I. PROGRESS ON PROJECT OBJECTIVES DURING LAST SEGMENT

OBJECTIVE 1: Quantify pregnancy rates, parturition rates, and parturition dates of adult cow moose.

Job/activity 1a: We captured 35 adult female moose in November 2012 and 38 in March of 2013. Pregnancy rates were 88% as determined through blood testing. Parturition rates were 77% based on aerially monitoring cows daily during calving. Parturition dates were from 16 May through 18 June with a median parturition date of 25 May. Parturition dates were determined through daily aerially monitoring using vaginal implant transmitters. Similar data will be collected again in 2014.

OBJECTIVE 2: Determine twinning rates of adult cow moose.

Job/activity 2a: We conducted aerial surveys of radio collared cows during calving to determine a twinning rate of 36%. Similar data will be collected again in 2014.

OBJECTIVE 3: Determine cow and calf mortality rates.

Job/activity 3a: Radio collared cows were aerially monitored daily during calving. Since getting a visual confirmation on calves after green-up is difficult, calf survival will be fully assessed in the fall when visual confirmations can be done.
**OBJECTIVE 4:** Determine seasonal movements of radio collared cows.

Job/activity 4a: Periodic aerial telemetry flights of collared cows have occurred since initial collaring. Movement data has not yet been analyzed.

**OBJECTIVE 5:** Assess nutritional condition of cow moose at the yearly peak and nadir.

Job/activity 5a: Body condition from rump fat indices were assessed during spring 2012 captures. Median rump fat of adult cows was 1.1cm. Body condition will be assessed in the fall of 2013 and again in the spring of 2014.
