## **2017 NORTON SOUND SALMON FISHERIES OUTLOOK AND MANAGEMENT STRATEGIES**

### **INTRODUCTION**

Norton Sound is comprised of two fishing districts, the Norton Sound District and the Port Clarence District (Figure 1). The Norton Sound District extends from Cape Douglas south to Point Romanof and includes over 500 miles of coastline. The area open to commercial salmon fishing is divided into six subdistricts. Each subdistrict contains at least one major spawning stream with commercial fishing effort located in the ocean near stream mouths. The Port Clarence District encompasses all waters from Cape Douglas north to Cape Prince of Wales. The commercial salmon fishing area is adjacent to the communities of Brevig Mission and Teller (Figure 2).

Alaska Department of Fish & Game (ADF&G, department) staffing for salmon management within Norton Sound includes three permanent biologists, a program technician and 15 seasonal employees during the summer months. Norton Sound Economic Development Corporation (NSEDC) funds 21 interns to work on department projects and cooperative projects between NSEDC and ADF&G. Anticipated department management projects in 2016 include: Kwiniuk River counting tower; Nome River weir; Solomon River weir; periodic aerial surveys of index spawning streams; and catch sampling and monitoring efforts at Unalakleet. Cooperative projects with other agencies will occur at the Unalakleet River weir (BLM, NSEDC and Unalakleet IRA); Fish River tower (NSEDC); and Snake River weir (NSEDC). Department staff will also track the salmon escapement counts reported on other cooperative projects administered by NSEDC on the following rivers: North, Shaktoolik, Inglutalik, Eldorado, and Pilgrim.

### **2017 RUN OUTLOOK**

Salmon outlooks and harvest projections for the 2017 salmon season are based on qualitative assessments of parent-year escapements, sibling relationships, subjective determinations of

freshwater overwintering and ocean survival, and in the case of the commercial fishery, the projections of local market conditions. The Chinook salmon run is expected to be weak and no commercial fishing targeting Chinook salmon is expected in Norton Sound. Additional subsistence restrictions for Chinook salmon are expected in southern Norton Sound. Sales of incidentally harvested Chinook salmon will not be allowed in Subdistricts 5 and 6 if Chinook salmon subsistence fishing restrictions are imposed. Elsewhere incidentally caught Chinook salmon in commercial fisheries will be allowed to be sold. Chum salmon runs are expected to be below average and the harvest is expected to be 50,000 to 80,000 fish. The department expects the pink salmon run to be average for an odd-numbered year and the harvest could range from 25,000 to 75,000 fish. No pink salmon directed fishing periods would be expected because of buyer interest in more valuable salmon species and the pink salmon harvest would likely be an incidental harvest only. However, the department does have the authority to increase fishing net aggregate length from 100 fathoms to 200 fathoms if there were a pink salmon directed fishery and the harvest would be expected to exceed 100,000 pink salmon. Also, in June, a seine fishery targeting pink and chum salmon in Subdistricts 5 and 6 could occur with the requirement that Chinook salmon be returned to the water unharmed. The coho salmon run is expected to be average to above average based on ocean survival conditions in recent years. The commercial harvest is expected to be 90,000 to 120,000 fish. In the Port Clarence District the department expects the commercial fishery to remain closed because the in-river goal of 30,000 sockeye salmon at Pilgrim River is not expected to be reached. Subsistence fishing closures in the Pilgrim River are not expected, but the department will limit sockeye salmon subsistence harvest to 25 fish initially, but will increase or waive the limit if the run is similar to the last two years.

## **MANAGEMENT STRATEGIES**

Department staff will manage salmon fisheries to ensure escapement goals are achieved. Subsistence fishing may need to be restricted or closed if concerns for escapement arise. Commercial fishing will be allowed if a market is available and if there is an adequate surplus in excess of escapement and subsistence needs. Informational updates will be broadcast periodically over Nome public radio stations to inform fishermen of current regulations, catches, escapements and ADF&G activities and biologists will attempt to visit each fishery to disseminate fishery information and answer questions. The Unalakleet office will be open daily, except Sunday, throughout the season beginning the second week of June. The Unalakleet office number is 624-3921. The public may also call the Nome office toll-free number at 1-800-560-2271 or the regular number of 443-5167 for information.

