OBSERVATION INFORMATION

Species	Date(s) Observed	Spawning	Rearing	Present	Anadromous
Coho Salmon	8/21/2013		X		<input checked="" type="checkbox"/>
					<input type="checkbox"/>
					<input type="checkbox"/>
					<input type="checkbox"/>
					<input type="checkbox"/>

**IMPORTANT:** Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

**Comments**  
 During an joint AKSSF and Koncor stream survey, I captured juvenile coho salmon in the unnamed tributary (Figures 1 and 2). See the August 20-21, 2013 trip report.  
Add new stream w/ coho salmon rearing

Habitat Biologist

SUBJECT: AKSSF AWC Survey: Afognak Island  
August 2013

On August 19 to 21, 2013, I joined Keith Coulter, Koncor, Greg Harris, Afognak Native Corporation (ANC), and Ryan Snow, Alaska Department of Fish and Game (ADF&G) on Afognak Island for the purpose of sampling waters in the area of proposed harvest activities to document the presence of anadromous fish. The information gathered will be used to submit official nominations for inclusion in the Anadromous Waters Catalog and its companion Atlas. Inclusion in the Anadromous Waters Catalog will conserve salmon habitat by providing the 66-foot riparian retention area protection required under the Forest Resources and Practices Act (FRPA). A water body listed in the Anadromous Waters Catalog is also afforded additional protection under State law at AS 16.05.871. The weather conditions were cloudy and cool. Because of a flight delay leaving Anchorage, no sampling was conducted August 19.

On the morning of August 20, Mr. Harris, Mr. Snow and I drove the 210 Road to Stream No. 252-31-10007 (Figure 1). Timber on lands managed by Koniag Native Corporation will be harvested in the future and Mr. Harris requested the ADF&G confirm the presence of a barrier to fish passage below the proposed timber units. We observed about 10 adult pink salmon in the lower reach of the stream. We used an electrofisher to sample about 2,500 linear feet of the stream. We captured three juvenile coho salmon (85-95 mm fork length (FL)) (Figure 2). We captured 2 Dolly Varden about 255 mm FL (Figure 3). The Dolly Varden were likely anadromous. We located a 25-foot high barrier about 3,000 linear feet above Izhut Bay (Figure 4). The pink salmon and anadromous Dolly Varden will be nominated for update to the Anadromous Waters Catalog.

We drove the 210 Road to an unnamed stream that flows into Sapos Bay. Timber on lands managed by Koniag Native Corporation will be harvested in the future and Mr. Harris requested the ADF&G confirm the presence of a barrier to fish passage exists below the proposed timber units. We walked to the bay and observed 2 adult pink salmon in the stream about 150 linear feet above the bay. We continued upstream about 1,000 linear feet and observed about 25 Dolly Varden with an estimated length of 200-300 mm fork length (FL)). The Dolly Varden were likely anadromous. Directly upstream of the Dolly Varden was a 7-foot high barrier (Figure 5). The unnamed stream will be nominated to the Anadromous Waters Catalog for pink salmon and anadromous Dolly Varden.

On the morning of August 21, we drove the 520 Road to Unit N-29. The unit is located on land managed by Koncor. We sampled an unnamed stream and tributary to the stream that flows into Izhut Bay (Figure 6). We observed about 8 adult pink salmon 300 linear feet above the stream mouth. We continued up the unnamed tributary about 1,500 linear feet. We captured about 35 juvenile coho salmon (45-75 mm FL) (Figure 7). We ended the survey when we entered a previously harvested unit that may have been over 25 years old. No riparian retention area was present (Figure 8).

We walked back to the unnamed stream and sampled about 1,700 linear feet to a 25-foot high barrier (Figure 9). We observed 2 adult pink salmon and captured 20 juvenile coho salmon (55-65 mm FL). We captured 45 Dolly Varden (45-115 mm FL). The unnamed stream and tributary stream will be nominated to the Anadromous Waters Catalog for pink salmon and coho salmon.

The ADF&G is currently planning on returning to Afognak for a sampling effort in September 2013.
