1996 Deer Hunter Survey

Summary Statistics

August 1996 - January 1997 season

Introduction

This is a report of the results of an annual deer hunter mail survey conducted by the Alaska Department of Fish and Game, Division of Wildlife Conservation. We have conducted the survey since 1980 to quantify the Sitka blacktail deer harvest in Southeast Alaska. Results of the survey contribute to management decisions and recommendations made by Region I area biologists to the Board of Game. They are also used by the U.S. Forest Service to help determine how its logging and other land management decisions affect deer hunting. The Federal Regional Subsistence Council and Federal Subsistence Board use these survey results when deliberating federal subsistence hunting regulation changes. The statistics summarized in this report rely on a survey mailed to a sample of hunters who obtained deer harvest tickets throughout Southeast Alaska during the 1996 hunting season.

Form -- We made several substantial changes in the form and content of the 1996 survey. First, fewer hunters were surveyed (see Distribution section). Second, we shortened the survey form to ask details only about successful hunting trips. And third, the survey package was slimmer than in the past because we eliminated the map with numbered wildlife harvest areas used to report hunt areas. In place of the map we asked hunters to be specific in describing where they killed deer.

We made these changes for two main reasons. First, we were looking to reduce costs while still getting the most important information needed for good deer management. And second, we were trying to increase the number of hunters responding to the survey. For the past few years hunter response to the survey has been below 50% regionwide and lower still from some smaller communities. We suspected many deer hunters were not responding because of the length of the survey and because some received it every year.

Distribution -- Not every hunter received a survey and not everyone who received one responded. Approximately one-third of the deer hunters residing in Southeast Alaska who obtained deer harvest tickets were sent surveys. This is a change from past surveys in which hunters from smaller communities were surveyed at a higher rate (100%) than those from larger communities.

Response -- The overall response rate was approximately 58%. Because response rates varied by community, the responses received from each community were multiplied by an expansion factor to calculate estimates for hunters possessing deer harvest tickets in the community as a whole. The higher the sample fraction and percentage of responses from a community, the lower the expansion factor. And, the higher a community's response rate, the better these data represent the actual hunting effort and success of all hunters with deer harvest tickets in that community.

This year's overall response rate was up from the 46.8% response on last year's survey. The response rate was the highest since 1985. Besides making changes in the survey, we also sent expanded summaries of the previous year's survey to all those who responded to the 1995 survey. It is possible the changes we made in the survey as well as the additional contact with surveyed hunters contributed to the increased response rate. Although the improvement in the overall response rate is encouraging, annual response rates from many villages, such as Angoon, Hydaburg, Kake, Klawock, and Hoonah are still unsatisfactorily low. The

continued low response rates from many rural areas reduces our confidence in the ability of the survey to accurately describe actual deer hunting effort and success of some rural communities in Southeast Alaska.

The improved overall survey response rate is encouraging, but there are tradeoffs. Although with the shorter survey we can still find out how many hunters got deer and where, we have no information about where people hunted unsuccessfully. This makes it impossible for us to determine success rates and hunter effort for any area smaller than the region as a whole. For instance, in past years we could estimate from the survey that on Douglas Island near Juneau, 800 people hunted for 2,500 days and 320 of them killed 500 deer for a success rate of 40%. Now, however, we can only say 320 people killed 500 deer on Douglas. We won't know how many hunted and were unsuccessful.

Kill location -- Not all hunters responded to questions as asked. For example, some hunters did not describe kill location or did not describe it specifically enough for us to assign it to a Wildlife Analysis Area (WAA), island, major hunting area, or Game Management Unit (GMU). When kill location was not identified specifically enough to assign a GMU, or Major hunting area, or WAA, we report them as "unknown" or "missing" in the summary. In the past, 99% of hunters responding reported kill locations down to the scale of Wildlife Analysis Area. This year 99% of hunters gave detailed enough information for us to code kill locations to GMUs or islands. However, only 93% responded in enough detail for us to code to Major hunt areas, and only 91% gave enough detail to code kill locations to WAAs. In short, the level of detail hunters provided was lower when hunters described their kill locations this year than when they reported it using a map code in previous years.

Area biologists will evaluate survey results over the coming months to decide whether having less detailed geographic information on hunter effort and kill locations is adequate for the region's management needs.

Results -- Throughout the 1996 season deer hunters reported significantly less success than they are used to. Estimates from the mail survey bear that out. Deer kill was about 9,100, the lowest since 1982 and 4,000 less than the average for the past 15 years. The estimated success rate for Southeast hunters was 52%, 11 percentage points lower than the average. Hunter numbers were slightly higher than average at 8,270 but they spent about 25% more time afield than average. Hunters spent almost 7 days afield for each deer killed instead of 4; and the average number of deer killed per hunter was 1.1 compared to a 1.6 average for the past 15 years.

The 1996 deer hunting season was characterized by an almost total lack of snow at low elevations throughout much of Southeast. That allowed deer to remain dispersed, at high elevations, and harder for hunters to find. Besides helping many deer evade hunters, the snowfree early winter probably resulted in a higher than usual overwinter survival in some areas.

Snowfree conditions in roaded areas probably gave hunters access to normally impassable, unplowed, logging spur roads for more of the season. We think this contributed to higher hunter-day totals for communities with access to extensive road systems like those on Prince of Wales Island. Hunters were able to spend more days hunting more of the road system than usual, but with less success because deer were so dispersed.

Pellet group counts done in spring 1997 after the hunting season indicate deer populations in most of Southeast are relatively stable or even increasing, with only about 25% of the drainages showing declines from when they were last surveyed. This leads us to conclude that weather, not low deer numbers was responsible for low hunter success in most of Southeast during the 1996 season.

Alaska's Game Management Units

The Federal Aid in Wildlife Restoration Program consists of funds from a 10% to 11% manufacturer's excise tax collected from the sales of handguns, sporting rifles, shotguns, ammunition, and archery equipment. The Federal Aid program allots funds back to states through a formula based on each state's geographic area and number of paid hunting license holders. Alaska receives a maximum 5% of revenues collected each year. The Alaska Department of Fish and Game uses federal aid funds to help restore, conserve, and manage wild birds and mammals to benefit the public. These funds are also used to educate hunters to develop the skills, knowledge, and attitudes for responsible hunting. Seventy-five percent of the funds for this report are from Federal Aid.
