#### 2023

#### ANNUAL MANAGEMENT PLAN

#### **KITOI BAY HATCHERY**

#### Kodiak Regional Aquaculture Association

This Annual Management Plan (AMP) plan is prepared to fulfill the requirements of 5 AAC 40.840. This plan must organize and guide the hatchery's operations, for each calendar year, regarding production goals, broodstock development, and harvest management of hatchery returns. Egg take through release details are included in planning for succeeding calendar years. Inseason assessments and project alterations by Kodiak Regional Aquaculture Association (KRAA) or Alaska Department of Fish and Game (ADF&G) may result in changes to this AMP in order to reach or maintain program objectives. KRAA will notify the ADF&G private nonprofit (PNP) hatchery program coordinator in a timely manner of any departure from the AMP. The ADF&G PNP coordinator will advise as to whether an amendment, exception report, or other action is warranted. No variation or deviation will be implemented until an AMP amendment has been approved or waived by both the department and KRAA. This policy applies to all hatchery operations covered under the AMP.

#### **INTRODUCTION**

The Kitoi Bay Hatchery (KBH) is located on Afognak Island (58°11.04'N lat., 152°21.04'W long.) on the west side of Izhut Bay approximately 48 km (30 miles) north of the city of Kodiak (Appendix A1). The hatchery infrastructure was constructed in 1954 by the U.S. Department of the Interior, Fish and Wildlife Service (USFWS), but was destroyed in the 1964 earthquake and rebuilt by the Alaska Department of Fish and Game (ADF&G) in 1965.

Funding for the hatchery was provided exclusively by ADF&G prior to state fiscal year 1987 (FY87) and was provided jointly by ADF&G and Kodiak Regional Aquaculture Association (KRAA) from FY87 to FY91. The hatchery has been fully funded by KRAA since FY92. KBH is owned by the State of Alaska and KRAA operates the facility under an agreement with the State of Alaska. The hatchery is operated in accordance with AS 16.10.400–480, the *KBH Basic Management Plan* (BMP), *KBH Annual Management Plan* (AMP), private nonprofit (PNP) hatchery permit #29, and further delineated by fish transport permits

The hatchery was initially designed as a sockeye salmon (*Oncorhynchus nerka*) research facility. By 1976, hatchery production priorities switched to pink salmon (*O. gorbuscha*) fisheries enhancement. The present goal of the facility is to provide enhanced common property salmon fishing opportunities for Kodiak Management Area (KMA) fishermen by increasing returns of pink, chum (*O. keta*), coho (*O. kisutch*), and sockeye salmon through broodstock development, egg takes, incubation, hatching, rearing and releasing juvenile salmon, primarily to the Kitoi Bay area. KBH primarily increases salmon harvest of KMA

commercial fisheries. Secondary user groups (in terms of the number of salmon harvested) of hatchery production include subsistence and sport fishermen. KBH has the capacity to produce 230 million juveniles of all life stages (fry, fingerling, presmolt, and smolt).

The purpose of this AMP is to describe the proposed stocking, rearing, and egg-take activities to be undertaken by KBH in 2023, anticipated 2023 salmon returns resulting from KBH projects, and management of KBH salmon in Kodiak waters. Appendix A contains maps showing the KMA and the location of KBH and various projects. Appendix B contains KBH salmon production records. Appendix C shows data and methodology used for return and harvest estimates, and Appendix D cites all relevant KBH fish transport permits (FTP).

## 1.0 OPERATIONAL PLANS FOR 2023

#### 1.1 Egg-take Limits and Broodstock Sources

PNP salmon hatchery permit number 29, approved permit alterations, and the KBH BMP specify the maximum green egg capacity and broodstock by species. Hatchery release sites are similarly authorized and projects are further delimited by fish transport permits (FTPs).

