

CARROLL INLET
 101-45-99
 5-14-73

Steeper gradient. Stream narrows with some velocity to the flow again. Gravel increases in size to 2"-6". Can see lake opening (10 min.). Turned back, getting dark.

Walked this tributary to here. Stream narrows and becomes swifter above the pool.

This area is the same as from Stations 4 - 5.

Flat gradient - sluggish beaver slough type area. Stream banks stable, walking easier. Timber poor. A little beaver sign. Gravel is smaller with much sand, stream is deeper, wider and sluggish here.

Stream gradient steepens, depth and velocity increase. Very little pool and rearing area. Stream banks remain stable, utilization by fish would be limited in this area. Walking becomes more brushy and difficult. Timber very poor.

Small island

Stream steepens and narrows somewhat (not excessive). Velocity greater and most spawning would be limited to the stream edges. Gravel remains large. Stream banks stable. Timber poor.

Large log jam (only one on stream) A few trees down along the entire stream length but only a few.

Gravel larger size (4"-6"). Velocity a little swift for excellent utilization but definitely has some good spawning area. Some good pool rearing areas - a little beaver sign, stream banks stable. Timber poor and scrubby.

Small island

Grass flats
