1997 Deer Hunter Survey

Summary Statistics

August 1997 - January 1998 season

(January is a Federal hunting season only but we include reported harvest data from that season in our survey.)

Introduction

This is a report of the results of an annual deer hunter mail survey conducted by the Alaska Department of Fish and Game, Division of Wildlife Conservation. We have conducted the survey since 1980 to quantify the Sitka blacktail deer harvest in Southeast Alaska. Results of the survey contribute to management decisions and recommendations made by Region I area biologists to the Board of Game. They are also used by the U.S. Forest Service to help determine how its logging and other land management decisions affect deer hunting. The Federal Regional Subsistence Council and Federal Subsistence Board use these survey results when deliberating federal subsistence hunting regulation changes. The statistics summarized in this report rely on a survey mailed to a sample of hunters who obtained deer harvest tickets throughout Southeast Alaska during the 1997 hunting season.

Form – The 1997 season survey form was slightly longer and more detailed than the previous year. After reviewing the 1996 season results which contained only hunter kill locations, Southeast Alaska Area Biologists decided that more detailed geographic information on hunter effort was needed to make good management decisions. Consequently, for the 1997 season survey, in addition to asking hunters to report where they killed deer, we also asked where they hunted and were unsuccessful. We also asked whether hunters participated in the state “proxy” or federal “designated hunter” programs and how many deer they took for others under those programs. This was the first time hunters rather than beneficiaries of these programs were asked about their participation.

As with the 1996 survey we did not provide a map with the survey for hunters to use in reporting their hunting sites. Instead we asked hunters to be specific in describing the locations (islands, bays, shore and/or drainages) where they hunted deer.

Distribution – Not every hunter received a survey and not everyone who received one responded. Approximately one-third of the deer hunters residing in Southeast Alaska who obtained deer harvest tickets were sent surveys.

Response – The overall response rate of those who received surveys was approximately 58%. Because response rates varied by community, the responses received from each community were multiplied by an expansion factor to calculate estimates for hunters possessing deer harvest tickets in the community as a whole. The higher the sample fraction and percentage of responses from a community, the lower the expansion factor. And, the higher a community's response rate, the better these data represent the actual hunting effort and success of all hunters with deer harvest tickets in that community.

This year's overall response rate was equal to the response on last year's survey. The response rate for the past two years was the highest since 1985. Although the continued good overall response rate is encouraging, annual response rates from many villages, such as Angoon, Hoonah, Hydaburg, Kake, Klawock, Port Alexander, Naukati Bay and Edna Bay are too low. The continued low response rates from many rural areas reduces our confidence in the ability of the survey to accurately describe actual deer hunting effort and success in parts of Southeast Alaska.

Kill location – Not all hunters responded to questions as asked. For example, some hunters did not describe kill location or did not describe it specifically enough for us to assign it to a Wildlife Analysis Area (WAA), island, Major hunting area, or Game Management Unit (GMU). When kill location was not identified specifically enough to assign to a GMU, island, Major hunting area, or WAA, we report them as "unknown" or "missing" in the summary. In the past, when hunters were provided a map to code hunt locations, 99% of responding hunters reported hunt locations down to the scale of WAA. In the 1996 season survey done without a map, 99% of hunters still provided enough detail for us to code kill locations to GMUs or islands but only 91% gave us enough detail to code to WAA. Although the percentage of hunters who gave detailed enough information for us to code hunt locations to GMUs or islands dropped

to 96% this year, those who gave enough detail for us to code to WAA increased to 96%. It was characteristic of survey respondents this season that if they gave any hunt location information at all they usually provided enough detail to code hunt locations to the level of WAAs.

Results – Total deer harvest for the 1997/98 season is estimated at 10,626, an increase of about 1,500 over the previous season but still 2,400 less than the average for the previous 16 years. The estimated success rate for Southeast hunters was 58%, 7 % lower than the long-term average. Hunter numbers were about 400 (5%) lower than average at 7,812. Hunters spent 4.0 days afield for each deer killed, similar to the long-term average of 3.8 days/deer. The total number of hunter-days afield was 16% below the long-term average. That is partially a reflection of fewer hunters but also indicates lower overall effort by each hunter (5.5 days afield vs. 6.1 days long-term average). The average number of deer killed per hunter was 1.4 compared to a 1.6 long-term average.