Species	Permitted	Donor Stock /	Egg-Take	Release Site
Chum salmon	36.000.000	Kitoi Bay H /	36 000 000	Kitoj Bay
	50,000,000	Sturgeon River	30,000,000	Kitol Day
Pink salmon	215,000,000	Kitoi Bay H / Kitoi	215,000,000	Kitoi Bay
		Bay		
Coho salmon	2,300,000	Kitoi Bay H/ L	1,800,000	Kitoi Bay
		Kitoi Lk <sup>a</sup>		
		Kitoi Bay H / L	190,000	Crescent Lake
		Kitoi Lk <sup>a</sup>		
		Kitoi Bay H / L	230,000	Jennifer Lake
		Kitoi Lk <sup>a</sup>		
		Kitoi Bay H / L	40,000	Katmai Lake
		Kitoi Lk <sup>a</sup>		
		Kitoi Bay H / L	40,000	Ruth Lake
		Kitoi Lk <sup>a</sup>		
Sockeye salmon	850,000	Little Kitoi Lake /	850,000	Little Kitoi Lake
		Saltery Lake <sup>b</sup>		
	100,000	Little Kitoi Lake /		Ouzinkie
		Saltery Lake <sup>b</sup>		

<sup>a</sup>Starting with brood year 2013 and every third year after that (2019, 2022, 2025...), the ancestral stock of coho returns to KBH is Little Kitoi Lake and Buskin River combined.

<sup>b</sup>Saltery Lake is ancestral stock for Little Kitoi Lake sockeye and is permitted as a backup brood source. Note: Maximum numbers are specific to release site; in combination may not exceed permitted capacity.

## 1.2 Capture, Egg Take, Transport, and Carcass Disposal Plans 1.2.1 Chum Salmon: Big Kitoi Creek

Approximately 50,000 returning adult KBH chum salmon will be needed for broodstock to achieve the egg-take goal of 36 million eggs. Adults will be collected and contained behind a barrier seine prior to ascending the fish ladder to the broodstock raceways where the eggs are collected. KBH will use the dry spawning method and water harden eggs in an iodophor solution for one hour prior to loading into incubators. No Big Kitoi Creek (BKC) chum salmon gametes will be transferred to any other location. Chum salmon egg collection normally occurs between July 15<sup>th</sup> and August 1<sup>st</sup>. Chum salmon carcasses will be disposed of in Outer Kitoi Bay and are documented on the KRAA Salmon Hatchery Carcass Disposal Log.

## 1.2.2 Pink Salmon: Big Kitoi Creek

Approximately 425,000 returning adult KBH pink salmon will be needed for broodstock to achieve the egg-take goal of 215 million eggs. Adults will be collected and contained behind a barrier seine prior to ascending the lower section of the fish ladder where the eggs are collected. KBH will use the dry spawning method before loading eggs into incubators. No BKC pink salmon gametes will be transferred to any other location. Pink salmon egg collection normally occurs between September 1<sup>st</sup> and the 21<sup>st</sup>. Pink salmon carcasses may be disposed of in Outer Kitoi Bay and will be documented on the KRAA Salmon Hatchery Carcass Disposal Log, or they may be sold to processors.

# 1.2.3 Coho Salmon: Big Kitoi Creek

Approximately 6,000 returning adult KBH coho salmon will be needed for broodstock to achieve the egg-take goal of 2.3 million eggs. Coho salmon eggs will be collected for future releases into Big Kitoi Bay, Jennifer, Ruth, Crescent, and Katmai lakes. Adults will be collected and contained behind a barrier seine prior to ascending the fish ladder to the broodstock raceways where the eggs will be collected. KBH will use the dry spawning method and water harden eggs in an iodophor solution for one hour prior to loading into incubators. No BKC coho salmon gametes will be transferred to any other location. Coho salmon egg collection normally occurs on November 1<sup>st</sup>. Coho salmon carcasses will be disposed of in Outer Kitoi Bay and documented on the KRAA Salmon Hatchery Carcass Disposal Log.

