## **Deer Harvest in Southeast Alaska 1980-1999**

# 1999 Deer Hunter Survey

## Summary Statistics

August 1999 – January 2000 season

(We include reported harvest data from January in our survey even though that is only a Federal hunting season.)

### INTRODUCTION

This is a report of the results of an annual deer hunter mail survey conducted by the Alaska Department of Fish and Game, Division of Wildlife Conservation. The survey was mailed to a sample of hunters who obtained deer harvest tickets throughout Southeast Alaska during the 1999 hunting season. We have conducted the survey since 1980 to quantify the Sitka black-tailed deer harvest in Southeast Alaska. Results of the survey contribute to management decisions and recommendations by Region I wildlife biologists to the Board of Game. They are also used by the U.S. Forest Service to help determine how logging and other land management decisions affect deer hunting. The Federal Regional Subsistence Council and Federal Subsistence Board use these survey results when deliberating federal subsistence hunting regulation changes.

**Form** – The 1999 season survey form was identical to that of the previous year. As with all surveys since 1996 we did not provide a map with the survey for hunters to use in reporting their hunting sites. Instead we asked hunters to be specific in describing the locations (islands, bays, shore and/or drainages) where they hunted deer. For the third year we also asked if hunters participated in the state “proxy” or federal “designated hunter” programs and the number of deer they took for others under those programs.

**Distribution** – Not every hunter received a survey and not everyone who received one responded. Approximately one-third of the deer hunters residing in Southeast Alaska who obtained deer harvest tickets were sent surveys.

**Response** – The overall response rate of those who received surveys was 60%. Because response rates varied by community, the responses received from each community were multiplied by an expansion factor to calculate estimates for hunters possessing deer harvest tickets in the community. The higher the sample fraction and percentage of responses from a community, the lower the expansion factor. And, the higher a community's response rate, the better these data represent actual hunting effort and success of all hunters with deer harvest tickets in that community.

This year's overall response rate equalled last year's as the highest since we began mail surveys in 1980. Although the continued good overall response rate is encouraging, annual response rates from many small communities, such as Angoon, Hoonah, Hydaburg, Kake, Klawock, Metlakatla, Meyers Chuck, Pelican, Naukati Bay and Edna Bay are too low. The continued low response rates from many rural areas reduce our confidence in the ability of the survey to accurately describe actual deer hunting effort and success in parts of Southeast Alaska.

Kill location – Along with an increased survey response rate, the number of hunters who described kill location specifically enough for us to assign it to a Game Management Unit (GMU), island, major hunt area, or Wildlife Analysis Area (WAA) increased. When kill location was not identified specifically enough to assign to a GMU, island, major hunt area, or WAA, we report them as "unknown" or "missing" in the summary. In the past, when hunters were provided a map to code hunt locations, 99% of responding hunters reported hunt locations down to the scale of WAA. In the 1999 survey, without a map, the percentage of successful hunters who gave detailed enough information for us to code hunt locations to GMUs and islands was 99%. The percentage giving enough detail to code to major hunt areas increased from 97% in the 1998 survey to 98% in 1999; the percentage of those providing sufficient information for coding to WAAs increased 3% to 97% in 1999.

**Results** – Total deer harvest for the 1999/2000 season is estimated at 11,019, an decrease of about 1300 over the previous season and 1800 less than the average for the previous 18 years. Hunter numbers at 7785 were slightly higher than last year. The increase in number of hunters interrupts a 4-year decline but is still 360 (4%) lower than average. The average hunter spent 5.4 days hunting this year, a half day less than the long-term average. Hunters bagged a deer every 3.8 days afield, equalling the long-term average. The total number of hunter days afield increased but remains 14% below the long-term average. Hunter success rate declined to 59% in 1999, 4% below the long-term average. The average number of deer killed per hunter was 1.4, slightly less than the long-term average.

The lower regional harvest total is probably the result of the severe winter of 1998/99. Mortality from that winter reduced deer densities in northern and central Southeast and probably affected hunter success in those areas. Hunter success and days afield may also have been reduced by the unusually wet (even for Southeast Alaska) fall and early winter weather of the 1999 hunting season.

#### *Proxy and designated hunters*

The number of hunters reporting as state "proxy" or federal "designated" hunters was higher in 1999 than 1998. We estimate 197 state proxy hunters from eleven communities took a total of 233 deer with a 54% success rate in 1999. That compares with about 176 hunters, 237 deer and a 54% success rate in 1998. 1999 reporting proxy hunters came from the following Southeast communities: Craig, Hoonah, Juneau, Ketchikan, Klawock, Petersburg, Sitka, Skagway, Thorne Bay, Wrangell.

