OBSERVATION INFORMATION

Species	Date(s) Observed	Spawning	Rearing	Migration	Anadromous
Coho	8/9/95		X		

IMPORTANT: Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as any other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

Comments: A fish ladder was constructed on Slippery Creek in 1988. I began electroshocking the headwaters of the three major tributaries and stopped shocking when I began getting coho. I continued downstream and visually observed many rearing coho, even in areas lacking large woody debris. Overall, coho juveniles were well distributed throughout the three major tributaries indicated on the map.