#### 1.2.4 Sockeye Salmon: Little Kitoi Lake

Approximately 1,200 adult sockeye salmon returning to Little Kitoi Lake (LKL) will be used for broodstock to achieve the egg-take goal of 850,000 eggs. Sockeye salmon adults will be collected by seining in LKL during the first week of September. Broodstock will be held in 20' x 20' net pens in LKL for about two weeks prior to egg collection. Standard sockeye salmon egg-take procedures will be used during egg take and eggs will be water hardened in an iodophor solution for one hour prior to transfer back to KBH for incubation. Sockeye salmon gametes will be transferred from LKL to KBH for incubation, rearing, and release back into LKL, but none will be transferred to any other location. Egg collection normally occurs between September 14<sup>th</sup> and the 21<sup>st</sup>. Brood use for these egg takes will be documented in the KRAA Salmon Hatchery Carcass Disposal Log.

#### **1.3 Incubation Plans**

#### 1.3.1 Chum Salmon

Chum salmon eggs will be incubated in the main hatchery building in two types of NOPAD incubators supplied with ultraviolet (UV)-treated water. Kitoi NOPADs will be loaded at 420,000 green eggs and 235,000 eyed eggs. Regular NOPAD incubators will be loaded at 336,000 green eggs and 200,000 eyed eggs. Fry generally emerge from incubators between the second week in January and the first week in March. All chum salmon fry will be non-volitionally ponded from these incubators through a high-density polyethylene (HDPE) line, directly to saltwater net pens. Approximately 30 million brood year 2022 (BY22) chum salmon juveniles are currently incubating at KBH for release in 2023.

#### 1.3.2 Pink Salmon

Pink salmon eggs will be incubated in the main and expansion hatchery buildings in Kitoi NOPADs, regular NOPADs, and Kitoi box incubators. Kitoi NOPADs will be loaded at 500,000 green eggs and 350,000 eyed eggs. Regular NOPADs will not be loaded with green eggs, but will be loaded with 304,000 eyed eggs. Kitoi box incubators will be loaded at 825,000 green eggs at egg take and at 430,000 eyed eggs after pick. Fry generally emerge from incubators during the third week in March. All fry in Kitoi Box incubators will move volitionally to saltwater net pens through polyvinyl chloride (PVC) piping and will be enumerated with electronic fry counters. This represents about 44% of the number of juveniles, or about 87 million fry. The remaining 56% of pink salmon fry, or about 109 million juveniles, will move non-volitionally through a separate HDPE outmigration line to saltwater net pens. Approximately 196 million BY22 pink salmon juveniles are currently incubating at KBH for release in 2023.

#### 1.3.3 Coho Salmon

Coho salmon eggs will be incubated in Kitoi box, NOPAD, and Heath tray incubators located in the Coho Annex. The annex is an isolated incubation room attached to the Main Hatchery Building. Coho salmon NOPAD Incubators are partitioned for single family tracking for BKD and will be loaded at 60,000 to 180,000 green eggs at egg take. Heath tray incubators are partitioned for single family tracking and will be loaded at 126,000 green eggs per stack. After single family tracking is complete, Kitoi Boxes will be loaded at 280,000 eyed eggs. Fry generally emerge from incubators between the third week in May and the first week in June. All fry will move volitionally from incubators, through PVC piping, to a collection trough where they are enumerated and ponded into raceways. Approximately 2.3 million BY22 coho salmon eggs are currently incubating at KBH for release in 2023 and 2024.

#### 1.3.4 Sockeye Salmon

Sockeye salmon eggs will be incubated at KBH in Kitoi box incubators in an isolated room supplied with UV-treated water. The eggs will be disinfected prior to loading into the incubators. Incubators will be loaded at approximately 125,000 green eggs each. Fry generally emerge from incubators between the second week of May and the last week in May. Fry will emerge volitionally from incubators into start tanks which are placed adjacent to the incubators and then will be transferred to raceways supplied with UV-treated water. Approximately 707,000 BY22 sockeye salmon eggs are currently incubating at KBH for release in 2024.