We estimate about 215 federal designated hunters from 8 communities took 321 deer with a 56% success rate. That compares with 250 hunters from 10 communities reporting 603 deer and a 74% success rate in 1998. 1999 reporting designated hunters came from the following Southeast communities: Craig, Juneau, Klawock, Petersburg, Sitka, Thorne Bay, and Wrangell.

#### *Weather*

Weather during the 1999/2000 deer hunting season was warm and unusually wet even for rainy Southeast Alaska. Rain fell on all but a few days from mid-August through December at low

elevations in most of Southeast Alaska. The stormy, rainy weather may have dissuaded some hunters from going afield as often as usual, especially those relying on boats for hunting access. The persistent inclement weather may also have reduced hunting success in some areas. Snow was not a factor during the hunting season. Snowfall was well below normal at low elevations and near normal at high elevations throughout the winter in Southeast. Because of the lack of persistent snow cover at low elevations, the winter of 1999/2000 can be described as mild in terms of its probable effects on the deer population. Pellet group surveys completed after the hunting season in spring 2000 found deer densities reduced somewhat in northern and central Southeast Alaska, probably as a result of the severe winter of 1998/99. Pellet group densities in southern Southeast were stable to slightly higher.

#### *Results by Game Management Unit (GMU)*

**GMU 1A (Revillagigedo and Gravina islands, Cleveland Peninsula, and Misty Fjords mainland)** – Estimated harvest of 278 was half of last year and the long-term average for the unit (600). The overall hunter success rate for Unit 1A was only 25%, considerably below the regional average of 59%. Gravina Island harvest was only 20% of 1998. The number of hunters on Gravina declined by 46%, from 360 in 1998 to 194 in 1999. Reported hunter success rate on Gravina was only 13%, far lower than anywhere else in Region I, and hunters spent 16 days afield for every deer taken. A dispersed deer population early in the season and poor weather during the rut which made boat travel risky were factors contributing to the low deer harvest on Gravina. Spring 2000 pellet group densities indicate the deer population is stable.

The increase in the Cleveland Peninsula harvest from 23 deer in 1998 to 59 deer in 1999 broke a four-year trend of declining harvest but the 1999 total was still only 39% of the long term average of 150. Number of hunters using Revilla Island declined by 14% and the harvest declined by 40% from the previous year. Reported hunter days increased however, as percent success on Revilla declined from 34% in 1998 to 22% in 1999 with hunters spending 13 days afield for every deer taken.

**GMU 2 (Prince of Wales and neighboring islands)** – Harvest on Prince of Wales (POW) is estimated at 2384 deer, equal to the long-term average. Although total harvest on POW is comparable to that on Chichagof Island in GMU 4, POW hunters spend 5.3 days afield for each deer taken compared to 2.4 days per deer on Chichagof. Hunter days totalled 12,600, a noteworthy 27% increase over 1998.

Harvest on southern POW was lower than the previous year. Reported harvest in the Craig/Klawock/Thorne Bay area of Central POW increased significantly for the second straight year to 1060. Harvest was slightly higher on northeast POW and slightly lower than 1998 on northwest POW. The reported number of does killed jumped from 82 the previous season to 198. Ketchikan hunters' share of the reported deer kill on POW fell to 23%, 5% below the rate of the past 2 years. On Heceta Island 73 deer were reported taken, down 45% from 1998. Hunter numbers were down by 40% on Heceta. Harvest was stable or lower on other Unit 2 islands compared to 1998.

The number of hunters (1824) remained about the same on POW as the previous year. Success rate remained stable at 62% and hunters spent an average of 7 days in the field, two more than in

1998. Eighty percent of the harvest in GMU 2 comes from hunters using highway vehicles or ATVs as their main mode of transport compared to 36% for the entire region.

GMU 1B and 3 (Central mainland and islands) – Deer harvest on the central mainland (GMU 1B) in 1999 was slightly higher than in 1998. The total of 85 deer was at the long-term average. For the first time, the North Arm of the Stikine River had the highest harvest, 30 deer, with another 20 reported taken from the Thomas Bay area. GMU 3 harvest of 932 deer was more than 2 times the 19-year average. Zarembo Island was lower than the two previous seasons, however, Zarembo still supplied half of Wrangell hunters' total harvest for the year. Petersburg hunters had success close to home in 1999. Harvest on Mitkof Island (144) was down 33% from the previous season but still equal to the long-term average for the island. The kill on Kupreanof Island was slightly higher than the previous season at 266 and double the average since hunting was resumed there in 1993. Sixty four percent of the harvest in GMU 3 comes from hunters using highway vehicles or ATVs as their main mode of transport; that is up from 45% using vehicles in 1998.

