# **General Management Plan for Stocked Fisheries in Region III**

## **INTRODUCTION**

The goal of Region III's Stocked Fisheries Program is to provide diverse and dependable angling opportunities that are also attractive alternatives to the harvest of wild fish stocks. The program supports consumptive fisheries and creates new angling opportunities near population centers and along the road system where potential fishing effort is greatest. It also supports rural and remote fisheries that are typically less crowded and have fish populations with a greater proportion of large fish. As a conservation tool, it serves to divert fishing pressure away from wild populations that cannot support high levels of harvest desired by anglers. Anglers and businesses in the Tanana Valley value the Stocked Fisheries Program because it provides angling opportunities that normally would not be present and it benefits local economies through the sales of fishing related sporting goods and guiding services. Anglers particularly enjoy year-round sport fishing opportunities and catching highly desired species such as rainbow trout and Arctic char that are not native to the Tanana Valley.

In 2009, the Region III Sport Fish Division developed a management plan for stocked fisheries (Swanton and Taube 2009) and the plan was adopted by the BOF for each of the six management areas within Region III<sup>1</sup>. The plan provides Alaska Department of Fish and Game (ADF&G) and Board of Fisheries (BOF) a framework to manage the stocked fisheries program in accordance with the kind of sport angling opportunity desired by the public and provides the background to develop more detailed fishery specific objectives. The plan consists of three categories of stocked fisheries: Regional Management, Conservative Management, and Special Management. In addition, water bodies are further stratified into 4 Sub-Categories (Large, Urban, Rural, and Remote) based on lake size, angler participation, ease of access, and proximity to major population centers. This classification system, combined with public input and hatchery production, determines the stocking schedule used by ADF&G. To accommodate public demand for new and more diverse angling opportunities, there are provisions for adding *New Water Bodies and Moving Water Bodies to a Different Category*.

In 2018, there are 116 lakes in the stocked fisheries program. The actual number fluctuates year to year as lakes are added to or removed from the program. Most lakes are along, or easily accessed from, the highway system. Presently, in the Stocked Fisheries Program there are 91 lakes within the Tanana River Management Area (41 in Delta and 50 in Fairbanks) and 25 lakes within the Upper Copper/Upper Susitna Management Area (Glennallen). Overall, in the regional management category there are 113 lakes, 3 lakes in the conservative management category, and no lakes in the special management category. Within the regional management category there are 5 large lakes (Birch, Chena, Harding, Quartz, and Silver) and 21 urban, 73 rural, and 17 remote lakes.

## MANAGEMENT CATEGORIES

### REGIONAL MANAGEMENT LAKES

**Description:** The majority of stocked fisheries in Region III (97%) are in this category because most anglers generally want to harvest a large portion of their catch. These fisheries are open all year and have liberal bag limits and minimal restrictions. While most of the stocked fisheries are along or near the road system where the potential fishing effort is greatest, others are more remote and typically less crowded due to additional effort required for access. More remote stocked fisheries usually have fish populations with greater proportions of large fish.

**Fishery Management Objective:** To create and maintain a fishery that provides for a reasonable expectation of catching the daily bag limit within a day's angling.

**Bag Limit:** 10 fish (all species combined).

**Length Limit:** Only 1 fish (any species) 18 inches or longer.

**Gear Restrictions:** None.

**Season:** Open all year unless specified.

### CONSERVATIVE MANAGEMENT LAKES

**Description:** Stocked fisheries are managed to provide a high catch rate, but a low harvest to catch ratio. Stocking schemes and regulations are designed to create populations where, compared to the Regional Management category, fish longer than 14 inches make up a greater proportion of the population. Dune Lake, Koole Lake, and Rainbow Lake are currently listed in this category.

**Fishery Management Objective:** To create and maintain the opportunity to catch and harvest the daily bag limit while providing the opportunity to catch 1 fish 18 inches or longer within a day's angling.

**Bag Limit:** 5 fish (all species combined).

**Length Limit:** Only 1 fish (any species) 18 inches or longer.

**Season:** Open year round or potentially seasonally restricted.

**Gear:** None or moderate restrictions.

### SPECIAL MANAGEMENT LAKES

**Description:** These fisheries have characteristics deemed by the public as deserving special management. The lakes are productive and the fisheries are typically managed to produce trophy size fish. Stocking schemes and regulations are designed to create populations where, compared to the Conservative Management category, fish 18 inches or longer make up a greater proportion of the population. No lakes are currently in this category.

**Fishery Management Objective:** Manage the fishery to maintain a high probability of catching several large fish within a day's angling for an experienced angler.

**Bag and Length Limit:** Only 1 fish 18 inches or longer, any species, or another appropriate bag and size limit or potentially catch and release.

**Season:** Seasonal restrictions possible.

**Gear:** Open to public input, no bait, and single-hook artificial lure or artificial fly only.

## SUB-CATEGORIES

**Large:** Lakes greater than 101 ha (250 acres) with high angler participation relative to other systems within the area. Access is via well-established road systems and in some cases multiple access points. Stocking is performed annually for most species, but alternate year stocking is also conducted.