For the second year in a row, the 1997 deer hunting season was characterized by a lack of snow at low elevations throughout much of Southeast. That again allowed deer to remain dispersed, at high elevations, and harder for hunters to find. Nevertheless, hunters were more successful than in 1996 in most of Southeast Alaska. Better traveling weather may have contributed to higher hunting success. Perhaps a greater overall number of deer in some areas made for better hunting.

Pellet group surveys done after the hunting season in spring 1998 indicate deer populations in the northern half of Southeast are relatively stable or increasing. Besides helping many deer evade hunters, the third consecutive mild winter probably resulted in a higher than usual overwinter survival in some areas. However, pellet group surveys in GMUs 1A and 2 in southern Southeast Alaska indicated lower deer densities in most drainages from when they were last surveyed. A combination of weather, lower hunter effort, and possibly lower deer densities in some areas appears to be responsible for lower than average hunter success in most of Southeast during the 1997 season.

GMU 1A – Estimated harvest was stable in the unit (which includes Revillagigedo and Gravina islands and Cleveland Peninsula) compared to the previous year, but reported harvest was 13% does. Doe harvest is illegal in Unit 1A.

GMU 2/Prince of Wales Island – The 1997 season produced the lowest harvest on Prince of Wales (POW) in over 10 years. Harvest fell for the second consecutive year and was down 26% from the previous season. This is uncharacteristic of POW harvest which usually has a more stable annual harvest than the large islands in the northern part of the region. Central POW in the Craig, Klawock, Thorne Bay, Kasaan area and Northern POW around Pt. Baker/Port Protection and Whale Pass had the greatest decline in harvest from the previous year. Coffman Cove hunters, however, took 36% more deer than during the previous season.

Hunters from POW communities spent much less time afield on POW in 1997 than in 1996. Collectively, hunters from the larger communities on the island reported 10,000 fewer hunter days than in 1996. Whereas POW deer hunters reported an average of 2-3 weeks hunting in 1996, they reported hunting for a week or less in 1997. At this time it is unclear whether the 1997 data are the result of a widely dispersed deer population that eluded hunters or if the data reflect some decline in the deer population. A population decline could be due to a number of factors including habitat loss, predation, or overhunting. ADF&G will be closely monitoring the 1998 POW deer harvest to see if the downward trend continues.

GMU 1B and 3 – Deer harvest on the central mainland (GMU 1B) doubled from the previous year with the largest number of deer coming from the Thomas Bay area. More deer than usual were taken south of the Stikine River. GMU 3 harvest was similar to 1996. Half the 1997 deer harvest in the Petersburg – Wrangell area came from Zarembo Island. Zarembo is relatively close to both communities, has good access for hunters with an extensive logging road system, and two Forest Service docks which can be used by hunters to unload ATVs or other vehicles. Zarembo's deer population appears to be high. The seral stage of many of the island's clearcuts is optimal for deer forage, and vegetation is still short enough for deer in clearcuts to be visible to hunters. As the second-growth canopy closes and shades out deer forage, harvests on Zarembo may decline. Pellet group surveys in spring 1998 indicated that as a result of a third consecutive mild winter the GMU 3 population was stable or increasing. No marked deer from an ongoing radio telemetry study of deer on Mitkof Island died from starvation or exposure during the winter of 1997/98 suggesting there are healthy and strong deer numbers in the area leading into the 1998 season.

GMU 1C – Estimated harvest on Douglas Island was 30% higher than the previous season with a higher percentage of bucks in the harvest. Because of its proximity to Juneau hunters it is consistently the most heavily hunted island in relation to size in Southeast Alaska. It has the fifth highest number of reported hunter days per island behind Prince of Wales, Admiralty, Chichagof, and Baranof. It also has the lowest island hunter success rate (27%). Pellet group surveys in spring 1998 indicate high populations on the northern portion of the island. Pellet group density on the west side of Douglas declined significantly from the 1997 survey. It is unclear whether the low density below 1500' represents a population decline or evidence that a large part of the deer population stayed at high elevations throughout most of the mild winter. Pellet group crews encountered no winter-killed carcasses. Harvest on Shelter and Lincoln islands was slightly higher than 1996 but over half of the deer taken from those islands were does.