Spring 2000 pellet group surveys of Kuiu Island found that, 10 years after the last survey, there is little change in deer densities which are some of the lowest in Southeast Alaska. South Mitkof pellet group densities were unchanged from last year.

GMU 1C (northern mainland, Douglas, Shelter, and Lincoln Islands) – Estimated harvest on Douglas Island was 254 deer, lowest since 1995 and the third straight season decline. Percentage of bucks in the harvest decreased to 58%; a 26% drop over two years from 1997 but higher than the low of 55% in 1996. The estimated number of hunters dropped 20% to about 640 and number of hunter days declined 35%. Because of its proximity to Juneau hunters, Douglas is consistently the most heavily hunted island per square mile in Southeast Alaska. It slipped from fifth to sixth in number of reported hunter days per island behind Prince of Wales, Admiralty, Chichagof, Baranof, and Revillagigedo. Its hunter success rate of 25% was third lowest of all islands, bettering Revilla (22%) and Gravina (13%). Douglas hunters spent 7 days afield for each deer harvested. The percentage of the harvest on Douglas by hunters using highway vehicles as their main mode of transport dropped to 54% percent from a high of 70% in 1998. Spring 2000 surveys found relatively low pellet-group density on the north and west sides of Douglas Island. Harvest on Shelter and Lincoln islands fell somewhat from that of the previous two seasons. Percentage of does (48%) taken from those islands increased substantially but was still lower than 1997.

GMU 4 (ABC and neighboring islands) – Estimated harvest was down 11% for the unit compared to 1998 harvest. Admiralty, Baranof, and Kruzof islands' harvests were down from the previous year. Chichagof Island harvest was up. The Kruzof harvest of 331 was equal to the long-term average for the island.

The Chichagof/Yakobi kill was an estimated 2671, an increase of about 5% (135 deer) from 1998. The increase in Chichagof harvest came mostly from the Peril Straits area, Ushk Bay/Hoonah Sound to Sitkoh Bay on south Chichagof. Harvest elsewhere on the island was nearly the same as the previous year. Although the number of hunters on Chichagof increased by only 6%, hunter days increased 22%. Most of that increase was due to Juneau hunters whose

numbers increased by 5% and days afield on Chichagof increased 28% from 1998. Juneau hunters took 25% of the harvest on Chichagof/Yakobi, down 2% from 1998.

The estimated Baranof Island harvest was 1975 deer, 20% lower than 1998 and 18% below the long-term (10-year) average. Lower harvests than 1998 were reported on all areas of the island. Hunter numbers were similar to the previous year but hunter days were fewer in proportion to the harvest. On Baranof in 1999, hunters bagged a deer for every 2 days afield, the same as in 1998.

Admiralty's 1999 harvest of 1687 deer was down 20% from 1998 and 32% lower than the 10-year average. Hunter numbers were similar to the previous year but hunters spent 3.4 days afield in 1999 for each deer killed on Admiralty compared to 2.8 days in 1998. The decline was not evenly distributed across the island. Harvest on north Admiralty was similar to 1998, and in the Gambier-Pybus-Eliza area of south Admiralty 1999 harvest was slightly higher than 1998. The greatest declines occurred on west Admiralty and in Seymour Canal. The harvest in Seymour was down 40% from 1998, probably as a result of the severe winter of 1998/99. During beach mortality transects in Seymour Canal in spring 1999, 18 deer carcasses were found in 3 miles of beach. Fourteen of the 18 mortalities were does which usually survive the winter better than fawns or bucks. Most of the 1998 Seymour Canal fawn crop probably succumbed to winter starvation leaving fewer deer for hunters in 1999.

Spring 2000 pellet group surveys in GMU 4 found densities somewhat lower in all the areas surveyed – south Chichagof, northwest Baranof, north Kruzof, south Baranof, and Hood Bay, Admiralty – probably as a result of the harsh winter of 1998/99.

**Outlook** – The long-term effects of the severe 1998/99 winter were probably moderated by the mild winter of 1999/2000. However, in some areas, such as Seymour Canal, an entire year's fawn population may have starved in early 1999 and it may take another year of mild weather for deer numbers to rebound. Spring 2000 pellet-group surveys and mortality transects indicate lower deer densities in northern and central Southeast but stable numbers in the south. Given good hunting weather, hunters in the 2000/2001 season should find healthy deer in good numbers in most parts of Southeast Alaska.

