					<input type="checkbox"/>

IMPORTANT: Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

Comments: On August 10, 1997 approximately 2000 adult pink salmon were observed in the mouth of this unnamed stream south of Lynn Sisters Island, with at least 20 adult pink salmon present in the upper stream starting to spawn. The intertidal area is over 100 yards long and likely supports spawning populations of pink salmon. The creek enters the forest shortly above the intertidal area and is 5' to 10' wide with a cobble/gravel substrate, with a 3 - 4% grade. This stream appears to contain good habitat for pink salmon, but it is only approximately 200 meters before the slope increases and habitat ends.
