**IMPORTANT:** Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

**Comments** extended stream w/ Coho Salmon rearing Ref nom # 13-067

During joint AKSSF and A-1 Timber Consultant sampling, I used an electrofisher in an unnamed tributary to Roslyn Creek in the area of proposed timber harvest activities to document the presence of anadromous fish (Figures 1 and 2). See the June 13 and 14, 2013 trip report.

SUBJECT: AKSSF AWC Survey: Kodiak Island  
June 2013

On June 13 and 14, 2013, I joined Dave Nesheim, A-1 Timber Consultants (A-1), and Dillon Shults, Alaska Department of Fish and Game (ADF&G) on Kodiak Island for the purpose of sampling waters in the area of proposed harvest activities to document the presence of anadromous fish. The information gathered will be used to submit official nominations for inclusion in the Anadromous Waters Catalog and its companion Atlas. Inclusion in the Anadromous Waters Catalog will conserve salmon habitat by providing the 66-foot riparian retention area protection required under the Forest Resources and Practices Act (FRPA). A water body listed in the Anadromous Waters Catalog is also afforded additional protection under State law at AS 16.05.871. The weather conditions were clear, and warm.

On the morning of June 13, we drove to "Big Creek" (Figures 1 and 2). Big Creek flows into the Chiniak River (Stream No. 259-25-10040). We walked downstream about 1 linear mile into Kodiak Island Borough (KIB) land and used an electrofisher to sample upstream through the KIB land, and entered Leisnoi, Inc. owned land. Throughout the reach we captured up to 25 juvenile coho salmon (20-110 mm fork length (FL)) (Figures 3 and 4). Over 100 Dolly Varden were also captured (15-115 mm FL).

Big Creek was sampled in May 2012 about 0.5 linear miles below our June 2013 sampling effort. During the 2012 sampling effort, Juvenile coho and pink salmon were captured. The reach that was sampled in 2012 has been nominated to the Anadromous Waters Catalog. The additional reach that contained coho salmon will be nominated to the Anadromous Waters Catalog.

Near the KIB property line the stream flow became subsurface for about 0.5 linear miles (Figure 5). During a Forest Resources Practices Act inspection conducted at this location June 4, 2013, water was flowing throughout the dry reach. No physical barrier to fish passage was observed.

On the morning of June 14 we returned to Big Creek and began sampling above the dry reach at the point where stream flow was present. We sampled about 1.0 linear mile (Figure 6). We captured or observed about 600 Dolly Varden (Figure 7). Big Creek will be sampled an additional time in the fall of 2013 during a wet period to determine if adult or juvenile salmon

are present in the stream reach upstream of the dry reach.

We drove to an unnamed tributary to Roslyn Creek (Stream No. 259-25-10010). We sampled about 1,800 linear feet of the stream (Figure 8). We captured or observed about 200 juvenile coho salmon (Figures 9 and 10). The unnamed stream will be nominated to the Anadromous Waters Catalog. Additional habitat will be sampled during a later sampling effort.

The ADF&G is currently planning on returning to Kodiak for a sampling effort in July 2013.
