**Nonresident Hunters: Their Hunting Trip Characteristics and Economics****INTRODUCTION**

Economic and social values play an increasingly important role in the natural resource decision making process. In order for resource managers, legislators, policy makers, and the public to fully consider alternative natural resource uses, information on the economic and social values the public places on wildlife and wildlife related uses must be considered.

Wildlife is an integral part of the Alaskan lifestyle and a central feature of Alaska's national and international image. In spite of the obvious importance of wildlife to Alaska, few data have been collected on the contributions that wildlife resources make to the local, regional, and state economies, or on the social and economic value both state residents and nonresidents place on these resources.

In 1989, the Division of Wildlife Conservation of the Alaska Department of Fish and Game initiated a program to better understand the social importance and economic impact and value of Alaska's wildlife. The first step the agency took was to cooperate with the U. S. Fish and Wildlife Service Federal Aid Program and the U. S. Forest Service Rocky Mountain Forest and Range Experiment Station to host a workshop with some of the nation's leading resource economists to develop a sound technical strategy for the program. Two products resulted from that workshop: 1) a book explaining the use of economic principles in addressing wildlife management issues in Alaska for wildlife managers and graduate students in wildlife ecology entitled Valuing Wildlife Resources in Alaska, edited by George L. Peterson, Cindy Sorg Swanson, Daniel W. McCollum, and Michael H. Thomas was published in 1992; and, 2) a detailed study plan for estimating the economic impact of wildlife dependent activities on the state's and regional economies was developed.

The economic impact study plan identified four wildlife user/activity combinations: 1) resident hunting; 2) resident wildlife viewing; 3) nonresident hunting; and 4) nonresident wildlife viewing. In 1991, the Division of Wildlife Conservation sought the cooperation of federal resource management agencies to begin to implement the study plan by designing a project to collect and analyze economic data from the first three wildlife user/activity groups. These three groups were included in a single project because there existed appropriate sampling frames for each group from which primary data could be gathered using mail surveys. The project was designed to include collection and analysis of public opinion data on wildlife management issues as well as economic data.

This report explains the methods used in collecting and analyzing data for that project. It also summarizes the results of that project with respect to the economic and hunting trip characteristics information collected from the nonresident hunting user/activity group. Results on the public opinion and demographic data collected from the nonresident hunting user/activity group, and results from all data collected from the resident wildlife viewing and hunting user/activity groups are presented in separate, companion reports.

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics****CONTRIBUTING AGENCIES**

This project was made possible by the contributions of the following agencies:

The Alaska Department of Fish and Game

The U. S. Forest Service Rocky Mountain Forest and Range Experiment Station

The U. S. Fish and Wildlife Service Federal Aid Program

The U. S. Forest Service Region 10

The National Park Service

The Bureau of Land Management

The U. S. Fish and Wildlife Service, Alaska Region

The University of Alaska, Fairbanks

PROJECT DESIGN AND ADMINISTRATION

The purpose of the project was to collect, analyze, and report primary data on the economic and social importance of wildlife from three wildlife user/activity groups: resident hunters, resident wildlife viewers, and nonresident hunters. Mail surveys were chosen as an appropriate and cost effective method of collecting data from individuals in each group. A sampling frame was identified for each of the three user/activity groups and a sample estimated to be sufficient in size to provide economic data at a regional level was drawn from each:

1. Resident Hunters

A simple random sample of 4,000 resident hunters was drawn from the list of Alaska residents who purchased a resident Alaska hunting license in 1991.

2. Resident Wildlife Viewers

A sample weighted by legislative district of 4,725 was drawn from the list of Alaskans registered to vote in 1990, which was the most recent election year.

The samples from the resident hunters and the registered voters were mutually exclusive. If a hunter was selected who had already been selected from the voters list, then another hunter was selected.

3. Nonresident Hunters

A simple random sample of 1,000 was drawn from the list of nonresidents who purchased an Alaska hunting license in 1991.

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

A steering committee consisting of a representative from each contributing agency was formed in September, 1991. The purpose of the committee was to identify the economic and public opinion information needs of each agency, to assist in designing the questionnaires to be used in the mail surveys, and to pretest draft questionnaires by holding focus groups. Dr. Richard C. Bishop and Dr. Thomas A. Heberlein from the University of Wisconsin assisted the steering committee and the authors in developing questionnaires which would result in providing the information needs identified by the committee.

The questionnaires were designed to estimate the following:

1. the number of trips that each user group took during 1991 to pursue wildlife related activities;
2. the impact of those trips on the state and regional economies;
3. the economic value that users placed on those trips;
4. the demographic characteristics of each user group; and
5. the attitudes, opinions, and knowledge of each user group about wildlife and wildlife management.

Draft questionnaires were developed and pretested in a total of 19 focus groups consisting of from 6 to 15 participants. A total of 156 draft questionnaires were completed by focus group participants and were analyzed to identify questionnaire problems. The final questionnaires consisted of a combination of public opinion, demographic, and economic questions. A copy of the questionnaire is presented in Part B of each report covering the results from each user group. The questionnaires took respondents from 25 to 30 minutes to complete.

The mail surveys consisted of four separate mailings to each group:

1. an introductory letter was sent to all persons drawn in the samples explaining that the person had been selected to participate and requesting their cooperation;
2. a copy of the questionnaire was sent to all persons who did not have their introductory letters returned by the Post Office as undeliverable;
3. a second copy of the questionnaire was sent to all persons who did not respond to the first questionnaire; and
4. a third copy of the questionnaire was sent to all persons who did not respond to either the first or second questionnaire.

The mailing schedule and results are summarized in Table 1.

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

TABLE 1. Mailing schedule and questionnaire returns

DATE	ITEM AND NUMBER SENT	NUMBER RETURNED
March 6, 1992	Introductory letters 4,000 Alaska hunters 4,725 Alaska voters 1,000 nonresident hunters	Undeliverable letters 454 Alaska hunters 584 Alaska voters 118 nonresident hunters
March 23, 1992	First questionnaires 3,546 Alaska hunters 4,141 Alaska voters 882 nonresident hunters	First questionnaires 1,477 Alaska hunters 1,554 Alaska voters 397 nonresident hunters
April 20, 1992	Second questionnaires 2,069 Alaska hunters 2,587 Alaska voters 485 nonresident hunters	Second questionnaires 391 Alaska hunters 539 Alaska voters 184 nonresident hunters
May 18, 1992	Third questionnaires 1,678 Alaska hunters 2,048 Alaska voters 301 nonresident hunters	Third questionnaires 209 Alaska hunters 277 Alaska voters 66 nonresident hunters
		Total questionnaires 2,077 Alaska hunters 2,370 Alaska voters 647 nonresident hunters

Nonresident hunters had the highest response rate with 73.4% of those who received a questionnaire responding; resident hunters had the second highest response rate with 58.6% responding; and Alaska voters had the lowest response rate of 57.2%.

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

SURVEY RESULTS

The returned questionnaires from each survey were compared to the original sampling frames to test for response bias. The known gender, age and legislative district of the returns from the Alaska voters were compared to those from the entire population of 1990 voters. The known gender and age of resident and nonresident hunters were compared to those from the entire populations of 1991 resident and nonresident hunters respectively. The location of residence for hunters was not compared because only mailing addresses were available on the hunting license files. In Alaska, unlike other parts of the U.S., mailing address is not a reliable indicator of where a person actually resides. Using a significance level of .05, statistical differences were found between returned questionnaires and the sample population of Alaska voters with regard to legislative district, of resident hunters with regard to age, and of nonresident hunters with regard to both gender and age. Weights were calculated for each factor for each sample to remove response bias based on those characteristics and to retain the original sample size to ensure the validity of statistical results. The results of the comparisons and the corresponding weights are presented in Tables 2, 3, and 4.