FAX: (907) 465-4272

January 2000

Dear Southeast Alaska Hunter:

Attached is our 1999/2000 deer hunter survey. We are sending it to a random selection of deer hunters who picked up deer harvest tickets for this past hunting season. Please invest a few minutes of your time to help manage Alaska's deer. **We really need your answer even if you did not hunt.**

The information you provide is essential to good deer management. In addition to harvest, questionnaire responses tell us what hunting areas are important to each community. Your knowledge and familiarity with the areas you hunt help us understand how local deer populations are doing and how deer hunting will be affected by other resource uses.

This year, in addition to asking you to report where you killed deer, we also would like to know where you hunted and were unsuccessful. We ask that you write in the name of the specific location of each hunting trip -- the bay, shore (N, S, E or W), stream drainage, and island or mainland area where you hunted. Please be as specific and accurate as you can. The more detailed the information you provide, the more confident we can be about what deer hunting areas are important to each community.

ADF&G Division of Subsistence will also be surveying deer hunters in some communities in Southeast Alaska this winter. If you participate in that survey, we ask that you also send in your response to this mail survey. Even though the surveys ask similar questions their objectives are somewhat different.

Survey results in summarized form are used by the Alaska Board of Game and the Federal Subsistence Board to set seasons and bag limits, and make other hunting regulations such as allocations to communities. In addition, the U.S. Forest Service uses the summarized data to help make decisions about what areas will be logged. Those who respond to the survey help make management decisions in areas important to them.

**We plan to send summary results of the survey to all who respond whether you hunted or not. Thanks for your continued cooperation.**

Sincerely,

Kim Titus  
Regional Supervisor

## Appendix D

### ALASKA DEPARTMENT OF FISH AND GAME

#### 1999/2000 SEASON DEER HUNT REPORT

Report No. - 22403

Nonresident        Alaska Resident        Community: \_\_\_\_\_

Did you hunt deer in Southeast Alaska between August 1, 1999 and January 31, 2000?

No If No, you are finished. Please mail this report. Thanks.

Yes If yes, please complete the following information for each successful or unsuccessful trip YOU made to hunt deer. Include only deer you killed, not those of others in your party. Include deer you killed for someone else as a state "proxy" or federal "designated hunter". Do not report deer someone else killed for you as a proxy or designated hunter.