**Urban:** Characterized by being within short driving distance from a population center and accessed via the road system. These lakes receive multiple stockings throughout the year with catchable size fish to accommodate higher levels of harvest per ha (acre).

**Rural:** Located outside of major population centers with either road or short (<2 miles) access. These systems receive a single stocking of fingerling or catchable size fish per year and are exposed to moderate or low harvest per ha (acre).

**Remote:** Defined by access by either a long trail or via aircraft. These lakes are generally stocked once per year, or in some cases alternate years, with fingerlings. Harvest per ha (acre) is generally low.

## NEW WATER BODIES AND MOVING WATER BODIES TO A DIFFERENT CATEGORY

Requests to nominate a new water body for stocking or to move an existing water body to a different category can originate with the public, local fish and game advisory committees, the Board of Fish, or ADF&G. Any candidate water body must first meet *Statewide Stocking Policy* standards (A1-A11).

### NEW WATER BODY

When a water body is nominated for stocking it will by default be placed under the Regional Management category. The water body's characteristics (surface area, physical and chemical properties, productivity, presence of other species, and access) will be evaluated. The water body will be stocked when these factors indicate that a successful fishery can be established.

### MOVING TO DIFFERENT CATEGORY

The process of moving a water body to a different management category is driven by the public's desire to change the management goals for a water body. Generally, the characteristics of the water body combined with the public's expectation of the fishery will determine the management category. ADF&G and the public must consider what characteristics and resources are required for a successful fishery under the desired management category. Some questions to consider are as follows:

1. What is the public's and ADF&G's recommendation for management category?
2. Can the water body meet the criteria for the proposed management category?
3. What is the impact to other fisheries if a fish hatchery must modify fish production or fish must be moved from other fisheries?
4. What is the need for access improvements such as road, boat launch, and parking facilities?
5. What evaluation is required to evaluate or monitor the fishery?

## **Region III Stocked Fisheries Evaluation**

### **PROGRAM OVERVIEW**

Evaluations of stocked fish populations and lakes are needed to determine if sufficient numbers and sizes of fish are available to anglers, examine population and limnological parameters, and evaluate candidate waters for new stockings. Criteria for selecting study lakes include: 1) prioritized information needs from area managers; 2) public requests for stocking a new lake; 3) public inquiries for information about a lake or species present in a lake; and, 4) the time-elapsed since the last evaluation.

Single-sample capture events are the primary method used to monitor stocked fisheries. Fishery specific objectives are based on standards developed by Skaugstad (2016). The standards are presented as length-frequency distributions (LFD) that correspond to each of the three management approaches described in the *General Management Plan for Stocked Fisheries in Region III*. Individual lakes are sampled and catch data are placed into length categories and compared to the standards. The model output provides a defensible evaluation of lake-specific growth that can be used to adjust stocking schedules and determine if certain management objectives are being achieved. The preferred frequency to conduct single-sample evaluations on a stocked fishery is once every 5-10 years.

Research projects are also conducted when the single-sample events are insufficient. Hatchery, research, and management staff collaborate to develop project-based objectives to answer specific management questions. These studies may seek to optimize stocking efficiency and improve angling opportunities given finite resources, estimate population parameters (e.g. survival and abundance), conduct creel surveys, or investigate limnological variables possibly affecting fish growth or survival.

Region III receives multiple new stocking requests annually. After legal public access has been verified or established, baseline data is collected on fish, water quality and morphometry. If a lake is approved for stocking, these data are used in conjunction with public input, anticipated harvest, and current hatchery production to select the species, life stage, and number of fish to stock.

<b>Total Arctic char</b>									

#### Notes:

- (a) Sport Fish Division plans to stock all release sites, regardless of lake category, with mixed-sex certified triploid Arctic char. Some category 1 lakes may also be stocked with post-spawning, mixed-sex, diploid broodstock. If a shortage of mixed-sex certified triploid Arctic char occurs, the following substitutions may be permitted:
  - Category 1 (landlocked lakes): Mixed-sex uncertified triploids, mixed-sex diploids.
  - 3N/2N : Triploid fish are preferred, diploid fish may be released. 3N: Only triploid fish are permitted for release.
  - Categories 2, 3, 4, and 5 (nonlandlocked lakes) : No substitutions are permitted.
- (b) Target release dates indicate relative priority of fish releases. Actual stocking dates may vary depending on lake conditions.

### **REGION III: rainbow trout Planned Releases**

Table III-RT3. Planned releases of rainbow trout in Region III listed by area and release site.

							<b>Sport Fish 5-Year Stocking Plan</b>					Page 6 of 6 18-Dec-17		
Fishery Plan	Area	Hatchery	Release Site	Lifestage	Ploidy	Category	Lake	Target Release Size/Date	2018 Projected	2019 Projected	2020 Projected	2021 Projected	2022 Projected	
									249,870	243,670	249,870	243,670	249,870	
<b>Total rainbow trout</b>														

Notes:

- (a) All rainbow trout released from RBSFH will be all-female certified triploid populations.
- (b) Target release dates indicate relative priority of fish releases. Actual stocking dates may vary depending on lake conditions.