## 1.4 Rearing and Release Plans

## 1.4.1 Chum Salmon

Approximately 30 million BY22 chum salmon fry will be reared in net pens and released between 2.0 and 4.0 grams (g) within the Inner Kitoi Bay Section between May 6 and June 1 (Appendix B1). Fry will be reared in saltwater net pens for approximately 10 to 16 weeks. Fry will be released in two separate groups; one half of the juveniles (otolith marked 3n,3n,3H) will be released between May 6 and May 18 and the second group (marked 3,1,3H) will be released two weeks later. The late release group will be split into empty pens that result from the first release.

## 1.4.2 Pink Salmon

Approximately 196 million BY22 pink salmon fry (marked 2,3H) will be reared in net pens and released at 0.8 g within the Inner Kitoi Bay Section between May 6 and May 30 (Appendix B2). The fry will be reared in saltwater net pens for approximately 3 to 9 weeks.

#### 1.4.3 Coho Salmon

Approximately 536,000 BY21 coho salmon smolt (marked 3,4H) will be reared in net pens and released at 20.0 g within the Inner Kitoi Bay Section between June 3 and June 17 (Appendix B3).

Approximately 2.0 million BY22 coho salmon fry will be ponded in June and reared at KBH for release to several different locations. After results of single family tracking are received, all eggs from hens with mean optical density values >0.2 will be culled and discarded.. KBH plans to release 40,000 coho salmon fry (marked 3,4H) into Ruth Lake, 230,000 fry (marked 3,4H) into Upper and Lower Jennifer Lakes, and 190,000 fry (marked 3,4H) into Crescent Lake around the middle of July 2023. An additional 40,000 presmolt (marked 3,4H) will be released into Katmai Lake around the beginning of October 2023. Approximately 1.45 million fry will be retained at KBH for rearing and eventual release within the Inner Kitoi Bay Section as 20.0 g smolt (marked 3,4H) in June of 2023.

#### 1.4.4 Sockeye Salmon

Approximately 456,000 BY21 Saltery Lake sockeye salmon smolt (marked 6,3H) will be reared in net pens in LKL and released at 24.0 g into the Little Kitoi Estuary (LKE) in the first week of June (Appendix B4). The fish will be transported to LKL in an oxygenated transfer tank and pumped into net pens in the lake for approximately three to five weeks of rearing and imprinting. Smolt will then be siphoned from net pens to the estuary at release, which will occur at the beginning of June during the peak outmigration of the resident sockeye salmon smolt.

Approximately 50,000 BY21 Saltery Lake sockeye salmon smolt (marked 6,3H) will be transferred to Ouzinkie Boat Harbor (OBH) for imprinting and release. The fish will be transported to OBH in an oxygenated transfer tank and pumped into net pens in the harbor for approximately three to four weeks of rearing and imprinting. Release will occur around the first week of June at approximately 24.0 grams per fish.

Approximately 707,000 BY22 Saltery Lake sockeye salmon eggs are currently incubating at KBH and will be released into LKE and OBH in 2024. Approximately 650,000 to 700,000 smolt (LKL) and 0 to 50,000 smolt (OBH) will be transferred for short-term net pen rearing and imprinting prior to being released in the spring of 2024.

## 2.0 WILD DONOR STOCK MANAGEMENT

There are no plans or expectations to use naturally-spawning salmon stocks as donor stocks for KBH broodstock and egg takes. If sockeye salmon returns to Little Kitoi Lake are too low to provide the broodstock needed to meet the egg take goal, then a backup egg take may occur at Saltery Lake. Saltery Lake is a primary egg take site for late-run sockeye at Pillar Creek Hatchery. See the Pillar Creek Hatchery Annual Management Plan for Saltery Lake egg take plans.