### **NOME SUBDISTRICT**

Subdistrict 1 (Nome) salmon management in 2017 is expected to be similar to last year. Commercial fishing time is expected with the possibility of commercial fishing periods beginning in early July. Since Tier II chum salmon subsistence fishing was suspended in 2006, the subdistrict-wide escapement goal range of 23,000 to 35,000 fish has been reached or exceeded in all years except in 2009. In the last five years the escapement has ranged from 52,000 to 108,000 fish. Three rivers have chum salmon escapement goal ranges; Eldorado (6,000 to 9,200), Nome (2,900 to 4,300) and Snake (1,600 to 2,500). The range has been exceeded at Eldorado River the last five years, met or exceeded at Nome River four out of the last five years and exceeded at the Snake River four out of the last five years.

At the January 2016 Alaska Board of Fisheries meeting the board increased subsistence fishing time in the marine and fresh water subsistence areas. In marine waters, subsistence fishing is allowed 7 days a week prior to June 15 and after August 15. From June 15 through August 15 the marine waters of Nome Subdistrict, west of Cape Nome, will be open to set gillnet fishing from 6 p.m. Wednesday until 6 p.m. Monday unless closed by emergency order. Marine waters east of Cape Nome will remain open 7 days a week throughout the season unless closed by emergency order. In fresh waters, subsistence fishing is open 7 days a week prior to June 15 and after August 31. Beginning June 15 through August 31, subsistence set gillnet fishing will be open in fresh waters from 6 p.m. Wednesday until 6 p.m. Monday. Subsistence permits are required when subsistence salmon fishing. All state residents are eligible to receive a subsistence permit. The fishing schedule listed above will be in effect unless reduced or closed by emergency order because of weaker than expected salmon runs. Dip nets and cast nets are legal gear for harvesting salmon in Norton Sound and are allowed during the set gillnet fishing periods. Beach seining is allowed during set gillnet fishing periods from June 15 through August 15.

Stream-specific harvest limits are listed on the subsistence salmon fishing permits. There are no catch limits in marine waters. Permit catch limits for Nome Subdistrict and Port Clarence District streams are listed in Table 2.

The department will use the Eldorado River weir counts as the primary indicator of chum salmon run strength in Nome Subdistrict east of Cape Nome. If Eldorado River chum salmon escapement begins to lag behind historical run timing curves and indicates the escapement goal range will not be met, marine and river fishing periods may be reduced or suspended until the department switches to management to other salmon species. The Eldorado River chum salmon escapement is expected to be met in 2017 and daily escapement counts from the weir will be used to confirm that the run is tracking as expected. If the escapement goal range is projected to be achieved the department will consider commercial fishing openings east of Cape Nome. Aerial surveys will be used to index escapement to the Flambeau and Bonanza rivers. If aerial survey counts show escapements to be lagging, then freshwater fishing periods in these systems may be suspended.

The department will use the Nome River and Snake River escapement counts as an indicator of chum salmon run strength in the Nome Subdistrict west of Cape Nome. If the Nome River and Snake River weir counts project that the chum salmon escapement goal range will not be reached, marine and freshwater subsistence fishing periods may be restricted or suspended. The Cripple and Penny rivers are closed by regulation to subsistence chum salmon fishing. The Sinuk River is expected to have a good chum and sockeye salmon runs in 2017.

Commercial fishing periods are expected in Nome Subdistrict for chum salmon and possibly pink salmon if there is buyer interest. Also, there is the possibility for commercial fishing for coho salmon in August depending on run strength. Directed fishing periods for chum and coho salmon will have gear restricted to a maximum mesh size of 6 inches and for pink salmon to a maximum mesh size of 4 ½ inches.

## **GOLOVIN SUBDISTRICT**

Low chum salmon runs and a lack of markets kept Subdistrict 2 (Golovin) closed to commercial chum salmon fishing for most of the first decade of the 2000s. Although good commercial chum salmon fishing occurred in 2010 and 2011, runs of chum salmon in 2012 and 2013 were poor, but improve greatly in 2014 and 2015, but were again down in 2016. The chum run is expected

to improve compared to last year with commercial fishing time expected in late-June if run strength comes in as expected

The Niukluk River tower project is no longer operational, but a counting tower project initiated by NSEDC did operate on the Fish River downstream of the confluence of the Niukluk River the last three years. The department plans to use salmon escapement counts from the project this year as an index to compare with other salmon run assessments to determine if commercial fishing time is warranted. If the Fish River project proves to be an accurate assessment over several generations of salmon escapement the department may be able to set a tower-based escapement goal.

