OBSERVATION INFORMATION

Species	Date (s) Observed	Spawning	Rearing	Migration	Anadromous
Sockeye	October 1, 2003	100 adults			

**IMPORTANT:** Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as any other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

Comments : On October 1, 2002 I watched approximately 100 adult sockeye enter this stream (from Chuck Lake) and begin spawning. Although this stream is small it appears to contain very good spawning habitat. Approximately 200 meters of the stream are anadromous. Average channel width is only about three feet. Average depth is only a few inches and adult fish may only be able to migrate up this stream after a good rain (this is what occurred on October 1, 2002). The stream flows from north to south and enters the lake on the northwest corner of the lake in section 21 T70S R78E CRM (see attached map). Digital photos available.