The results from each user/activity group are presented in two separate reports: Characteristics and Attitudes Towards Wildlife, and Trip Characteristics and Economics, for a total of six reports:

Alaska Voters: Their Characteristics and Attitudes Towards Wildlife

Alaska Voters: Their Wildlife Viewing Trip Characteristics and Economics

Alaska Hunters: Their Characteristics and Attitudes Towards Wildlife

Alaska Hunters: Their Hunting Trip Characteristics and Economics

Alaska Nonresident Hunters: Their Characteristics and Attitudes Towards Wildlife

Alaska Nonresident Hunters: Their Hunting Trip Characteristics and Economics

All six reports are very detailed and intended to be used as reference documents by the cooperating agencies. The responses to each question in each questionnaire are analyzed by demographic features of the respondents. Those features are:

ALASKA VOTERS

- gender
- age
- location of residence
- education
- income
- race
- years living in Alaska
- history of hunting
- history of wildlife viewing

ALASKA HUNTERS

- gender
- age
- location of residence
- education
- income
- race
- years living in Alaska
- history of completing a hunter education class

NONRESIDENT HUNTERS

- gender
- age
- education
- income
- race
- history of completing a hunter education class
- use of a hunting guide
- location of hunting trip
- species hunted
- species bagged

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

One of the demographic factors used in analyzing the results of both the public opinion and economic data is the location of respondents' residences and their hunting or wildlife viewing activities. In all six reports location is identified by geographic region. Five regions are defined on the basis of Alaska Department of Fish and Game's Game Management Units. Table 5 gives the regional designation for each Game Management Unit. These regions were designed to correspond with regions used by the Alaska Visitor Statistics Program of the Alaska Department of Commerce and Economic Development, Division of Tourism. The regions generally correspond to the regions used by the Division of Wildlife Conservation of the Alaska Department of Fish and Game, with one exception. The Division of Wildlife Conservation does not recognize Region 4, and considers it part of Region 2.

TABLE 5. Region Definitions

REGION 1	REGION 2	REGION 3	REGION 4	REGION 5

	GMU 16	GMU 26B		
		GMU 26C		

Part A of each of the six reports presents summary tables for the breakdown of responses by demographic features for each individual question. Most of the summary tables are of two basic types:

Pearson Chi-squared Tables

A table presenting the Pearson Chi-squared statistic, the degrees of freedom, and the observed significance level of the test for independence between the responses to the question and the various categories or levels of each demographic factor is presented first.

In addition to the demographic features, question responses are tested for independence between "mailings when the response was received". In mail questionnaires, there is often a response bias associated with when the questionnaire was returned by the respondent. Respondents who return their questionnaires after receiving the first questionnaire may have different characteristics, attitudes, and spending habits than those who returned their questionnaires after receiving one or two reminder questionnaires. Such differences indicate that it would not be valid to assume that the surveys' results could be applied to those people who received a questionnaire but failed to respond. This bias may be specific to individual questions in the questionnaires. To examine the

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

possibility of this type of bias, each individual question within each questionnaire was analyzed to identify statistically significant differences between the responses received after each mailing. For those questions where a statistically significant difference exists between the mailings when the responses were received, care must be taken in expanding the results to the population from which the samples were drawn.

Over 2,000 significance tests were calculated over all three surveys. If an observed significance level of .05 is used to reject the null hypothesis of independence, and conclude that statistically significant differences exist between the demographic categories, then we could expect to be wrong in our conclusions about 5 times in 100. This means that we would be wrong about 100 times over all three surveys.

Breakdown Tables

Summary tables which breakdown or cross the responses to the individual question with each of the demographic factors follow the Pearson Chi-squared Table. The breakdown tables present the percentages of the weighted responses that are in each category of response to the question for each category of the demographic factors. Since the percentages are weighted, they can be used as population estimates for each respective sample frame within the guidelines discussed in the previous section regarding response bias. The reliability of the percentages presented in the summary tables depends on the sample size and the magnitude of the percentage. Survey results close to 50% are the least reliable; results around 1% or 99% are the most reliable. Larger samples provide greater reliability than smaller samples. Table 6 summarizes the reliability intervals at the 95% confidence for each of the three surveys.

TABLE 6. Survey Reliability Intervals: 95% Confidence Level			
	VOTER SURVEY SAMPLE SIZE 2370	RESIDENT HUNTER SURVEY SAMPLE SIZE 2077	NONRESIDENT HUNTER SURVEY SAMPLE SIZE 647
WHEN SURVEY RESULT IS:	THEN MAXIMUM MARGIN OF ERROR IS:		
1% OR 99%	0.4%	0.4%	0.8%
10% OR 90%	1.2%	1.3%	2.3%
20% OR 80%	1.6%	1.7%	3.1%
30% OR 70%	1.8%	2.0%	3.5%
40% OR 60%	2.0%	2.1%	3.8%
50% OR 50%	2.0%	2.2%	3.9%

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

Most of the questions required unique answers. That is, each respondent chose one answer among a number of possibilities. However, several questions allowed respondents to provide more than one response. For example, hunters could list more than one species when asked which species they were hunting. The summary tables for questions with multiple responses are identified as such and do not display totals.

The unit of analysis for all the public opinion and demographic data is the individual respondent and all respondents are included. Missing responses to individual questions are identified. The unit of analysis for trip characteristics and economic activities varies between the individual respondent with all responses included, a subset of respondents who indicated that they have participated in wildlife-related activities, and randomly selected wildlife-related overnight trips taken in 1991. The overnight trips in the nonresident hunters survey were selected by having respondents identify their longest overnight hunting trip in Alaska. This was appropriate because most nonresident hunter only make one overnight hunting trip per year. However, resident hunters and wildlife viewers may make many overnight trips. The overnight trips taken by residents were selected by having respondents first list their wildlife viewing or hunting trips in a table. From the table, the respondents were directed through a series of instructions which resulted in one of their trips being selected. They were then asked a series of questions regarding their economic activities and the characteristics of their selected trip. All returned questionnaires were reviewed to ensure that only those trips that were correctly identified through the random selection process were considered in the analyses. The reader can refer to the questionnaire in Part B of each report to review the exact mechanism used to randomly select overnight trips.

ACKNOWLEDGEMENTS

Many people worked long and hard to make this project a reality. The project steering committee members, Mr. William Martin of the Federal Aid Program of the U. S. Fish and Wildlife Service, Mr. Robert Dewey of the U. S. D. A. Forest Service, Alaska Region, Ms. Sue Mills and Mr. Doug Whittaker of the National Park Service, Mr. John Thompson of the Bureau of Land Management, Dr. John Schoen and Ms. Lana Shea of the Alaska Department of Fish and Game, and Dr. John Boyce of the University of Alaska, Fairbanks, all dedicated considerable time and effort to project design. Dr. Erda Wang and Ms. Michelle Haefele, of Colorado State University assisted in analyzing the economic data. The entire staff of the Information Management Program of the Division of Wildlife Conservation, Alaska Department of Fish and Game made the whole project possible by their exceptional abilities and willingness to put forth whatever effort necessary to execute all phases of the project. Staff members include Mr. Bob Walker, Ms. Tammy Wettin, Ms. Rhonda Zak, Ms. Rebecca Strauch, Mr. Earl Becker, Mr. Randy Kardong, Ms. Teri Arnold, Ms. Lynn Dang, Ms. Ruth Moulton, Ms. Suzan Bowan, and student interns, Mr. Michael Schmahl, Mr. Jeffrey Sabrowski, Ms. Edith Jones, Ms. Kynda Curtis, and Ms. Jennifer Raley. Mr. Larry Aumiller created original drawings for the covers of each questionnaire. Ms. Sheryl Jamieson provided clerical support.

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

Characteristics of Primary Big Game Hunting Trips

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics****A Brief Summary of Characteristics of Primary Big Game Hunting Trips to Alaska**

The Nonresident Hunter sample consists of 647 nonresident individuals who purchased hunting licenses in Alaska during 1991. As explained in the Introduction, the nonresident hunter sample was weighted by sex and age to make it more representative of the nonresident hunter population. A few hunters (3.0%) reported taking 0 big game hunting trips in Alaska in 1991 (Table A-1). About half of those are "missing" responses to that particular question. Responses to other questions indicate they actually did take a big game hunting trip in Alaska during 1991--though most of them were secondary hunting trips. Hence, about 1.5% of those purchasing a nonresident hunting license appear not to have actually taken a big game hunting trip in Alaska during 1991. A few hunters (4.3% of the sample) reported taking more than one big game hunting trip to Alaska during 1991. Summing the number of trips over the entire sample results in a total of 662 big game hunting trips taken by our sample of 647 nonresident hunters. Inflating that number of total trips to represent the population of nonresident hunters (by multiplying by 10.833, which is the total number of nonresidents purchasing Alaska hunting licenses (7,009) divided by our sample of 647) implies a total of 7,171 big game hunting trips taken in Alaska by nonresident hunters in 1991.

Hunters were asked to provide detailed information about their Alaska big game hunting trip. Those who took more than one trip were asked to tell us about their "LONGEST ALASKA HUNTING TRIP." That designation was used throughout the questionnaire to refer to the specific trip about which respondents were providing information, whether the respondent took one trip or more than one trip. (In this report we will use the terms "Longest Alaska Hunting Trip" and "Selected Trip" interchangeably.) The result of the information provided by respondents was detailed information about big game hunting trips that could be considered a random sample of all big game hunting trips taken by nonresidents. Some 86% of the respondents said hunting was the primary purpose for their LONGEST ALASKA HUNTING TRIP. Because it is not clear how much of the value of trips for which hunting was a secondary purpose can be attributed to hunting, we will focus on primary big game hunting trips. We assume that the trip would not have been taken had big game hunting not been available, and therefore we attribute all the trip value to big game hunting. The usable subsample of primary trips consists of 551 trips before weighting (about 548 after weighting). We estimate a total of 6,167 primary big game hunting trips by nonresidents in 1991 (86% of 7,171).