If the Fish River project is unable to accurately enumerate the salmon run because of high water, then the chum salmon escapement counts in the adjacent Subdistrict 3 will be used as an indicator of the chum salmon run in Subdistrict 2 along with a peak aerial survey count if possible. By comparing Niukluk River tower chum salmon counts (1995-2012) with Kwiniuk River tower chum salmon counts of the same year there has been agreement between both rivers achieving or not achieving their respective escapement goals in 16 of 18 years. The department will also evaluate catch per unit of effort (CPUE), if there is commercial fishing, with historical commercial fishing periods during similar dates to determine if additional fishing time is warranted. This management method is similar to management before escapement goals were established in 1999 and will be used until future escapement goals are set based on sufficient aerial survey or tower data.

Both the Fish River tower site and the former Niukluk River tower site are much farther upstream than the adjacent Subdistrict 3 counting tower on Kwiniuk River. The department historically has used the counts from Kwiniuk River tower to determine early season chum salmon openings in Subdistrict 2. Further commercial chum salmon fishing opportunity after mid-July will be dependent on sufficient chum salmon escapement determined by an aerial survey count. Also, if the Fish River tower crew is able to effectively count and differentiate salmon species the chum salmon counts will be compared with the former Niukluk River tower escapement goal of 23,000 chum salmon to determine if that goal would have been met. Last decade, a three-year chum salmon tagging study showed an average of one-third of the Fish River drainage escapement was in the Niukluk River.

The pink salmon run should be sufficient to allow for commercial fishing periods in July if there is buyer interest and there will likely be coho salmon commercial fishing periods. Until mid-August coho commercial CPUE will be used to set commercial coho salmon fishing time. By mid-August, if the Fish River counting tower is still operational, the department will determine additional fishing time based on coho salmon escapement as estimated by the counting tower. Also, the department plans to conduct aerial surveys of Niukluk River and Ophir Creek and an aerial survey goal of 750 to 1,600 coho salmon has been established replacing the former Niukluk River counting tower goal of 2,400 to 7,200 coho salmon.

Permits are required when subsistence salmon fishing and no restrictions in subsistence fishing time are expected. In the last decade subsistence harvests of chum salmon have been estimated to be less than 5% of the subdistrict run and the subsistence harvest of coho salmon in the subdistrict has been estimated to be less than 15% of the run for most years.

## **ELIM SUBDISTRICT**

Except for 2014, when hook and line subsistence fishing for Chinook salmon was closed, there have been no other subsistence restrictions in over 25 years in Subdistrict 3 (Elim). Subsistence permits are required when subsistence salmon fishing in the Elim Subdistrict and other than the possibility of in-season Chinook salmon restrictions to achieve the Kwiniuk River tower goal, no other restrictions are expected.

Commercial fishing for chum salmon is expected to begin in late-June and the run is expected to be similar or slightly improved compared to last year. However, last year the chum salmon escapement goal was not reached and if the run is similar to last year then the department would close commercial chum salmon fishing in early July. The pink salmon run is expected to be average for an odd-numbered year. A commercial pink salmon directed fishery can occur if subsistence needs are expected to be met and chum salmon escapement goals are projected to be achieved, or after July 6 if it is determined there is a harvestable surplus of pink salmon and that a directed pink salmon commercial fishery will not have a significant impact on the escapement or subsistence use of chum salmon.

Directed fishing periods for chum and coho salmon will have gear restricted to a maximum mesh size of 6 inches and for pink salmon to a maximum mesh size of 4 ½ inches. Commercial coho salmon openings in 2016 are likely depending on the expected above average run strength.

## **NORTON BAY SUBDISTRICT**

Commercial salmon fishing returned to Subdistrict 4 (Norton Bay) in 2008 after 10 years without a buyer, and commercial fishing has occurred every year since. Previously, salmon markets had not been sufficient to attract interested fishermen or buyers. Inseason escapement monitoring indices for this subdistrict were not available in previous years and the department used information from nearby subdistricts to determine if commercial fishing time was warranted along with historical CPUE comparisons. However, since 2011 NSEDC has operated a counting tower on the Inglutalik River and the department plans to use salmon escapement counts from the project as an index to compare with other projects in 2017. If the project proves to be an accurate assessment over several generations of salmon escapement the department would be able to set tower-based escapement goals.

In the last five years there have been record commercial harvests of pink (2012), chum (2013) and coho (2015) salmon. Commercial salmon fishing harvests are expected to be average in 2017, but restrictions on subsistence fishing time to protect Chinook salmon will likely be needed again.