Management of KBH salmon stocks is detailed in the *Hatchery Return Management* section below.

#### 2.1 Common Property Fisheries

Not applicable.

#### **2.2 Escapement Requirements**

Not Applicable.

#### **2.3 Donor Stock Collection Procedures**

Not Applicable.

#### **3.0 HATCHERY RETURN MANAGEMENT**

Management of salmon harvested by subsistence and commercial fishermen will be conducted by the ADF&G Division of Commercial Fisheries through permitting, preseason development of regulatory management plans and annual harvest strategies, inseason management actions by emergency order (EO) establishing fishing time and area (within guidelines in management plans) based on harvest strategies and inseason salmon escapements and/or other conservation considerations.

Harvest of salmon by sport anglers and personal use fishermen is managed by the ADF&G Division of Sport Fish in accordance with regulations as provided in 5 AAC 47 - 5 AAC 75. Emergency orders may be issued to liberalize or restrict sport fisheries based on achievement of broodstock goals.

KRAA staff work closely with the Kodiak ADF&G commercial and sport fisheries area management biologists (AMBs) to assure that they have information that KRAA can provide to manage the associated fisheries. KRAA is involved in cooperative projects with ADF&G and assists in the management of natural stocks by providing funding and personnel to gather data necessary for sustainable management of Kodiak salmon populations. Further, KRAA staff share openly with ADF&G salmon management staff any inseason observations on salmon runs or fishery issues.

KBH is a remote facility located on the east side of Afognak Island (Appendix A1) and KBH-released salmon return to waters adjacent to the hatchery. The Kitoi Bay commercial fishery harvest strategy is described in the *Eastside Afognak Management Plan* (5 AAC 18.365) and is designed to increase fishing opportunities for the commercial salmon fishery in the Duck, Izhut, and the Inner and Outer Kitoi bay sections (Appendix A2), while providing for adequate returns to KBH.

Inseason management of KBH salmon runs is complex, with overlapping run timing between species and multispecies broodstock priorities. The ADF&G Kodiak commercial fishery salmon AMB will open and close the Duck, Izhut, and Inner and Outer Kitoi bay sections adjacent to KBH as needed to harvest hatchery salmon returns in common property or cost-recovery fisheries. During broodstock collection periods, adjustments to fishing periods in KBH management units will be necessary. Communication between the Kodiak salmon fisheries AMB and the Kitoi Bay hatchery manager is essential to secure broodstock to achieve egg-take goals while maintaining harvests on high quality hatchery returns.

# 3.1 Hatchery Return Projections

#### 3.1.1 Chum Salmon

The midpoint estimate for adult chum salmon returning to KBH in 2023 is 109,000 (range 87,000 to 131,000), assuming a 0.80% marine survival (Appendix C1) from the 2020 fry release of 18.2 million. (74% 0.3)

#### 3.1.2 Pink Salmon

The midpoint estimate for adult pink salmon returning to KBH in 2023 is 5.7 million (range 4.3 million to 7.1 million), assuming a 2.9% marine survival (Appendix C1) from the 2022 fry release of 196.4 million.

## **3.1.3 Coho Salmon**

The midpoint estimate for adult coho salmon returning to KBH in 2023 is 132,000 (range 106,000 to 159,000), assuming a 9.6% marine survival (Appendix C1) from the 2022 smolt release of 1.4 million.

#### 3.1.4 Sockeye Salmon

The midpoint estimate for adult sockeye salmon returning to LKL in 2023 is 10,750 (range 8,600 to 12,900), based on poor recent brood year survivals of around 2.5% to 3% (Appendix C1). Additionally, there were no juvenile BY19 sockeye salmon released from the hatchery in 2021. As a result, the returning 3-ocean age class will be missing in 2023 which historically makes up 66% of the Kitoi Bay sockeye salmon run.