Frequency distributions of number of big game hunting trips in Alaska are shown in Tables A-1, broken down by several characteristics of respondents. Because of the large amount of information and detail in each of the tables, our discussion will only skim the surface. This report is intended to be a reference document and readers are encouraged to spend time studying the tables, along with the Pearson chi-square results presented before each series of tables, on any breakdowns in which they are interested. With that, some explanation of how to read the tables is in order. First, consider the Pearson chi-square tests for "number of big game hunting trips to Alaska in 1991." The null hypothesis for the chi-square test is that the two variables are independent. The calculated chi-square statistics are shown under the heading "Value," the degrees of freedom for the chi-square test are shown under "DF." The last column, titled "Significance," shows the observed significance levels of the tests. Those levels represent the probability that a random sample would result in a chi-square statistic of at least the magnitude calculated. If that probability is small enough (we will use the .05 level), the hypothesis that the two variables are independent is rejected. The first test shown is of the variables TRIPS (number of big game hunting trips to Alaska) and MAILING (whether the respondent responded to the first, second, or third mailing). The calculated chi-square statistic is 9.07732 with 8 degrees of freedom. That test results in a significance level of .33582. That does not meet our criterion of .05 (.33582 is greater than .05); so we cannot reject the null hypothesis of independence. We conclude that the number of big game hunting trips by respondents does not differ significantly between people who responded to the different mailings. Further down that table of chi-square tests is the test of TRIPS and whether the respondent hunted in Alaska before 1991. The calculated chi-square statistic for that test is 15.19350 with 4 degrees of freedom and a significance level of .00432. That test does meet our .05 criterion (.00432 is less than .05). We reject the null hypothesis of independence and conclude that the number of big game hunting trips to Alaska in 1991 differs significantly between respondents who hunted in Alaska before 1991 and those who did not.

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

Moving on to the frequency breakdown tables, the first of the A-1 tables shows the distribution of the number of big game hunting trips broken down by gender and age category of respondent. The first column, labelled TOTAL, shows the distribution of number of big game hunting trips for the complete weighted sample. Going down that column: 3.0% of the sample took 0 big game hunting trips in Alaska in 1991 (but remember about half of those actually did take trips based on responses to other questions), 92.7% took 1 big game hunting trip, 3.9% of the sample took 2 big game hunting trips to Alaska, etc. down to 0.1% of the sample taking 6 big game hunting trips to Alaska in 1991. The next 2 and 7 columns show the distribution of number of big game hunting trips broken down by gender and age category of respondent, respectively. Looking at column percentages: 92.5% of the males and 100.0% of the females in the sample took 1 big game hunting trip to Alaska in 1991, 4.0% of the males and 0% of the females took 2 overnight hunting trips, and so on. Looking at the 31-40 years of age column: 94.5% of respondents aged 31-40 took 1 big game hunting trip to Alaska in 1991, 3.2% of those aged 31-40 took 2 big game hunting trips, etc.

Row percentages refer to breakdowns going across rows of the table. Of respondents taking 1 big game hunting trip to Alaska in 1991: 97.4% were male and 2.6% were female; 2.2% of respondents taking 1 big game hunting trip to Alaska in 1991 were in the under 21 age category, 11.7% of those taking 1 big game hunting trip were aged 21-30, 29.1% were aged 31-40, 29.7% were aged 41-50, 18.2% were aged 51-60 and 9.0% of those taking 1 big game hunting trip to Alaska in 1991 were over 60 years old. The row labelled TOTAL shows the demographic breakdown for the complete sample. Of our sample, 97.6% were male and 2.4% were female. The age breakdown of our sample was: 2.0% under 21, 11.4% aged 21-30, 28.6% aged 31-40, 30.3% aged 41-50, 18.1% aged 51-60, and 9.5% of our total sample were over 60 years old. The last row of the table shows summary statistics for each breakdown. For the TOTAL sample column, the mean number of big game hunting trips to Alaska in 1991 was 1.02 with a standard error of 0.01, the median number of big game hunting trips was 1, the standard deviation of number of big game hunting trips for our sample was 0.34, and the number of nonmissing cases on which the statistics were based was 647. (The number of nonmissing cases may not always be a whole number because of the weights that were applied. Additionally, there could be some rounding error when means and sample sizes, as shown on these tables, are used to calculate total numbers for various breakdowns. When we give totals in this report, we calculated them with a little more accuracy than is shown on the tables.) Because we are giving the summary statistics, it is important to show the sample sizes on which they were based to give readers an indication of how robust they might be. For respondents over age 60: the mean number of big game hunting trips to Alaska was 0.91 with a standard error of 0.04, the median was 1, standard deviation was 0.34 and there were about 62 people in that age group.

From the distribution for the total sample in Tables A-1 we calculated a weighted total of 662 big game hunting trips to Alaska taken by 628 individuals in the total Nonresident Hunter sample, of which 569 (86%) were for the primary purpose of hunting big game. Expanded to the total Nonresident Hunter population, we estimate that 7,171 big game hunting trips were taken by 6,803 individuals on which hunting big game was one of the purposes of the trip. An estimated 6,167 (86%) of those trips were primary purpose big game hunting trips.

To illustrate the rounding error mentioned above, if one were to calculate the total number of big game hunting trips in our sample by multiplying the mean of 1.02 by the number of nonmissing cases shown in the table (647) one would estimate about 660 big game hunting trips. Our estimate of 662 trips in the sample was based on the more accurate mean of 1.023. With that in mind and recognizing that the results are approximations, readers can make many such calculations throughout this report.

In many of the tables one of the breakdown variables is called "Importance of Bagging to Trip Success." That variable is from the question (#12) in Part 2 of the survey: "How important to the success of your trip do you consider bagging whatever game you are hunting?" Another breakdown variable is called "Contribution of Wildlife Viewing to Trip." That variable is from the question (#20): "To what extent did wildlife viewing contribute to the enjoyment of your LONGEST ALASKA HUNTING TRIP?" The breakdown variable "Comparison: Hunting in Alaska to Other Places Hunted" comes from the question

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

(#5 in Part 1 of the questionnaire) "In general, how does big game hunting in Alaska compare to big game hunting in the best places you have hunted big game?" Finally the breakdown "Used Guide" comes from the question (#5 in Part 2) asking where respondents hunted, the target species, and whether they used a guide on any part of their trip. These variables were used as breakdowns in reporting trip characteristics and economics because they were thought to be indicative of different motivations for hunting, the perceived relationship between hunting and wildlife viewing, or of different types of hunts or hunters. As such it was thought they might convey useful information to managers about the publics they dealt with on various issues. Notice the breakdown labelled "Years Respondent has Hunted in Alaska Before 1991." A value of 0 for that variable indicates that 1991 is the first year the respondent has hunted in Alaska. That is the case for just over half (54.7%) of our sample. The other breakdown variables used in reporting trip characteristics and economics are self explanatory, and all come from the survey instrument presented in Section B of this report.

Tables A-2 to A-10 present information about respondents' "Longest Alaska Hunting Trip." That was the designation for the randomly selected trip about which respondents provided detailed information. Tables A-2 (we refer to Tables A-2 in the plural because the table is composed of several demographic and characteristic breakdown tables) show the trip destination region broken down by characteristics of respondents. Regions 2 and 3, South Central and Interior Alaska, were the most popular trip destinations, accounting for about 65% of the primary trips between them--37.5% to South Central and 27.7% to Interior Alaska. Most of the trips involved a single region. Trips combining Regions 2 and 3 accounted for 2.6% of the trips, with all other combinations accounting for only 1.5%. Tables A-3 show the wildlife species targeted on the primary purpose big game hunting trips--those species respondents reported as the species hunted. The most commonly mentioned species was caribou (targeted on 49.4% of primary trips). Moose (37.6% of trips), brown bear (20.5% of trips), black bear (14.5%), and sheep (11.1%) were the next most commonly targeted species. Because hunters could target more than one species, column percentages do not sum to 100%. The last row in Tables A-3 refers to all primary trips, rather than being a summation of all previous rows in the table. Tables A-4 give the distribution of species bagged on primary big game hunting trips. Again, multiple responses were possible so column percents do not sum to 100. Not surprisingly, species bagged follows the pattern seen in species targeted. Caribou (bagged on 52.6% of big game hunting trips), moose (21.4%), brown bear (17.5%), black bear (8.3%), and sheep (10.8% of trips) were the most commonly bagged species.