## **SHAKTOOLIK AND UNALAKLEET SUBDISTRICTS**

Subdistricts 5 (Shaktoolik) and 6 (Unalakleet) have been managed as one fishery because past studies have shown salmon bound for these subdistricts intermingle and that harvests in one subdistrict likely will affect the other. If there is a sufficient salmon surplus for commercial fishing, a fishery will occur, but no commercial fishing is expected for Chinook salmon because of recent poor runs and poor parent-year escapements. Chum and pink salmon will be targeted commercially depending on market interest and gillnet fishing would likely occur after June to allow more time for Chinook salmon to pass through the subdistricts. However, there may be the possibility of commercial fishing with beach seines for chum and pink salmon in June. The

Alaska Board of Fisheries passed a regulation effective this year allowing for commercial beach seining for chum and pink salmon without the restriction of occurring after July 1 if there are Chinook salmon restrictions. The department will switch to coho salmon management in late July and a commercial fishery is expected.

Timing and abundance of the Chinook salmon run will be monitored using passage estimates from the Unalakleet River weir and a counting tower on the North River, an important Chinook salmon spawning tributary in the Unalakleet River drainage. The escapement goal range for the North River is 1,200–2,600 Chinook salmon. However, for a Chinook salmon directed commercial fishery to occur, the department must project an escapement of a minimum of 1,900 Chinook salmon past the North River tower.

To protect Chinook salmon a subsistence fishing schedule is in regulation and begins in mid-June in Subdistricts 5 and 6. The regular subsistence fishing schedule in the marine waters of Shaktoolik and Unalakleet Subdistricts is from 6:00 p.m. Monday until 6:00 p.m. Wednesday and from 6:00 p.m. Thursday until 6:00 p.m. Saturday. The schedule in the Unalakleet River is from 8:00 a.m. Monday until 8:00 p.m. Tuesday and from 8:00 a.m. Friday until 8:00 p.m. Saturday. However, in recent years it has been difficult reaching the North River Chinook salmon escapement goal and the subsistence fishing schedule has been suspended the last three years in order for Chinook salmon escapement goals to be reached. For the first time since 2010, the North River escapement goal range of 1,200 to 2,600 Chinook salmon was reached in 2014 and 2015 with an escapement count of 2,328 and 1,938 fish, respectively. However, in 2016 escapement goal range was likely not reached. A combination of targeted subsistence gillnet fishing closures, mesh size restrictions, closing subsistence fishing in the lower Unalakleet River, and marine water fishing period reductions will likely be needed to reach the escapement goal range in 2017. As in recent years, the department will consider input from fishermen in Shaktoolik and Unalakleet when developing Chinook salmon management strategies for the 2017 season.

Based on the recent 5-year trend in run performance and sibling relationships, the 2017 Chinook salmon run to southern Norton Sound is expected to be similar to 2016 with the possibility of some improvement. As a result, there is the possibility there will be some limited subsistence opportunity to target Chinook salmon. However, more severe conservation measures may be needed in 2017 to reach the escapement goal range. Regardless, the department will allow beach seines and restricted mesh gillnets for periods beginning in late June or early July to provide opportunity for subsistence users to utilize chum and pink salmon during optimal weather periods. Regulations allow beach seines with a maximum mesh size of 4 ½ inches to be used from July 1 through August 10 to harvest salmon other than Chinook salmon. However, the department can allow the use of beach seines earlier by emergency order after factoring in weather and run timing patterns.

Chum and pink salmon directed commercial gillnet fishing periods are expected in July. Because of the expected restrictions to Chinook salmon subsistence fishing, the department plans to prohibit the sale of Chinook salmon during other salmon directed fishing periods. Chum and pink salmon runs are expected to be above average. In Subdistricts 5 and 6, the commercial chum and pink salmon fishery may occur only if it is determined there is a harvestable surplus of chum or pink salmon and that a directed chum or pink salmon commercial fishery will not have a significant impact on escapement or subsistence use of Chinook salmon. If gillnet mesh-size restrictions or subsistence fishing time is restricted in the Chinook salmon subsistence fishery,

commercial chum and pink salmon gillnet fisheries will not occur prior to July 1. However, there is the possibility of beach seine openings targeting chum salmon if there is sufficient run strength and buyer interest. If Chinook salmon escapements are lagging, then other salmon gillnet fisheries will need to be delayed to minimize Chinook salmon harvest. Chum salmon gillnet fishing periods will have gear restricted to a maximum mesh size of 6 inches and pink salmon directed fishing periods will have gear restricted to a maximum mesh size of 4 ½ inches. If there is sufficient run strength, coho salmon commercial fishing openings will continue to occur as they have in recent years. The coho salmon season is considered to begin July 25, or when coho salmon catches exceed chum salmon catches. Coho gear will be restricted to a maximum mesh size of 6 inches and the regular 48-hour periods will be in effect if there are no escapement concerns.