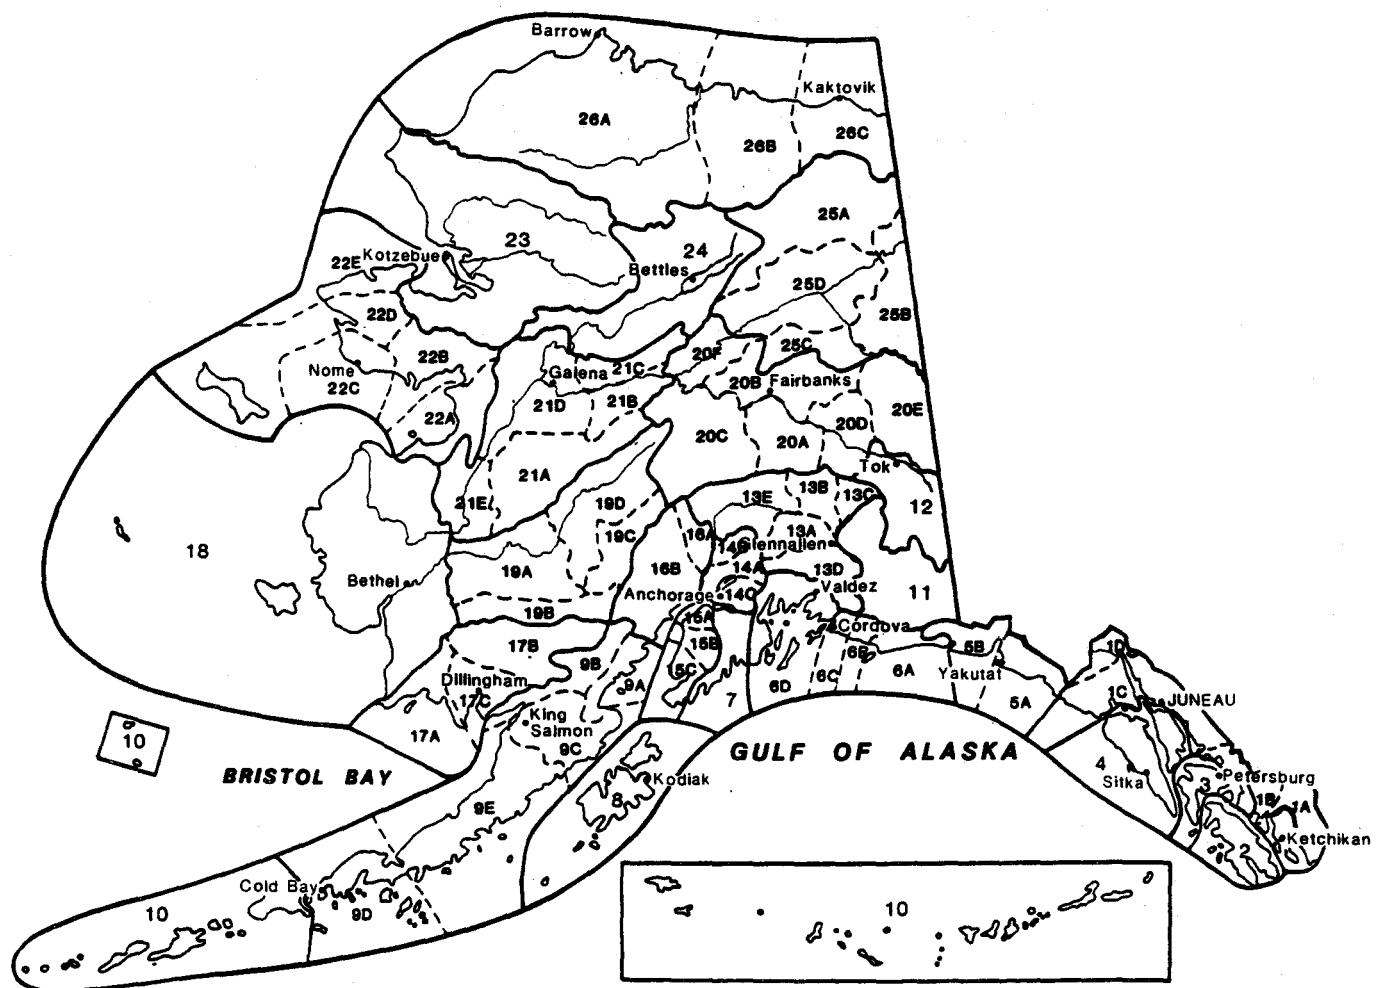

SPECIFIC LOCATION OF TRIP (please identify Bay, Shore [N, E, S, or W], Drainage, and Island/mainland)	No. of bucks	No. of does	Month of Trip	No. of days hunted	Transportation Used to get to Hunt Area (boat, plane, car, etc.)
Example N. Shore Tenakee Inlet, Chichagof Is.	0	1	10	2	boat
Example Upper Staney Creek, POW	0	0	9	12	truck
1.					
2.					
3.					
4.					
5.					
6.					

Did you hunt deer for someone else as a state proxy hunter? Y        N       ; as a federal designated hunter? Y        N       

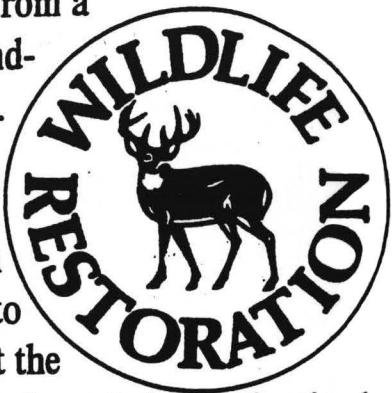

If yes, how many of the deer reported above did you take as a proxy? \_\_\_\_\_; as a designated hunter? \_\_\_\_\_

We are interested in any comments or observations you may have. Please send them to the address on the back of this card, or contact your local area biologist. Thanks for helping with wildlife management in Southeast Alaska.

# Alaska's Game Management Units

The Federal Aid in Wildlife Restoration Program consists of funds from a 10% to 11% manufacturer's excise tax collected from the sales of handguns, sporting rifles, shotguns, ammunition, and archery equipment. The Federal Aid program allots funds back to states through a formula based on each state's geographic area and number of paid hunting license holders. Alaska receives a maximum 5% of revenues collected each year. The Alaska Department of Fish and Game uses federal aid funds to help restore, conserve, and manage wild birds and mammals to benefit the public. These funds are also used to educate hunters to develop the skills, knowledge, and attitudes for responsible hunting. Seventy-five percent of the funds for this report are from Federal Aid.