Tables A-5 and A-6 indicate that the average primary purpose big game hunting trip consisted of 2.99 hunters in the party and 12.95 nights in Alaska (which we interpret to be about a 14 day trip). Hunters spent all or part of the day actually hunting on an average of 7.59 days of their trip (Tables A-7), and on those days spent an average of 9.09 hours actually hunting (Tables A-8). The most common month in which a primary big game hunting trip was started was September (48.3% of primary big game hunting trips), followed by August (21.5%), October (10.6%), and May (7.0%) as shown in Tables A-9. Tables A-10 show the other activities in which respondents participated while on their primary big game hunting trip. Hunters responded that they just hunted on only 11.8% of the big game hunting trips. On 64.5% of the trips, hunters viewed or photographed wildlife. The next most common other activities were fishing (53.7% of the trips), camping (51.0% of the trips), and visiting friends or relatives (33.0% of the trips). As with species targeted and species bagged, multiple responses were possible so column percents do not sum to 100, and the last row refers to all primary trips and not to the summation of all previous rows. Tables A-10 also show the other activities by species targeted, as an indicator of type of hunting trip.

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

(#5 in Part 1 of the questionnaire) "In general, how does big game hunting in Alaska compare to big game hunting in the best places you have hunted big game?" Finally the breakdown "Used Guide" comes from the question (#5 in Part 2) asking where respondents hunted, the target species, and whether they used a guide on any part of their trip. These variables were used as breakdowns in reporting trip characteristics and economics because they were thought to be indicative of different motivations for hunting, the perceived relationship between hunting and wildlife viewing, or of different types of hunts or hunters. As such it was thought they might convey useful information to managers about the publics they dealt with on various issues. Notice the breakdown labelled "Years Respondent has Hunted in Alaska Before 1991." A value of 0 for that variable indicates that 1991 is the first year the respondent has hunted in Alaska. That is the case for just over half (54.7%) of our sample. Nonresident Hunters: Their Hunting Trip Characteristics and Economics

**The Net Economic Value of
Primary Big Game Hunting Trips**

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics****A Brief Summary of Net Economic Value Related to Primary Big Game Hunting Trips to Alaska**

As discussed by McCollum et al. (1992), the correct concept of value in cases where goods are not efficiently price rationed, i.e., where price alone does not control access to the good, is average consumer surplus. That is exactly the case for goods not traded in markets such as wildlife and outdoor recreation. Consumer surplus measures an individual's willingness to pay for a good or service above and beyond the cost of obtaining the good or service. It reflects the net value placed on the good or the net benefit derived from consuming the good. Consider the following illustration of consumer surplus. Suppose an individual receives \$1,000 worth of benefit from hunting brown bear. If she has to pay up to \$1,000 to hunt brown bear, she feels she got her money's worth from the experience. If she has to pay \$1,001, though, she feels that is too much, and she will not hunt. Thus, \$1,000 is the gross value of brown bear hunting to this individual. Suppose the individual is offered an opportunity to hunt brown bear for \$200. She still gets \$1,000 worth of benefit from the experience even though she pays only \$200. Looking only at the price of the brown bear hunt, one would conclude that the value of brown bear hunting to the individual is \$200. But we know that the individual is willing to pay up to \$1,000 to hunt brown bear. She is getting a bargain, \$1,000 worth of benefit for only \$200. She receives a net value, or consumer surplus, of \$800--\$800 worth of benefit that she doesn't have to pay for, that does not show up in any market transaction. If a resource manager looked only at the market transaction, or price, he or she would have undervalued the individual's brown bear hunting experience by \$800.

Consumer surplus tells us the net value of a nonmarket good or service--the net benefit received. It is not the amount currently captured in any economic transaction, though in theory it could be captured as discussed by Loomis and Thomas (1992). It is the appropriate value for benefit-cost analysis.

Tables A-11 through A-14 focus on the net economic value, or net benefit, received by hunters from their Selected Trip. Tables A-11 indicate that 76.0% of the respondents felt their trip was worth the money they paid--if they had it to do over, they would take the same trip for the same amount of money. That implies they received net benefit greater than or equal to zero--the trip was not a disbenefit. Tables A-12 present the distribution of net values (over and above the cost of their trip) that respondents placed on their trip broken down by several characteristics. The average net value was \$440, with a median value of 0. On average, nonresident hunters would have been willing to pay \$440 more in costs to take their Longest Alaska Hunting Trip. The survey provided some explanation of why some respondents chose to put a zero net value on their trip. Twenty-four percent of the respondents said their trip was not worth the money they paid (from Tables A-11); for those hunters, net value was 0 by definition. Of those who said their trip was worth at least as much as they paid and chose to put a net value of 0 on their trip, some indicated the trip was worth exactly what they paid and no more--a true zero net value. Others indicated they responded 0 because they could not put a number on their net value. For those latter cases, the true value may be greater than zero, but a conservative approach is to regard them as zero.

Tables A-13 show the statewide distribution of respondents' net economic value broken by wildlife species targeted, wildlife species bagged, trophy species bagged, species hunted for the first time, and species bagged for the first time. In terms of species targeted, trips on which brown bear (at \$606), sheep (at \$492), and waterfowl (at \$473) were targeted appear to be higher valued than trips on which they were not. One must be careful, however, to consider the sample size on which the estimates are based--the value of trips on which waterfowl were targeted was based on only about 8 observations. Trips on which caribou were targeted were valued (\$432) at about the overall trip average for all species (which was \$440). Trips on which goats (\$419), moose (\$393), black bear (\$366), are wolf (\$351) were targeted were valued somewhat below the overall trip average of \$440--though goats and wolves were based on small samples. Trips targeting deer (\$222) and elk (\$88) were both well below the overall average (and based on small samples). In terms of species bagged on the trip, trips on which any species except deer, elk, and waterfowl were bagged were valued above the overall trip mean of \$440. Wolves (\$1,230, but only 4 trips), brown bears (\$751), sheep (\$662), and black bears (\$618) appear to be the most highly valued species to bag. Again, keep in mind the number of nonmissing cases on

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

which the averages were based. Tables A-13 also present a breakdown of net value by trophy species bagged by respondent. The definition of "trophy" is left solely to the respondent and there are not a lot of observations for any species, but a couple of speculations can be made. Trophy quality brown bears and black bears appear to be more valuable than nontrophy bears (\$856 compared to \$751 for brown bears and \$716 compared to \$618 for black bears). Trophy sheep appear to be worth a little less than nontrophy sheep (\$638 compared to \$662). Similar patterns appear for moose (\$482 compared to \$508) and caribou (\$391 compared to \$472). One explanation for the latter set of observations could be that the hunts which resulted in trophy animals cost more than those on which nontrophy animals were bagged. Since these values are net values (over and above cost of the trip), total value could be higher for the trophy animals but by an amount less than the increase in trip cost. But, that is only speculation.

Hunting the species for the first time appears to add some value to the trip when caribou or moose are targeted (\$463 for first time caribou hunters compared to \$432 for all caribou hunters, and \$406 compared to \$393 for moose hunters). First time hunters place a little lower net value on their trip than do all hunters when brown bears (\$592 compared to \$606), sheep (\$463 compared to \$492), and black bears (\$268 compared to \$366). Bagging a species for the first time appears to add value to the trip beyond that for all trips on which the species is bagged only for moose (\$653 compared to \$508). Trips on which brown bear were bagged for the first time appear to be valued about the same as all trips on which brown bear were bagged (\$748 compared to \$751). Trips on which caribou, sheep, and black bears were bagged for the first time appear to be valued somewhat less than all trips on which those species were bagged.

With all the values related to species, one must be very aware of the sample sizes on which they were based. That is especially true for the breakdown by trophy species. Another caveat is that while an observation that trips on which a particular species was targeted or bagged are valued higher than other trips is one indication that the species might be more highly valued than other species, the difference in value between a trip on which a particular species was targeted or bagged and trips on which it was not is not solely attributable to that species. (And likewise for bagging a trophy animal or hunting/bagging an animal for the first time.) Many of these hunting trips involved more than one species and different combinations of site/trip attributes. More work remains to be done to clarify relative values between species, but trip values on which particular species were targeted or bagged can be used as one indication of relative value.

Tables A-14 present the same information as Tables A-13 broken down by Region. Average values for all trips--all species combined--to the different regions are given in the breakdown table of net economic value by trip destination region, in Tables A-12. In comparing trip values by species targeted or species bagged for particular regions, it is even more important to pay attention to the sample sizes. Many region and species combinations have fewer than 5 trips on which the statistics were based, so the statistics are less than robust to say the least. In Region 1, for example, only trips targeting brown bear and black bear were based on more than 10 trips. The sample sizes in Regions 2 and 3 are larger, but for many species they are still small. Sample sizes in Regions 4 and 5 are smaller than that in Region 1. In using the values, one must recognize their statistical limitations.