## 3.2 Returns to Common Property Fisheries

#### 3.2.1 Chum Salmon

Chum salmon are produced for harvest by the common property fishery. The anticipated 2023 KBH chum salmon run is 109,000 fish. About 50,000 adults will be needed for broodstock. Additionally, BKC chum salmon escapement will be monitored by KBH staff with an annual escapement objective of 2,000 adults. An estimated 57,000 chum salmon will be available for common property harvest.

Chum salmon produced at KBH are taken in the commercial common property fishery in the Duck, Izhut, and Kitoi bay sections. The chum salmon run begins in early June, peaks in late June to early July, and ends in late July. The initial KBH chum salmon commercial fishery opening is expected to occur on June 9, 2023, but may occur as early as June 1, 2023. Portions of the Inner and Outer Kitoi, Izhut, and Duck bay sections are expected to close for broodstock collection around June 30, 2023.

#### 3.2.2 Pink Salmon

Pink salmon are produced for the common property fishery, as well as for cost recovery. The anticipated 2023 KBH pink salmon return is 5.7 million fish. Approximately 425,000 pink salmon adults will be needed for broodstock. The 2023 cost recovery harvest goal determined by the KRAA board of directors is 3.0 million lbs. Broodstock collection will be prioritized above cost recovery. Additionally, BKC pink salmon escapement will be monitored by KBH staff, with an annual escapement objective of 15,000 adults.

Pink salmon produced at KBH will be harvested in the commercial fishery in the Duck, Izhut, and Kitoi bay sections. The Kitoi Bay pink salmon return begins in mid-July,

peaks in early to mid-August, and ends in late August to early September. The initial fishery opening for pink salmon is anticipated to occur on July 6, 2023 and is designed to assess run strength and timing and to harvest excess males, which arrive during the early portion of the run. Traditionally, portions of the Inner and Outer Kitoi, Izhut, and Duck bay sections could close to commercial common property fishing for cost-recovery operations around August 1.

The number of pink salmon available for the common property fishery will depend on a combination of marine survival, average adult fish weight, and KRAA's cost recovery harvest needs. In addition, once cost recovery operations are complete, portions of the Duck, Izhut, and Kitoi bay sections could close for pink salmon broodstock collection.

#### 3.2.3 Coho Salmon

The anticipated 2023 KBH coho salmon return is 132,000 fish. About 6,000 adult coho salmon are required for broodstock. Approximately 126,000 coho salmon will be available for common property harvest.

Coho salmon produced at KBH will be harvested in the commercial common property fishery in the Duck, Izhut, and Kitoi bay sections. The coho salmon run is expected to start in early August, peak in late August, and continue through early September. KBH coho salmon will be harvested incidental to the pink salmon fishery in the Duck, Izhut, and Kitoi bay sections as well as in directed coho salmon fisheries in late August and early September. After August 24, fishing time in some of these sections will depend on the abundance of local and hatchery coho salmon. Coho salmon returning to Jennifer and Ruth lakes will also be harvested during these commercial fisheries.

#### 3.2.4 Sockeye Salmon

The anticipated 2023 KBH sockeye salmon return is 10,000 fish. About 1,200 adult sockeye salmon are required for broodstock. Sockeye salmon broodstock will be collected in LKL following a desired escapement of 7,000 into the system. When maturing adults aggregate in the lake, they will be captured by beach seine and sorted by sex into floating net pens where they are held until ready for egg collection. Approximately 3,000 sockeye salmon will be available for common property harvest.

Sockeye salmon produced at LKL will be harvested in the commercial common property fishery in the Duck, Izhut, and Kitoi bay sections. However, a portion of the LKL sockeye run will also be harvested incidentally in the cost recovery program. The sockeye salmon run should begin in late June and continue through late August with the peak occurring during the last two weeks of July.

### 4.0 EVALUATION/SPECIAL STUDIES

#### 4.1 Marking and Tagging Programs

#### 4.1.1 Chum salmon

All chum salmon juveniles are thermal marked using differential water sources from Big Kitoi Lake (deep and shallow). Two different marks were given for BY22 chum salmon: 3n,3n,3H for the regular release group, and 3,1,3H for the late release group which will be released approximately two weeks after the regular release group.