Shaktoolik Subdistrict directed chum and coho salmon fisheries may be managed somewhat differently. Recurring high surf conditions over the past several seasons have severely limited commercial fishing time in this subdistrict. Whereas Unalakleet Subdistrict permit holders are often able to fish two 48-hour commercial fishing periods a week, the department may have a 72-hour commercial fishing period in Shaktoolik if weather prevents permit holders for setting gear for extended periods of time. This strategy should help maintain interest in the fishery and lead to safer fishing conditions and improved quality of fish delivered to buyers. Additionally, severe weather conditions affecting fishing should also allow sufficient numbers of chum and coho salmon to enter the Shaktoolik and Unalakleet rivers for escapement and subsistence needs. Changes to the fishing schedule from previous years may occur depending on the buyer requesting a change based on capacity limits and quality issues.

## **ST. MICHAEL AND STEBBINS**

Subsistence fishing is open 7 days per week in southern Norton Sound from Pt. Romanof to the Subdistrict 6 boundary. A new regulation passed by the Alaska Board of Fisheries allows for the restriction of gillnet mesh size in the subsistence fisheries throughout Norton Sound. The department is projecting weak runs of Chinook salmon in the Yukon River and southern Norton Sound (Shaktoolik and Unalakleet rivers) in 2017 and there will likely be no commercial Chinook salmon fishing in either management area. Conservation measures will be required to meet escapement goals in these rivers. In order to conserve Chinook salmon for spawning escapement and future uses by fishermen, it may be necessary to consider reducing harvest of Chinook salmon migrating through the St. Michael and Stebbins areas by having closures or gillnet mesh size restrictions in the subsistence fishery.

## **PORT CLARENCE DISTRICT**

The sockeye salmon run is not expected to reach the inriver goal of 30,000 fish in Pilgrim River and therefore a commercial fishery targeting sockeye salmon would not occur. If the inriver goal is projected to be reached a commercial fishing is possible if there is buyer interest.

Subsistence salmon fishing permits are required for the Port Clarence District, Pilgrim River drainage and Salmon Lake. Catch limits are listed on subsistence permits and in Table 2.

The sockeye salmon run in the Pilgrim River crashed in 2009 with only 953 fish through the weir after the previous 6 years had record passage from 20,000 to 85,000 sockeye salmon. The sockeye salmon escapement was only 1,654 fish in 2010. However, the escapement goal range of 4,000 to 8,000 sockeye salmon in Salmon Lake, observed by aerial survey, was achieved the last

six years. Based on the well above average sockeye salmon run in 2015 and 2016 the department expects 2017 to have a well above average run again. The department will compare the 2017 sockeye salmon run with historical escapement counts at the Pilgrim River weir after the first week of July and decide if a change is warranted in subsistence catch limit or if a closure may be necessary to reach the escapement goal range. No other subsistence fishing closures are expected in Port Clarence District.

## **TABLES AND FIGURES**

Table 1.–Commercial salmon catches by species, Norton Sound District, 1961–2016.

Year	Chinook	Sockeye	Coho	Pink	Chum	Total
1961	5,300	35	13,807	34,327	48,332	101,801
1962	7,286	18	9,156	33,187	182,784	232,431
1963	6,613	71	16,765	55,625	154,789	233,863
1964	2,018	126	98	13,567	148,862	164,671
1965	1,449	30	2,030	220	36,795	40,524

2015	1,288	4,199	153,929	62,888	147,493	369,801
2016	324	2,888	102,890	208,961	51,176	366,239
Average 2011-2015	422	1,094	83,292	93,254	109,456	287,517
Average 2006-2015	246	576	94,283	59,449	75,674	230,228

*Note:* Harvest numbers may include a small number of salmon retained for personal use reported on fish tickets that were not commercially sold.

<sup>a</sup> All Chinook salmon caught were not sold, but were retained for personal use.

Table 2.–Norton Sound and Port Clarence Districts annual subsistence salmon permit limits.

---

Norton Sound District - Nome Subdistrict

Cripple River	No chum catch allowed
Penny River	No chum catch allowed
Nome River	100 coho/household
Snake River	100 coho/household
Solomon River	40 chum/household and 20 coho/household

Port Clarence District

Pilgrim River	3 king/household and 25 sockeye/household
Salmon Lake	Open by emergency order only; 200 sockeye salmon/household

---

*Note:* The waters of the Nome Subdistrict are subject to closures from June 15 to September 30. The Port Clarence District is outside the Nome Subdistrict area and, therefore, subsistence fishing can occur 7 days a week unless closed by an emergency order.
