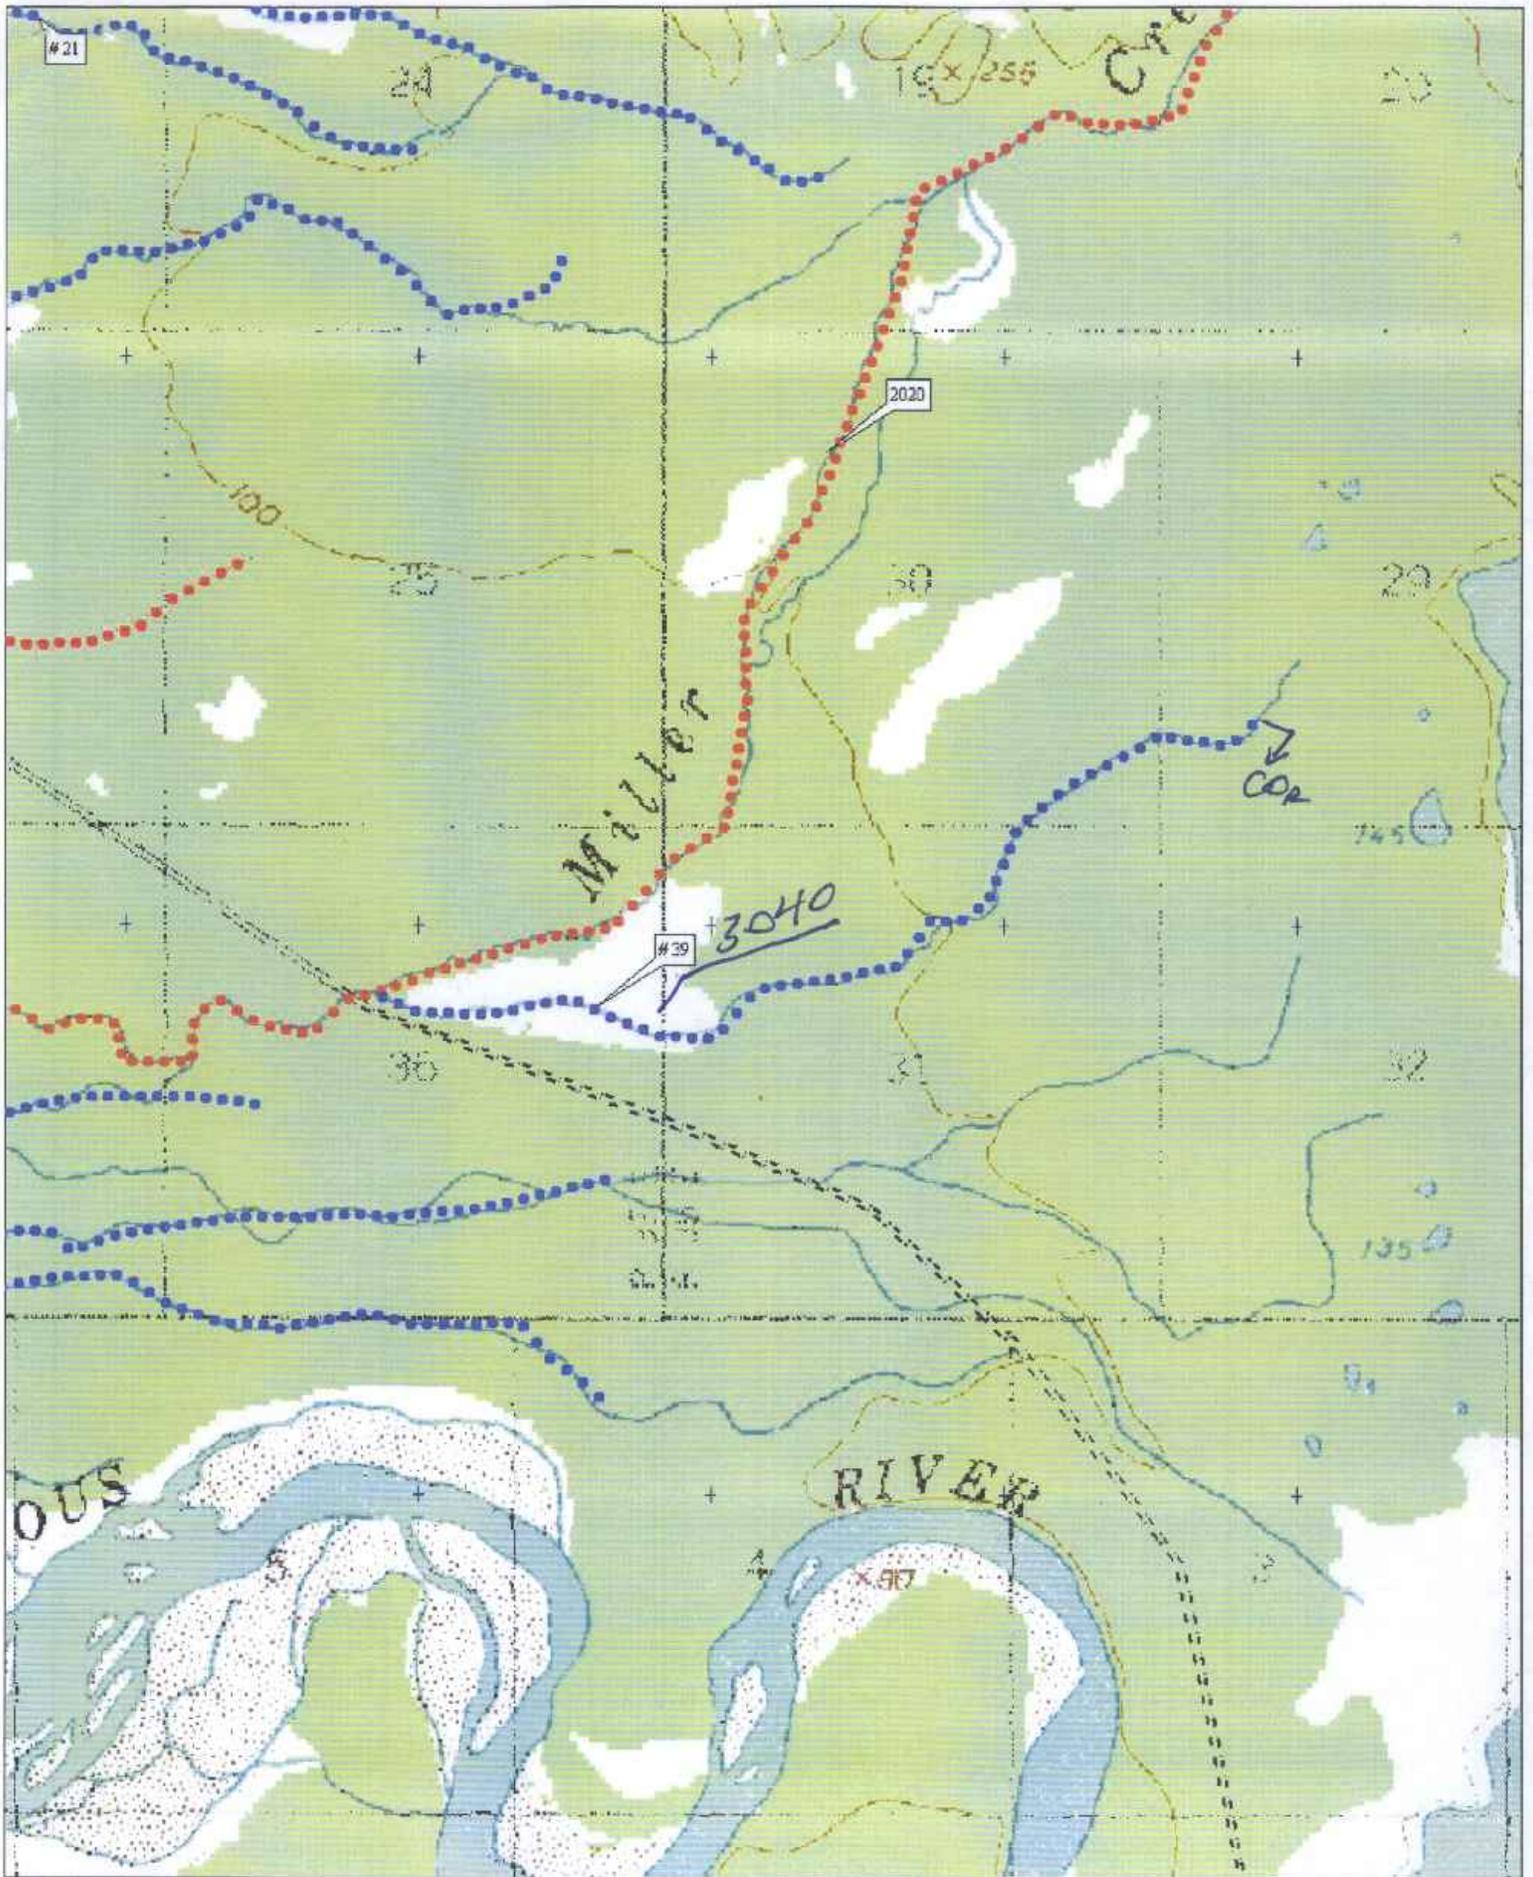

Stream surveys were part of the Yakutat Fish Habitat and ATV Trail Assessment project. Field crews surveyed streams for fish using baited minnow traps. Soak times for traps were usually less than 30 minutes per trap/ two traps per sample site. Captured fish were identified and released on-site. Field teams were comprised of ADF&G and Yakutat Ranger District personnel.