#### 4.1.2 Pink Salmon

There is no marking requirement for pink salmon releases from KBH. However, a 2,3H saltwater mark was applied to all BY22 pink salmon.

#### 4.1.3 Coho Salmon

There is no marking requirement for coho salmon releases from KBH. However, a 2,2,2H dry mark will be applied to all BY22 coho salmon eggs.

#### 4.1.4 Sockeye Salmon

All sockeye salmon eggs are dry marked. Approximately 90,000 BY22 sockeye salmon eggs received a 4,2H dry mark and the remaining eggs received a 3,2H dry mark.

#### 4.2 Evaluation

#### 4.2.1 Chum Salmon

Chum salmon scales and otoliths will be collected in the common property fishery and from broodstock returning to hatchery raceways during egg take to determine the age composition of the returning adults. The data is used for determining survivals and forecasting.

Chum salmon returns will be evaluated for the success of the two different rearing strategies by collecting otoliths and evaluating differential thermal marks. Otoliths will be collected during scale collections in the common property fishery, from broodstock, and from Kodiak processors.

#### 4.2.2 Pink Salmon

Adult pink salmon will be sampled throughout cost-recovery operations to gather information on average weight, sex ratio, average quality, and species composition of fish sold. Otolith samples will be collected during cost recovery harvest and from broodstock during egg-take operations. Otoliths will be analyzed to determine the efficacy of KRAA's saltwater marking program. All of the BY21 pink salmon released in 2022 were marked with a 2,3H saltwater mark.

#### 4.2.3 Coho Salmon

Coho smolt are evaluated for osmoregulation capability each spring prior to the transfer of the entire juvenile population to salt water. Sequential test groups of 100 smolt will be held in saltwater test pens for up to one week starting around the middle of April. Once 100% survival is observed, the remaining smolt will be transferred to saltwater net pens. Additionally, otoliths may be collected from broodstock during egg take to evaluate the dry marking program.

#### 4.2.4 Sockeye Salmon

Sockeye salmon scales and otoliths will be collected in the Kitoi Bay sport fishery and from sockeye salmon returning to hatchery raceways during chum salmon egg take to determine the age composition of the returning adults. In 2023, scales may also be collected from sockeye salmon adults entering Little Kitoi Lake. The data is used for determining survivals and forecasting.

Emigrating sockeye salmon smolt will be enumerated from Little Kitoi Lake. The data is used to aid in forecasting. In 2023, age, weight and length data will be collected from the emigrating smolt. Data will be used to reconstruct brood tables and to provide condition factor for fish rearing in the lake.

# 5.0 Approval

Recommendation for Approval: Kitoi Hatchery Annual Management Plan, 2023

Tina Fairbanks: Executive Director, KRAA	4/20/2023
Tyler Polum: Area Management Biologist, Division of Sport Fish	4/20/2023
James Jackson: Area Management Biologist, Division of Commercial Fisheries	4/20/2023
Jason Dye: Regional Supervisor, Division of Sport Fish	4/25/2023
Nicholas Sagalkin: Regional Supervisor, Division of Commercial Fisheries	4/20/2023
Kevin Schaberg: Regional Research Biologist, Division of Commercial Fisheries	4/20/2023
Lorraine Vercessi: PNP Hatchery Program Coordinator, Division of Commercial Fisheries	5/15/2023
Approval:	
The 2023 Kitoi Bay Hatchery Management Plan is hereby approved:	
Tom Taube: Deputy Director, Division of Sport Fish	5/17/2023
Forrest Bowers: Operations Manager, Division of Commercial Fisheries	5/17/2023

Appendix B1.-Kitoi Bay Hatchery chum salmon release and return history, 1982-2022.