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

**Expenditures and Economic Impact Directly
Attributable to Big Game Hunting**

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics****A Brief Summary of Expenditures and Economic Impact
Directly Attributable to Big Game Hunting by Nonresidents**

In contrast to net economic value, or consumer surplus, economic impact measures market transactions related to a particular good, service, or activity. Whereas consumer surplus measures value net of expenditures, economic impact measures all transactions related to or stimulated by the expenditures made for the good or activity. Note, at the outset, that it is not correct to add consumer surplus and economic impact and call their sum total value of the activity. Economic impact analysis by its nature contains double counting. The purpose of economic impact analysis is to measure all market transactions related to an activity. To the extent that goods are bought and sold more than once, it is appropriate to count them more than once.

When a good or service is purchased from a retailer, the retailer keeps some of the money as profit and uses the rest to pay workers and other business expenses, and to buy more goods to sell. The retailer buys from a wholesaler who uses the proceeds to pay his workers and costs of doing business, and to buy more goods from manufacturers. Manufacturers pay workers and buy inputs to produce more goods. Each sale--consumers buying from retailers, retailers buying from wholesalers, wholesalers buying from manufacturers, and manufacturers buying inputs from other industries--constitutes a valid transaction and is appropriately counted in the economic impact stimulated by the purchase made by a final consumer. Also counted in the impact stimulated by the consumer's purchase are economic transactions made by workers with wages supported by the final consumer's purchase. That is, the workers who manufacture the good, the workers who transport the good to market, and the workers who sell the good are all paid wages. They, in turn, buy goods and services which transactions are also attributable to the final consumer's purchase. The sum of all those transactions is equal to the economic activity generated by the purchase of the good but is much more than the actual expenditure by the final consumer, and may be more than the value the final consumer places on the good. When the purchase of the good by the final consumer is motivated by an activity such as wildlife viewing, all those economic transactions are attributable to wildlife viewing. The purpose of economic impact analysis is neither to measure the economic value of an activity nor to measure expenditures resulting directly from an activity. Its purpose is to track and measure economic transactions stimulated by an activity as those expenditures flow through the economy.

What, then, do the results of an economic impact analysis reveal? They reveal the amount of economic transactions supported by an activity. They can also reveal the number of jobs supported by those economic transactions. By comparison to the base or total economy, the proportion of total transactions or jobs in the economy attributable to or supported by the activity being studied can be estimated. If expenditures directly related to an activity were hypothesized to increase or decrease by some amount, an economic impact analysis could estimate the change in total economic transactions throughout the economy.

One component of economic impact attributable to hunting is equipment and supplies bought related to hunting, but not attributable to any particular trip. The questionnaire obtained information on those types of expenditures (made in Alaska) from everyone in the sample. Because our sample of 647 is representative (after weighting) of all nonresident hunters, we can estimate total annual expenditures for the population based on our sample. This was done by inflating the equipment and supplies expenditures by our sample by a factor of 10.833 to inflate from our sample of 647 to the population of 7,009 nonresident hunters. Information about equipment and supplies purchased by our respondents is presented in Tables A-15, broken down by several of respondents and trips, and A-16, broken down by expenditure category. The per capita annual expenditure on equipment in Alaska by nonresident hunters, not attributable to any particular trip was \$43.28 (Tables A-15). The estimated annual expenditures in Alaska on equipment related to hunting by nonresidents was \$303,357 in 1991 (Table A-16). Those equipment and supply purchases were made by all nonresident hunters--those who took primary big game hunting trips plus those who only took secondary trips or day trips and some who may have taken no trips at all in 1991. Tables A-17 present the equipment expenditures broken down by expenditure category for each of the 5 regions in the state. The regional totals do not add up to the statewide total because some respondents only told us their purchases were made in Alaska without specifically telling us where in Alaska.

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

To estimate the total economic impact of primary purpose big game hunting trips by nonresidents, we used the detailed information on expenditures for the "Longest Alaska Hunting Trip" or "Selected Trip" from the survey. To the best of respondents' recollection, those are all the expenditures they made while they were on their Selected Trip. We first inflated the trip expenditure data by a factor of 1.046 (569 primary trips estimated for the entire nonresident hunter sample divided by 544 trips in our random subsample of primary purpose big game hunting trips--544 respondents gave us information on trip expenditures while 551 responded to the questions on trip attributes and characteristics) to estimate trip expenditures for all overnight primary purpose big game hunting trips taken by our total nonresident hunter sample. To estimate trip expenditures for all primary purpose big game hunting trips in Alaska by all nonresident hunters, we further inflated the trip expenditure data by a factor of 10.833 (7,009 nonresident hunters in the state divided by 647 in our sample). Hence, the data in our detailed trip information was inflated by a factor of 11.331 to estimate trip expenditures for all primary purpose big game hunting trips in Alaska by nonresident hunters in 1991.

Information about respondents' total trip expenditures related to their "Selected Trips" is presented in Tables A-18, broken down by several characteristics. Tables A-19 present the same breakdowns for those trip related expenditures actually made in Alaska. Table A-20 shows the trip expenditures made in Alaska broken down by expenditure category. The average total expenditure related to primary purpose big game hunting trips was \$6,331, though some expenditures were outside Alaska (Tables A-18). The average trip related expenditure in Alaska on a primary purpose big game hunting trip was \$3,895 (Table A-19). The Alaskan economy captures about 61% of the trip-related expenditures by nonresident big game hunters. Expenditures in Alaska related to primary big game hunting trips by nonresidents amounted to \$24.2 million in 1991. The average expenditure of \$3,923.95 shown in Table A-20 differs slightly (by 0.7%) from the \$3,894.96 average shown in Tables A-19. That is due to a slight difference in the ways the weights were applied in tabulating the frequencies and estimating the economic impacts. Both numbers are estimates and the difference is inconsequential. Tables A-21 present trip related expenditures in each of the 5 regions of the state. Again, the regional totals do not add up to the statewide total because some respondents only told us that their purchases were made in Alaska without telling us where in Alaska.

A few words are in order to help understand and interpret the economic impact tables (A-22 to A-24). "Final demand" refers to purchases of goods and services by households and other final consumers of goods and services. It does not include purchases by industries for use as intermediate goods or services, i.e., to be used as inputs in another industry's production of goods and services. "Total industry output" (TIO) includes both output consumed as final demand and output used as intermediate products by other industries. Hence, TIO is Final Demand plus demand by industries for use as inputs to their production processes. "Direct effect" refers to the initial expenditure on goods and services related to hunting. All the expenditures reported in the nonresident hunter survey contribute to the direct effect, because they are expenditures made by people related to hunting. Note that direct effect does not equal the sum of all the expenditures reported in Tables A-15 to A-21. It is close to the sum of expenditures, however.¹ Because direct effects are the first round of expenditures and are assumed to be made by final consumers, all demand is final demand so total industry output is equal to final demand in the direct effects. "Indirect effect" refers to changes in production within industries necessitated by the direct effects. In order to sell the output demanded and purchased by hunters, industries need to purchase inputs and employ workers to produce those goods and services. All indirect effects are composed of consumption by industries for use as intermediate products or inputs. Because of that, final demand in the indirect effects is equal to 0. "Induced effects" are changes in household spending caused by changes in regional employment generated by the direct and indirect effects. Direct and indirect effects require workers to produce and sell the output that is being sold and consumed. Wages and salaries are paid to those workers who, in turn, spend it on goods and services, housing, and the whole variety of goods people buy. The expenditures by those workers make up the induced effect. "Expenditure multipliers" are the ratio of total effect (total effect total industry output) to direct effect. The multiplier estimates the total amount of economic transactions resulting from 1 dollar of direct effect.

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

Table A-22 displays information on the total Alaskan economy for 1990 to give some perspective to the numbers reported in Table A-23 on economic impact. That is, Table A-22 presents information on the total statewide economy--independent of anything to do with hunting. Note that the base economy for the state (and for each region) is expressed in 1990 dollars and the impacts are expressed in 1991 dollars. Our assumption is that the economy did not change much between 1990 and 1991. Table A-23 shows the estimated economic activity attributable to hunting by nonresident hunters. The direct effect of nonresident hunters' expenditures (on equipment and primary big game hunting trips) in Alaska in 1991 was \$22.99 million and the total effect was \$32.36 million, which accounted for 0.1% of the Alaskan economy. Of that \$32.36 million of total effect, \$27.69 million was final demand by consumers and \$4.67 million represented consumption by industry as intermediate products or inputs. That is, nonresident hunters spent \$22.99 million in Alaska in 1991 which resulted in \$32.36 million in total economic activity as it circulated through the Alaskan economy. Nonresident hunters' expenditures supported 536 jobs (0.16% of the jobs in the Alaskan economy). The expenditure multiplier was 1.41. Every dollar spent by nonresident hunters contributed another 41 cents (or 41%) in economic activity in Alaska. Tables A-24 present information on the base economy and economic activity attributable to hunting by nonresidents in each of the 5 regions within Alaska.