GMU 4 – Estimated harvest was up 25% for the unit overall compared to 1996. Admiralty, Baranof, and Chichagof islands' harvest all increased from the previous year. Baranof increased the most, about 50% higher than 1996. The increase in Baranof harvest came from areas around Sitka. The Nakwasina/Neva Strait area's harvest was twice the previous season. The harvest from Peril Strait increased 70%. Logging operations in the Rodman/Saook bays area of Peril Strait during fall 1997 is a likely reason for the harvest being two-and-a-half times the average in that portion of Peril Strait. Development activity typically results in more people and hunters in remote areas. Reconstruction of logging roads also improves access, not only for logger/hunters but for others who may bring ATVs or other vehicles to the area. Harvest on the Northeast Chichagof Island road system was nearly double that of the previous season. The Peril Strait shores of Chichagof saw a small increase in harvest while the number of deer taken in the west Chichagof/Yakobi area declined. Harvest on northern and southeastern Admiralty was about twice that of 1996. Slightly more deer were taken on west Admiralty while harvest in Seymour Canal declined somewhat from 1996.

January 1998

Dear Southeast Alaska Hunter:

Attached is our 1997/98 deer hunter survey. We are sending it to a random selection of deer hunters who picked up deer harvest tickets for this past hunting season. Please invest a few minutes of your time to help manage Alaska's deer. We really need your answer even if you did not hunt.

The information you provide is essential to good deer management. In addition to harvest, questionnaire responses tell us what hunting areas are important to each community. Your knowledge and familiarity with the areas you hunt help us understand how local deer populations are doing and how deer hunting will be affected by other resource uses.

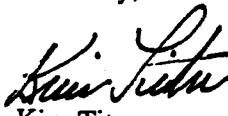

This year, in addition to asking you to report where you killed deer, we also would like to know where you hunted and were unsuccessful. We ask that you write in the name of the specific location of each hunting trip -- the bay, shore (N, S, E or W), stream drainage, and island or mainland area where you hunted. Please be as specific and accurate as you can. The more detailed the information you provide, the more confident we can be about what deer hunting areas are important to each community.

This year's survey also has some new questions about participation in the state "proxy" and federal "designated hunter" programs.

Survey results in summarized form are used by the Alaska Board of Game and the Federal Subsistence Board to set seasons and bag limits, and make other hunting regulations such as allocations to communities. In addition, the U.S. Forest Service uses the summarized data to help make decisions about what areas will be logged. Those who respond to the survey help make management decisions in areas important to them.

We plan to send summary results of the survey to all who respond whether you hunted or not. Thanks for your continued cooperation.

Sincerely,

Kim Titus
Regional Supervisor

ALASKA DEPARTMENT OF FISH AND GAME

1997/98 SEASON DEER HUNT REPORT

Report No. - 13882

Nonresident Alaska Resident Community: _____

Did you hunt deer in Southeast Alaska between August 1, 1997 and January 31, 1998?

No If No, you are finished. Please mail this report. Thanks.

Yes If yes, please complete the following information for each **successful or unsuccessful trip YOU made to hunt deer. Include only deer you killed, not those of others in your party. Include deer you killed for someone else as a state "proxy" or federal "designated hunter". Do not report deer someone else killed for you as a proxy or designated hunter.**

