OBSERVATION INFORMATION

Species	Date(s) Observed	Spawning	Rearing	Present	Anadromous
Coho Salmon	8/11/97		25+		<input checked="" type="checkbox"/>
					<input type="checkbox"/>
					<input type="checkbox"/>
					<input type="checkbox"/>
					<input type="checkbox"/>

IMPORTANT: Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

Comments: A small amount of coho salmon rearing habitat exists here before the stream has a steep gradient break. Within the area that salmon could rear, fry densities were good and the stream has good structure and cover. The overall shoreline in the area is fairly steep and many streams entering saltwater have steep gradients. Some pink carcasses were also present but I could not determine if high tides and wind/wave action may have deposited them here in the small bight that occurs. As such, I am only recommending that this stream be catalogued for rearing coho salmon.