The economic impact of nonresident hunters' expenditures carries a slightly different significance than the impact of resident hunters' expenditures in that it represents money coming in from outside the Alaskan economy. To illustrate the difference, consider an extreme--though completely unrealistic--example. If all hunting in Alaska were to stop, the money that Alaska residents spend related to hunting would, in many cases, shift to other expenditures--they might buy a new TV set or go to more movies or take up other hobbies or activities or spend more money at the grocery store. That is, if resident hunters in Alaska did not spend their money on hunting in Alaska they would spend at least part of that money on other things in Alaska. Some hunters (maybe a lot of hunters) might go out of state to hunt; but much of the money would not leave the state, it would merely be shifted to other things within the Alaskan economy and the actual net economic impact of the loss of hunting would be nowhere near the level of economic activity and jobs that the model showed were supported by resident hunters' expenditures in the report on resident hunters. If hunting in Alaska were not available to nonresident hunters, most of that money would be lost to Alaska; that money would never come into the state. Indeed, 86% of our sample said big game hunting was the primary purpose of their trip to Alaska. If hunting were not available, those individuals would not have come to Alaska and none of their money would have been spent in Alaska. If nonresident hunting were not available, the actual impact on the Alaskan economy would be much closer to the numbers reported in Table A-23.

Endnotes

1. There are two reasons for this difference between direct effect and actual expenditures. First, the scenarios (scenarios are explained further in the input-output model appendix for interested readers) we used to incorporate expenditures into the structural model of the economy were set up on a "commodity basis" rather than an "industry basis." That means we do not require the good or service to be produced by the industry into whose primary product it falls. We explicitly allow for "byproducts" (which are goods and services produced by an industry not in the primary industry group for a particular product). An example of byproducts might be a brewery which produces some quantity of bottled water. Bottled water is not the primary product of the brewery, nor are breweries and bottled water manufacturers in the same industry group, so it is considered a byproduct. Using a commodity basis, the model would recognize that some bottled water in a given region could come from the brewery. Using an industry basis, bottled water from a brewery would be ignored. Implicit in that consideration of byproducts, though, is that some commodities might be produced by "nonindustry production," i.e., some commodities may be produced by households or government or some other institution, which would not be picked up by the model as being from any industry. The commodity basis is more realistic than the industry basis, but using it results in some direct effect being lost.

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

Second, some small portion of the expenditures leak out of the regional economy immediately. Examples of such leakage might be wages and profits from guide-outfitters paid to nonresident employees or owners, and federal taxes paid for hunting stamps, etc. Also included in this leakage are commodities attributed to industries not present in the regional economy. This is analogous to imports, the margin taken by local wholesalers or retailers are in the direct effect, but some of the expenditure immediately leaks out of the region. The difference between direct effect and actual expenditure due to this second reason is more pronounced as the scale of the model gets smaller. Therefore, the difference between direct effect and actual expenditures is relatively larger for the regional models than for the statewide model.

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics****Technical Notes on Input-Output Analysis and Models for Interested Readers**

Input-output (IO) analysis shows how the output of each industry in an economy is distributed among other industries and sectors of the economy. At the same time, it shows the inputs each industry uses from other industries and sectors in the economy. The main input-output table, the core of the system, is called the transactions table. The transactions table covers a specific period of time. In this discussion, assume the table covers one year as is commonly the case. Transactions in the table are generally valued in terms of producer's prices as opposed to consumer prices.

Table N-1 (immediately following this appendix) is a hypothetical transactions table, taken from Miernyk's book on input-output analysis. It will be used to illustrate the basic components of an input-output analysis. The rows in the transactions table show the output sold by each industry or sector along the left side of the table to each industry and sector across the top of the table. For example, Industry A sold \$15 million of output to Industry B and \$5 million to Industry E. The columns show the purchases made by each industry or sector along the top of the table from the industries and sectors along the left side. For example, Industry C bought \$7 million of product from Industry B and \$2 million from Industry D. The intersection of a row and column represents intraindustry or intrasector transactions. For example, firms in Industry A transferred \$10 million of goods among themselves, firms in Industry F transferred \$6 million, and there were \$1 million in intragovernmental transfers. Reading across a row shows the amount of output that a particular industry or sector sold to each industry and sector across the top of the table. Reading down a column shows the amount of input that a particular industry or sector purchased from each industry and sector on the left side of the table.

The transactions table is composed of several parts. Rows and columns 1-6 are set off as a block and labelled the processing sector. This part of the table contains the industries in the economy that produce goods and services. Among them would be agriculture, manufacturing industries, utilities, commercial services, wholesale and retail trade, etc. This part of the table is highly simplified. In practice, one would expect this part of the table to contain 50 or more industries. The concepts are the same though. If one understands this table he or she can understand any transactions table.

Rows 7-11 make up the payments sector. Row 7 is gross inventory depletion. That shows the amount of previously accumulated stocks of raw materials, intermediate goods, or finished products used up during the year--the dollar amount that inventories were drawn down. Row 8 is the value of imports purchased by each industry or sector. Row 9 shows payments to the government. These are various taxes and payments that industries or sectors pay to the government. It may simplify one's thinking if these are considered to represent the value of government services received by each industry or sector--the services government sells. Row 9 shows depreciation allowance. Depreciation allowances are set aside by industries, in theory, to approximate the cost of plant and equipment used up in their production of goods and services. Row 10 is households. This row represents the wages, salaries, dividends, interest, and other payments made to households by each industry or sector across the top of the table.

Columns 7-11 make up the final demand sector. This sector is of special importance because it is the autonomous sector. Changes here are transmitted throughout the rest of the table. The transactions that an economic impact analysis tracks through the economy originate in the final demand sector. Column 7 shows gross inventory accumulation. That is the value of additions to inventories held by each industry or sector on the left side of the table. Retailers and wholesalers keep some stock on hand to provide for immediate delivery. Manufacturers keep some of their output on hand for delivery on short notice. Column 7 shows the value of additions made to inventories during the year, regardless of where they are held--at the factory or by retailers or wholesalers. Column 8 shows the value of exports from each industry or sector during the year. (Note that, in regional models, households can export labor services across regional boundaries (likewise, industries can import labor services); and things like management and technical consulting services can be exported or imported.) Column 9 shows the value of government purchases made by all levels of government. The intersection of the government row (9) and column (also 9) shows intragovernmental transfers or transactions. Column 10 shows gross private capital formation. That is the value of sales from each industry or sector on the left side of

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

the table to buyers who use their purchase for private capital formation. All entries in the transactions table except those in column 10 are in the "current account." Column 10 represents all purchases by all buyers for replacement of or addition to plant and equipment, and any other purchases entered in the "capital account." In short, column 10 shows the value of replacements of or additions to the capital stock in the region. Column 11 is households. This column shows the purchase of finished goods and services by their ultimate consumers. When a person buys a candy bar or a washing machine, it shows up in this column.

Row 12, total gross outlays, shows the total value of inputs to each industry and sector across the top of the table. It is the sum of the column entries. The total value of purchases by Industry D is \$39 million, for example. Column 12, total gross output, shows the receipts from all outputs. Input-output is essentially a system of double-entry bookkeeping. Within each industry in the processing sector, all of the receipts from sales are paid out for goods and services purchased from other industries and sectors. Thus, in the processing sector, total gross output equals total gross outlays. That is not true in the remaining rows and columns. There is no reason to expect imports and exports to balance in a given year, or for inventory depletion to equal inventory accumulation. But, the differences must cancel out when we view the economy as a whole. Total output equals total outlay for the economy as a whole.

Some examples might be helpful. Consider the inputs side by looking at Column 3. Industry C purchased inputs worth \$1 million from Industry A, \$7 million from Industry B, transferred \$8 million of goods between themselves (Industry C), purchased \$2 million from Industry D, \$1 million from Industry E, and \$7 million from Industry F. They used \$1 million worth of previously accumulated inventory to produce their output, imported \$3 million worth of inputs, paid \$2 million in taxes and other payments to the government, used up \$1 million worth of plant and equipment in their production process, and bought \$7 million worth of services from households for labor, etc. The total outlay of Industry C is \$40 million.