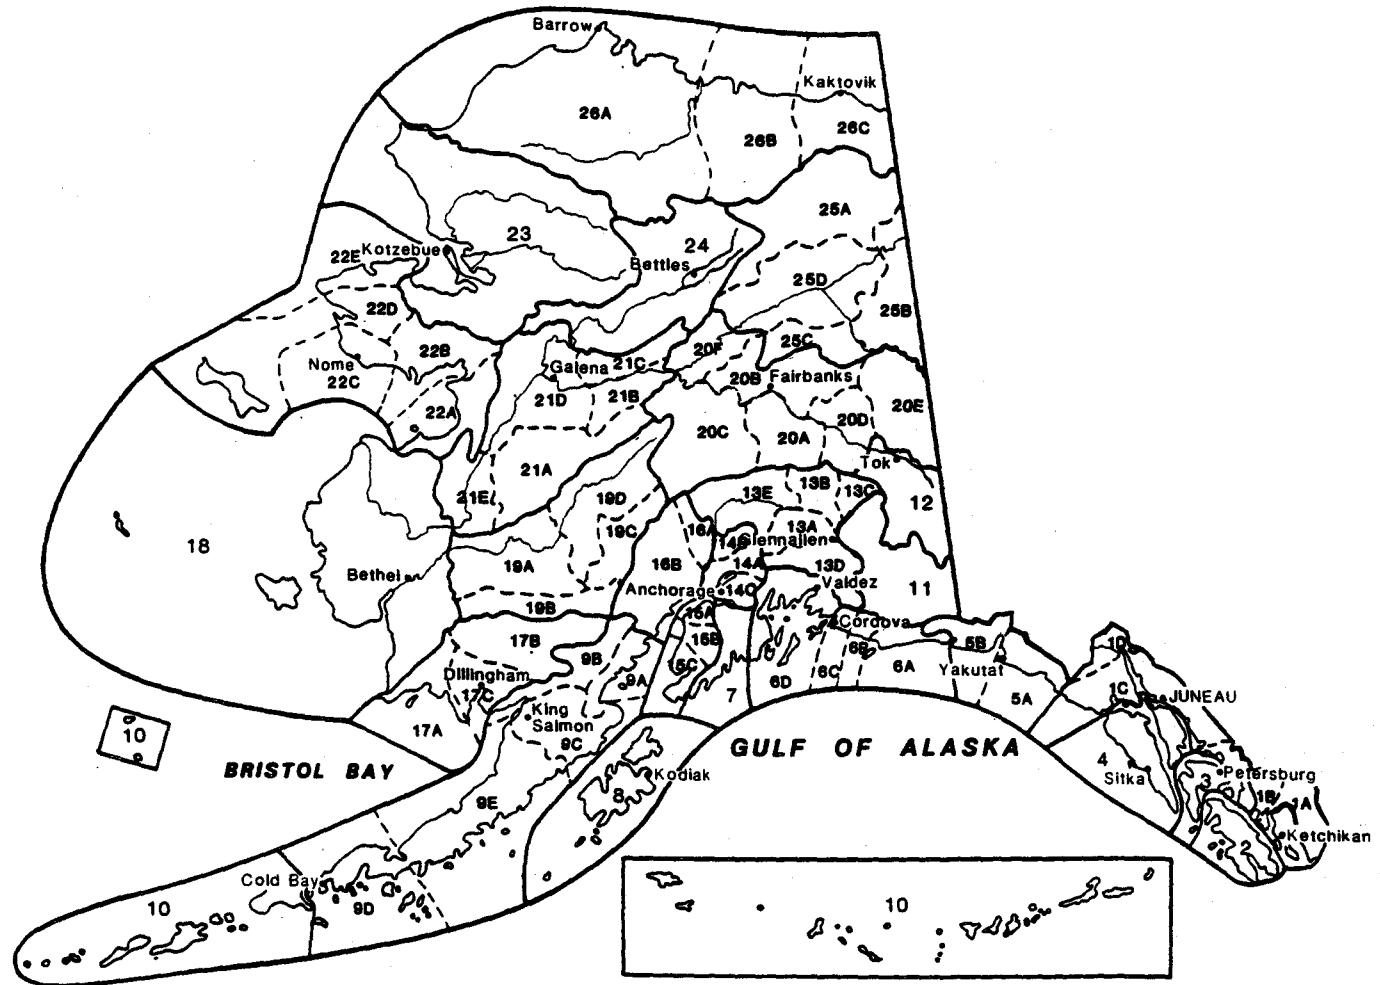

SPECIFIC LOCATION OF TRIP (please identify Bay, Shore [N, E, S, or W], Drainage, and Island/mainland)	No. of bucks	No. of does	Month of Trip	No. of days hunted	Transportation Used to get to Hunt Area (boat, plane, car, etc.)
Example N. Shore Tenakee Inlet, Chichagof Is.	0	1	10	2	boat
Example Upper Staney Creek, POW	0	0	9	12	truck
1.					
2.					
3.					
4.					
5.					
6.					

Did you hunt deer for someone else as a state proxy hunter? Y N ; as a federal designated hunter? Y N

If yes, how many of the deer reported above did you take as a proxy? _____; as a designated hunter? _____

We are interested in any comments or observations you may have. Please send them to the address on the back of this card, or contact your local area biologist. Thanks for helping with wildlife management in Southeast Alaska.

Alaska's Game Management Units

The Federal Aid in Wildlife Restoration Program consists of funds from a 10% to 11% manufacturer's excise tax collected from the sales of handguns, sporting rifles, shotguns, ammunition, and archery equipment. The Federal Aid program allots funds back to states through a formula based on each state's geographic area and number of paid hunting license holders. Alaska receives a maximum 5% of revenues collected each year. The Alaska Department of Fish and Game uses federal aid funds to help restore, conserve, and manage wild birds and mammals to benefit the public. These funds are also used to educate hunters to develop the skills, knowledge, and attitudes for responsible hunting. Seventy-five percent of the funds for this report are from Federal Aid.