<sup>a</sup>Big Kitoi Creek broodstock. Juveniles (fry life stage) were released into Big Kitoi Bay net pens for rearing then released into Big Kitoi Bay. <sup>b</sup>Total reflects returns of all age classes (0.5 age class not shown).

Appendix B4.-Continued

<sup>a</sup>This release resulted from a dissolved oxygen crash in the transfer tanks. <sup>b</sup>Little Kitoi Lake net pen releases.

Note: There were no sockeye salmon eggs collected in 2019, therefore no smolt were released in 2021.

# APPENDIX C. ASSUMPTIONS FOR RETURN ESTIMATES

	Stocking		Survival	Age-at-return Proportions (%) <sup>a</sup>												
		Life	Size	Stocking-to-												
Species	Year S	Stage <sup>a</sup>	(g)	adult return	0.1	0.2	1.1	0.3	1.2	2.1	0.4	1.3	2.2	0.5	2.3	
Pink	even	F	0.90	4.04%												
	odd	F	0.95	2.91%	100											
Chum	all	F	2.92	0.80%		12.89		74.01			13.03			0.08		
Coho	all	FG	1.05	2.0%			100									
Coho	all	S	13.7	9.6%			100									
Sockeye*	all	FPS	0	2.5%			2.7		66.2			25.3	3.1		2.7	
Sockeye	all	SPS	0	2.5%			2.7		66.2			25.3	3.1		2.7	

Appendix C1. – Salmon survival and age assumptions used to estimate 2023 returns for Kitoi Bay Hatchery.

<sup>a</sup> F = Fry, FG = fingerling, FPS = fall presmolt, S = smolt, and SPS = spring presmolt

Pink salmon marine survival for odd and even years above are a two-year average specific to the four-year cyclical return percentage used for specific years.

Chum salmon marine survival is an average based on adult scale data and historic return age structure (BY03, BY11, BY15).

Coho salmon fingerling and fall presmolt survival rates are estimates

Coho salmon smolt marine survival is based on a four-year parent class average (BY08, BY11, BY14, BY17) Sockeye salmon returns to the hatchery will not include a 1.2 age class in 2023 because no BY19 sockeye salmon were released.

		Forecasted Return			Broodstock	Minimum	Cost	Potential
Return Location	Species	Point	Low	High	Required	Escapement <sup>a</sup>	Recovery <sup>b</sup>	Harvest
Kitoi Bay Hatchery	Pink	5,724,000	4,293,000	7,155,000	425,000	15,000	938,000	4,346,000
(Big Kitoi Creek)	Chum	136,000	109,000	185,000	50,000	2,000	0	94,358
	Coho	133,000	106,000	159,000	6,000	0	0	154,000
Little Kitoi Lake	Sockeye	10,750	8,600	12,900	0	7,000	0	3,700
Ouzinkie Harbor	Sockeye	500	400	600	0	0	0	500
Katmai Lake	Coho	700	560	830	0	0	0	700

**Appendix C2.** – Forecasted runs, broodstock requirements, minimum escapements, cost recovery needs, and potential harvest of salmon returning to systems in 2023 as a result of prior Kitoi Bay Hatchery releases.

<sup>a</sup> Minimum escapement for BKC refers to the number of adults remaining in the creek after KBH has completed the egg takes. These fish are allowed entry into the creek to spawn to continue the run in the event of the loss of the hatchery rearing fish.

<sup>b</sup> cost recovery based on 3.0 million lbs.

<sup>c</sup> Potential harvest is the return point estimate minus broodstock, escapement, and cost recovery needs.

# **APPENDIX D. FISH TRANSPORT PERMITS**

Appendix D1.–Kitoi Bay Hatchery current fish transport permits (FTPs).

		Ancestral		Expiration
FTP#	Species	Stock	Description*	Date
22A-0003	Chum	Sturgeon River	36M egg take at KBH, release Kitoi Bay	12/31/2026