Next, consider the output side by looking at Row 3. Industry C sold \$7 million worth of goods to Industry A, \$2 million to Industry B, transferred \$8 million of goods among members of Industry C, sold \$1 million to Industry D, \$5 million to Industry E, and \$3 million to Industry F. Output of Industry C was added to inventories in the amount of \$2 million, Industry C exported \$3 million worth of their output, sold \$1 million to the government, Industry C output was used to replace or increase the private capital stock in the amount of \$3 million, and the industry sold \$5 million of output directly to households. The total gross output of Industry C is \$40 million, which is equal to their total gross outlays.

Third, consider Row 8. Imports in the amount of \$2 million were sold to Industry A, \$1 million to Industry B, and \$3 million to Industry C. No imports were sold to Industry D, but \$3 million were sold to Industry E, and \$2 million to Industry F. No imports were added to inventories, no imports were exported, and none were bought by government or added to the private capital stock during the year. Households bought \$2 million worth of imported goods and services. Imports accounted for \$13 million in transactions during the year. Column 8 shows that exports totalled \$23 million, so the economy shows a positive trade balance of \$10 million for the year. These examples should illustrate the workings of the transactions table.

The total output shown in a transactions table is not the same as Gross National Product (GNP) or Gross Regional Product (GRP). Essentially this is because GNP strives to eliminate double counting to arrive at the total value of goods and services produced in a year. Input-output strives to account for all transactions. Some goods and services enter into more than one transaction, and so are counted twice. That is not a problem, as long as one remembers what the numbers mean.

A key point about the transactions table is that it is very flexible. The only rules are that there must be one row for each column in the processing sector, and that, in the processing sector, total outlay equals total output. Industries can be aggregated or disaggregated to suit the analysis. There is an advantage to disaggregation (detailed breakdown of industries and sectors) if the table is used for forecasting. For example, a detailed industrial classification would reveal where bottlenecks might occur during an

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

expansion of production. It might be useful to aggregate sectors when attention is to be focused on a few particular sectors. As a general rule, however, one should strive for maximum disaggregation when constructing the basic transactions table. Industries and sectors can always be aggregated later.

Likewise, sectors can be moved around within the table. For example, activities in the processing sector can be shifted to final demand if one is interested in analyzing the interindustry effects of changes in a particular industry. If one wanted to know how spending on housing construction affected the economy, the housing construction industry could be moved to final demand. Such alterations would depend on the analytical use for which the model is intended. Once a transactions table is built, it can be altered and used for many different analyses.

Generally, "industries" refer to aggregates of firms producing similar products, and "sectors" refer to the kinds of markets that industries serve. Firms are classified into industries on the basis of their principal product, but overlap and byproducts must be taken into consideration when analyzing particular industries. For example, suppose Firm Q manufactures automobiles as its primary product, but also manufactures TV sets and refrigerators, referred to as byproducts. Firm Q would be classified into the auto industry. If the refrigerator industry were being analyzed, however, that portion of Firm Q's activities devoted to the production of refrigerators must be included in the analysis. Overlapping and byproducts can be a problem encountered when one attempts to measure employment or production in individual industries. It also occurs when looking at production in a particular region. More of a given commodity/product might be produced locally than might appear by looking only at the principal industry. Or a product might be produced locally even though the particular principal industry does not appear in the region. Hence, looking only at principal industries is not enough. An example of byproducts might be a brewery which produces some quantity of bottled water. Bottled water is not the primary product of the brewery, nor are breweries and bottled water manufacturers in the same industry group, so bottled water would be considered a byproduct of the brewery. Even though there are no bottled water manufacturers in a given region some bottled water might be produced locally by the brewery. Data on byproducts and overlap are available and generally incorporated into large scale IO models.

Input-output tables generally use the Standard Industrial Classification (SIC) system or the Bureau of Economic Analysis (BEA) Industry Classification System as the basis for aggregation or disaggregation--2-digit SIC industries, 4-digit SIC industries, etc. The SIC codes and BEA codes are related and it is not difficult to crosswalk between them.

After a transactions (or input-output) table has been constructed for a given year, a table of "technical" or "input" coefficients can be developed from it. Input coefficients show the amounts of inputs required from each industry to produce one dollar's worth of output in a given industry. Input coefficients are calculated for processing sector industries only.

Two steps are required to calculate input coefficients. First, gross output is adjusted by subtracting inventory depletion during the period to obtain adjusted gross output. Since gross outlays in the processing sector are equal to gross output in that sector, adjusted gross outputs can be computed by subtracting row 7 from row 12 in Table N-1. Second, all entries in each industry's column (but only those in the processing sector block) are divided by the adjusted gross output of that industry. Table N-2 shows the technical or input coefficients. For example, the adjusted gross output of Industry A is equal to 63 (total gross outlay minus inventory depletion). Each entry in the A column of the processing sector then is divided by 63. Table N-2 shows that each dollar's worth of Industry A output will require direct purchases of 8 cents from Industry B, 11 cents from Industry C, 17 cents from Industry D, 6 cents from Industry E, 3 cents from Industry F, and intraindustry transactions of 16 cents. Inputs from the processing sector make up 61 cents of each dollar of Industry A's output.

If the input coefficients remain constant from year to year or can be adjusted on the basis of new information, one can calculate the amount of direct purchases required from each industry as a result of an increase (or decrease) in the output of one or more industries in the economy.

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

Table N-2 contains information about direct purchases. That is not the total addition to output resulting from additional sales of one industry's output, however. If final demand for Industry A's output is increased, Industry A must directly purchase more of the output of the other industries (which are inputs to A's production of output). But for those other industries to sell more of their output to A, they must increase their production, so they must buy more of the other industries' outputs that are inputs to their own production, and so on. One could use the input coefficients matrix to iteratively calculate those indirect effects. If demand for the output of Industry A increases by \$1, A will need to boost output by \$1.16 because of the 16 cents in intraindustry transactions needed to produce \$1 worth of output. Sales from B to A increase by 9 cents ($\$1.16 \times .08$), sales from C to A increase by 13 cents ($\$1.16 \times .11$), etc. Going through each industry like that and summing the additions to output would eventually result in the amount of the total effect.

Fortunately, an easier way exists. The method involves taking the difference between an identity matrix and the input coefficient matrix and from that computing a transposed inverse matrix--a tractable problem on a computer. The result is the total requirements matrix, Table N-3, which shows the total dollar production directly and indirectly required from the industries across the top for each dollar of delivery to final demand by the industries at the left. Each time Industry A sells \$1 of output to a final demand sector, its own output increases by that \$1 plus an additional 38 cents, B's output increases by 25 cents, C's output increases by 28 cents, and so on across the row. (These effects are unrealistically large in response to a \$1 increase in final demand. In a real input-output model, the entries in the total requirements matrix will have smaller values and greater variation. The example worked out this way because small numbers and few zeroes were used in the original transactions table.)

An actual total requirements matrix might show, for example, that the output of the agricultural industry depends on the demand for processed foods, tobacco, textiles, leather products, and chemicals. Thus, there will be fairly large entries in the cells where the agriculture column (remember, the total requirements matrix was transposed from the transactions matrix) intersects the rows of those industries (meaning output of agricultural products will go up by a relatively large amount when demand for the output of those industries increases). Most apparel products, on the other hand, are sold directly to final consumers, so the entries in the apparel column will be relatively small (meaning that output of the apparel industry will not go up by much in response to increased demand for other products since apparel is not an input to many other industries). In regional applications of input-output modelling, the effects shown in the total requirements matrix will be smaller if a lot of the inputs used by industries are imported.

The information in the total requirements matrix, when supplemented with information on households, is the basis from which multipliers are calculated. Multipliers summarize the total effect of an increase in demand for the output of a particular industry per dollar of direct effect.

IMPLAN, the input-output model used for the analyses of the Alaska Wildlife User Surveys, is composed of 528 industries and sectors at the 4-digit SIC level. The data comprising the transactions table and associated final demands are based on the U.S. Department of Commerce, Bureau of Economic Analysis national input-output tables. The national composition matrices of inputs used in industry production (i.e., the mix of inputs industries use to produce their output) and of commodity outputs (the mix of commodities that industries produce) are adjusted using state level data. That means that while the basic structure and technology used by industries is assumed to be a national average, the output levels and levels of regionally purchased inputs are calibrated at the state level.

The base year of the IMPLAN model is 1990, meaning that we assume the structure of the Alaskan economy was unchanged between 1990 and 1991, the year for which the surveys collected data. Given that changes in economic structure occur relatively slow and that IMPLAN uses "national average" technology relationships, that is not a bad assumption. IMPLAN is a linear model meaning that changes in the level of economic transactions have the same effect regardless of whether they are increases or decreases relative to the status quo. That feature of the model allows us to construct "scenarios" composed of the expenditures related to wildlife activities and estimate the total amount of economic activity those expenditures support.

