OBSERVATION INFORMATION

Species	Date(s) Observed	Spawning	Rearing	Present	Anadromous
Coho	6/9/98			10	<input checked="" type="checkbox"/>
Dolly Varden	6/9/98		1		<input type="checkbox"/>
					<input type="checkbox"/>
					<input type="checkbox"/>
					<input type="checkbox"/>

IMPORTANT: Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

Comments: UPPER EXTENT CORRECTION. This tributary of the main river was surveyed and videotaped by a low level helicopter flight. The gradient of the tributary is less than 2% and crosses a flat terrace east of the Suckling Hills. The tributary originates in the foothills of the Suckling Hills in Section 28, Township T21 South, Range 9 East. The stream flows across Section 27 before joining the previously catalogued portion of the stream. Coho fry and Dolly Varden char were minnow trapped and/or netted in the mainstem of the river and in tributaries above and below this particular tributary. No blocks to fish were discovered. The upper extent of the tributary is the base of the foothill where the gradient increases significantly.
