IMPORTANT: Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

Comments

During joint AKSSF and A-1 Timber Consultant sampling, we observed adult coho salmon spawning (Figures 1 and 2). See the September 18 and 25, 2013 trip report.

SUBJECT: AKSSF AWC Survey: Kodiak Island
October 2013

On October 18, 2013, I joined Dave Nesheim, A-1 Timber Consultants (A-1), and Jeanette Alas, Alaska Department of Fish and Game (ADF&G) on Kodiak Island for the purpose of sampling waters in the area of proposed harvest activities to document the presence of anadromous fish. On October 25, 2013, I joined Dave Nesheim, A-1 for an additional sampling effort. The information gathered will be used to submit official nominations for inclusion in the Anadromous Waters Catalog and its companion Atlas. Inclusion in the Anadromous Waters Catalog will conserve salmon habitat by providing the 66-foot riparian retention area protection required under the Forest Resources and Practices Act (FRPA). A water body listed in the Anadromous Waters Catalog is also afforded additional protection under State law at AS 16.05.871. The weather conditions were rain and fog, becoming cloudy and cool.

On the morning of October 18, Mr. Nesheim, Ms. Alas, and I drove to an unnamed tributary to Roslyn Creek (Stream No. 259-25-10010). The stream is located on lands managed by Leisnoi Native Corporation. We walked upstream about 2,000 linear feet from the Chiniak Highway through a beaver pond (Figure 1). We used an electrofisher to sample the stream and beaver pond (Figure 2). We captured 14 juvenile coho salmon (40-100 mm fork length (FL)) (Figure 3). *14-005*

At the head of the beaver pond, a stream with multiple tributaries entered the pond. We walked up the right fork about 2,500 linear feet and observed 4 adult coho salmon spawning and an additional 10 adult coho salmon were present (Figure 4). We observed about 20 adult pink salmon carcasses throughout the lower reach. We captured 10 Dolly Varden (70-155 mm FL) (Figure 5). We ended our survey where the stream gradient became a barrier to fish passage. The unnamed tributary will be nominated to the Anadromous Waters Catalog. *14-006*

We returned to the stream fork and walked up the left stream fork about 2,500 linear feet. We captured 2 juvenile coho salmon (95-100 mm FL) and observed 2 anadromous Dolly Varden (250 mm FL). We ended our survey at the headwaters of the stream. The unnamed tributary will be nominated to the Anadromous Waters Catalog.

On the morning of October 25, Mr. Nesheim and I walked an unnamed tributary of East Fork Twin Creek (Stream No. 259-25-10020-2001-3002). Mr. Nesheim reported that Kent Cross, A-1 observed live adult pink salmon in the unnamed tributary in late summer and requested I confirm that pink salmon are present in the tributary. We walked about 2,000 linear feet of the stream and observed about 85 pink salmon carcasses. We ended our survey where the stream gradient became a barrier to fish passage. We walked up three additional tributaries to the main tributary. No pink salmon carcasses were observed. We delineated where the upper extent of fish habitat exists at the point where the stream gradient becomes a barrier to fish passage. The main unnamed tributary will be nominated to the Anadromous Waters Catalog.

We drove to West Fork Twin Creek (Stream No. 259-25-10020). We walked up two tributaries to West Fork Twin Creek. The streams are located in Sections 35 and 36, T. 29 S., R. 19 W., S.M. No fish sampling was conducted. We delineated where the upper extent of fish habitat exists at the point where the stream gradients becomes a barrier to fish passage. The streams will be sampled for fish presence in the spring of 2014.

The ADF&G is currently planning on returning to Kodiak for a sampling effort in April 2014.
