OBSERVATION INFORMATION

Species	Date(s) Observed	Spawning	Rearing	Present	Anadromous
Steelhead Trout	6/14/2014		X		<input checked="" type="checkbox"/>
Dolly Varden	6/14/2014			X	<input type="checkbox"/>
					<input type="checkbox"/>
					<input type="checkbox"/>
					<input type="checkbox"/>

IMPORTANT: Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

Comments

During a joint AKSSF survey, I used an electrofisher to sample an unnamed tributary to Thorsheim River (Figure 1, IDENT 085). See the attached June 14-16, 2014 trip report.

Add new stream w/ Steelhead trout & Dolly Varden rearing

Name of Observer (please print): Will Frost, Habitat Biologist
 Signature: [Signature] Date: 6/30/2014

SUBJECT: AKSSF AWC Survey: Afognak Island
June 2014

On June 14 through 16, 2014, I joined Jacob Cunha, Alaska Department of Fish and Game (ADF&G) on Afognak Island for the purpose of sampling waters in the area of proposed harvest activities to document the presence of anadromous fish. The information gathered will be used to submit official nominations for inclusion in the Anadromous Waters Catalog and its companion Atlas. Inclusion in the Anadromous Waters Catalog will conserve salmon habitat by providing the 66-foot riparian retention area protection required under the Forest Resources and Practices Act (FRPA). A water body listed in the Anadromous Waters Catalog is also afforded additional protection under State law at AS 16.05.871. The weather conditions were clear and warm becoming rain.

On the morning of June 14, Mr. Cunha and I flew with Maritime Helicopters of Kodiak to Thorsheim River (Stream No. 251-30-10020) on Afognak Island. The stream is on land managed by Uyak Natives Inc. (Uyak). We used a helicopter to access the river because the nearest road to the river is about 12 kilometers away over uneven and steep terrain (Figure 1). We landed in the lower river and walked to an unnamed tributary that flows into the Thorsheim River estuary. We used an electrofisher to sample 670 meters of the stream (Figure 2). We captured 35 Dolly Varden (50-85 mm fork length (FL)). We observed salmon bones on the streambanks. The unnamed stream will be surveyed for adult fish in the fall of 2014.

We walked up Thorsheim River about 900 meters to an unnamed tributary that was about 9 meters wide with a moderate gradient (Figure 3). We sampled the lower reach and captured 2 juvenile steelhead trout (80 and 100 mm FL) (Figure 4). We continued sampling upstream and captured 7 Dolly Varden (55-150 mm FL) (Figure 5). We ended our survey at a 4 meter high barrier (Figure 6). The unnamed tributary will be nominated to the Anadromous Waters Catalog.

We returned to Thorshiem River and sampled an unnamed tributary on the opposite side of the river. We sampled 80 meters of the unnamed tributary ending our survey at a 1 meter high barrier. We captured 3 Dolly Varden (35-50 mm FL).

We sampled Thorshiem River at the outlet of the previously sampled unnamed stream and captured 2 juvenile sockeye salmon (95 mm FL) and 5 juvenile steelhead trout. No length measurements were taken for the steelhead trout. The juvenile sockeye salmon and juvenile steelhead trout will be nominated for update to the Anadromous Waters Catalog.

We walked down the Thorsheim River and sampled 76 meters of an unnamed tributary that was less than 1.5 meters wide. We captured 7 Dolly Varden (40-55 mm FL). A tributary was observed flowing into the sampled stream. Because of time constraint, the tributary was not sampled.

We walked down the Thorsheim River and sampled an additional stream that flows into the estuary. We sampled 308 meters of the stream and captured 2 young-of-year pink salmon (40 and 45 mm FL) (Figure 7). An additional 10 Dolly Varden were captured. No length measurements were taken for the Dolly Varden. A tributary was observed flowing into the sampled stream. Because of time constraint, the tributary was not sampled. The unnamed stream will be nominated to the Anadromous Waters Catalog. While returning to Kodiak in the helicopter we identified two additional streams on Uyak land that will be sampled in the fall of 2014.

On the morning of June 15, Mr. Cunha and I flew to Afognak Island. We drove the 900 Road to Stream No. 252-32-10010-2021. The stream flows through Unit O-58 on land managed by Koncor. We walked up the lower reach to determine if tributaries to Stream No. 252-32-10010-2021 are located in the unit. No tributaries were found. We sampled the lower reach of the stream and captured 4 juvenile coho salmon (45-60 mm FL). We walked about 1,300 meters to the headwater lake (Figure 8). We observed about 10 juvenile coho salmon in the lake. While walking back to the car, we used a Garmin GPS to map the correct location of the stream. The correct location of the stream will be nominated for update to the Anadromous Waters Catalog. The presence of juvenile coho salmon in the headwater lake will be nominated to the Anadromous Waters Catalog.

On the morning of June 16, Mr. Cunha and I drove the 1100 Road near mile post 7.5. We walked to an unnamed lake that flows into Stream No. 251-82-10050-2039. The stream is located on land managed by Afognak Native Corp. We set two baited minnow traps in the lake. The traps soaked about 4 hours. The traps captured 4 juvenile coho salmon (70-130 mm FL) (Figure 9). The unnamed lake will be nominated to the Anadromous Waters Catalog.

We walked to the upper extent of the specified reach for Portage Creek (Stream No. 251-82-10050). We set two baited minnow traps in an unnamed lake that flows into Portage Creek. At the inlet end of the lake we located a beaver dam that was about 6 meters high. We set two minnow traps in the lake above the beaver dam. The traps soaked about two hours. The traps located in the lake that flows to Portage Creek captured two Dolly Varden (90 mm FL) and 10 stickleback. We observed 5 juvenile coho salmon below the lake outlet. The traps located above the beaver dam captured 30 stickleback. The lake above the beaver dam was sampled during the May 2014 sampling effort. Stickleback and Dolly Varden were captured during the May effort. The juvenile coho salmon in Portage Creek will be nominated for update to the Anadromous Waters Catalog.

The ADF&G is currently planning on returning to Afognak for a sampling effort in July 2014.