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

IMPLAN is nothing more than a structural model of an economy--in our case, the Alaskan economy and the five substate regional economies. There is no industry or sector in that model called wildlife viewing or hunting or recreation. Hence, the model itself says nothing about how such pursuits contribute to or affect the economy. The way to estimate those effects or contributions, in IMPLAN, is to set up "Scenarios" which are composed of "Activities" which, in turn, are composed of "Events."

The distinctions between Scenarios, Activities, and Events are somewhat artificial and they can be used however best suits a particular analysis. As an example, though, consider a scenario called "Recreation." Activities included in the recreation scenario might include "Camping," "Fishing," "Bowling," and "Symphony Concerts." Each of those activities is composed of a set of expenditures, or events, that together constitute the activity. The aggregation of the activities, in turn, constitute the scenario called recreation. Events in the camping activity might include renting a tent, buying groceries, travelling to a national park, stopping to buy gas along the way, buying a camping permit, and fixing the flat tire you got on the dirt road in the park. Expenditures for each of those items are broken down to industries or sectors from which they come. Tent rental would be attributed to IMPLAN Industry 488 (Amusement and Recreation Services not elsewhere classified), fixing the flat tire would be attributed to Industry 479 (Automobile Repair and Services). Some expenditures, groceries is one such item, are divided between and attributed to several industries--dairy products (Industry 1), fruits (Industry 16), vegetables (Industry 18), etc. Each of those industries include a set of "margins" that specify how much of the expenditures on those items go to retailers, wholesalers, transportation, etc. so those aspects of bringing a product to market are included in the model.

Attributing expenditures among industries is one area where empirical input-output analysis is an inexact science and different assumptions could result in differences in final estimates of economic activity. There are some data sources that can help in making those allocations, but there is room for individual interpretation. This is a further reminder that economic impact estimates are just that--estimates. We spent considerable effort and think we did a good job allocating expenditures to industries, but our estimates, as are all other estimates of economic activity, are subject to those allocations.

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

Potential Demand by Nonresident Hunters for Wildlife Viewing

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics****Exploring Nonresident Hunters' Potential Demand for New Wildlife Viewing Sites**

A somewhat unique part of the Alaska Wildlife User Surveys were the scenarios describing, in very basic terms, several hypothetical wildlife viewing sites aimed at different species. (The actual descriptions can be seen in the survey instrument presented at the end of this report.) Respondents were asked how likely they thought they would be to include sites where they could see specified species of wildlife if it cost a specified amount if they were to plan another trip to Alaska. One must be careful in interpreting the information derived from these scenarios because: (1) the scenarios are only loosely specified in terms of site characteristics and access, and there is room for individual interpretation between respondents as to the actual viewing experience, (2) they imply a guaranteed level of wildlife viewing--a herd of caribou, several Dall sheep, a large concentration of eagles--that is, again, open to differences in interpretation between respondents, (3) they are hypothetical sites, which may or may not be believable to respondents. With these caveats in mind, though, the scenarios can provide useful information on potential demand for new or enhanced/expanded wildlife viewing sites, and on the relative values that nonresident hunters place on different species for viewing.

Based on prior information, we excluded Native Americans from these tables. The literature on contingent valuation surveys, which these scenarios fall into, applied to other cultural groups--i.e. non-Western industrialized societies--is very much in its infancy. A few studies have been done (Shyamsundar and Kramer 1993, Whittington et al. 1990) but the issues are far from resolved. It is our feeling that people from other cultural groups are likely to have trouble answering the kinds of contingent valuation questions typically posed. The questions and contingent valuation mechanisms used to date are not robust to changes in the underlying cultural mindset of the group to which they are posed. Hence, Native Americans were excluded from the tables in this section. Based on our survey, about 96% of nonresident hunters (6,729 hunters) are in this non-Native American subsample.

Tables A-25 present the distribution of responses for each of the scenarios. The dollar amounts used in the scenarios (which we will refer to as bids) were randomly assigned from a selected distribution of values, and different in each questionnaire and scenario. For ease of presentation, they are collapsed into \$50 increments in Tables A-25. The range of values differed between scenarios, as is evident from looking at how high the range of values extends for each scenario. The column percentages in the TOTAL column for each scenario show the proportion of bids falling into each of the \$50 increments across the sample. The distributions were set up to have more bids in the lower regions of the range and fewer at the higher regions. The general trend for each of the scenarios is an increasing proportion of "unlikely" or "not very likely" responses as the dollar bid amount increases, while the proportion of "very likely" or "somewhat likely" generally decreases. That is as expected from basic economic theory.

One way to interpret and use Tables A-25 is to look at a particular scenario and consider the potential demand at any given cost level to access the site. For example, if a site were opened at which a herd of caribou could be viewed and it cost \$51 to visit the site, we would expect about 32.3% of nonresident non-Native American hunters (2,173 hunters given that we estimate a total of 6,729 non-Native American nonresident hunters) to visit the site on a return trip to Alaska--9.4% thought they were very likely to visit the site and 22.9% thought they were somewhat likely to visit. If it cost \$101 to visit the site, we would expect about 28.2% of nonresident non-Native American hunters (1,898) to visit the site on a return trip to Alaska. If it cost \$501 to visit the site, about 7.5% of nonresident non-Native American hunters (505 hunters) would be expected to visit the site on a return trip. Using the tables in this way, one would need to consider the trend of responses as the dollar amount increased. The 4.8%, in the \$301 - \$350 bid range, who thought they were very likely or somewhat likely to visit the site on a return trip might be an aberration considering that 17.3% and 13.9% responded with one of the "likely" responses in the \$251 - \$300 and the \$351 - \$400 ranges, respectively. Likewise, the 17.2% responding very likely or somewhat likely in the \$451 - \$500 range might be somewhat of an aberration. The point is that one must not focus on one specific range and lose sight of the full picture.

The responses in Tables A-25 are based on all the responses to all the bids in the designated range. That is, the "very likely" responses were tallied from all bids ranging from \$51 to \$100 (and all integer values within the range were equally likely to be selected) to arrive at the row percent of 9.4 for the

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

caribou site. Likewise, the "somewhat likely" bids were tallied to arrive at the row percent of 22.9 for bids ranging from \$51 to \$100, and the same for the 46.3% reported for the "unlikely" response. Hence, we expect the reported row percents to be conservative estimates at the lower end of the designated range, and somewhat overestimated at the upper end of the range. They are likely to be most accurate in the middle of the range. Based on this line of reasoning, the expected visitation described in the previous paragraph could be thought of as a conservative estimate because we picked values at the bottom of the range in each case. Another approach might be to consider the row percents for each range of bids to be applicable to the midpoint of the range and base visitation estimates on those cost amounts and percentages.

A caveat to the uses illustrated above is to consider the sample size at each bid range. The \$51 to \$100 range of bids contained 9.0% of the responses for the caribou site, so the row percents are based on a subsample of 55 hunters (9.0% of 615 respondents in the total nonresident hunter sample who were not Native American). Responses in the \$501 to \$550 range of bids, on the other hand, are based on a subsample of about 14 people (2.2% of 615). In the range of sample sizes we are dealing with, larger subsamples imply greater reliability of results.

Distributions of values, based on the responses to the scenarios, were estimated for each of the wildlife viewing sites. The "very likely" and "somewhat likely" responses were collapsed into a single "yes" category. The "unlikely" and "not very likely" responses were collapsed into a single "no" category. The "yes" and "no" responses were then used as the dependent variable in a logistic regression with bid dollar amount and a constant term as the independent variables. The estimated distributions are the probabilities of a "yes" response to the question of whether the respondent would visit the specified site on a return trip to Alaska as a function of bid amount and a constant term. They represent cumulative distribution functions for the gross values of the different sites represented in the scenarios.

Means were calculated from those estimated distributions and are displayed in Table A-26 for each scenario. Calculation of the mean was carried out to the dollar amount at which the probability of a "yes" response was 1%, at which point the distribution was truncated. The interpretation of those mean values is that they represent the average gross value placed on one trip to a site at which the respondent could view the specified wildlife species if he/she were to visit Alaska again. The values are gross because they represent, on average, the maximum amount an individual would be willing to pay to visit the site—they contain both the trip expenses and consumer surplus amount that were discussed in the Net Economic Value of Primary Big Game Hunting Trips section.

The top row of Table A-26 shows the estimated mean value for each type of viewing site based on the complete subsample of non-Native American nonresident hunters. They range from \$38 for a trip to a site where a large concentration of sea birds could be seen to \$364 for a trip to a site at which a large concentration of grizzly bears could be seen. Based on the estimated distributions, the sites for viewing grizzly bears, wolves, and Dall sheep would provide the highest level of benefits, while those for sea birds and eagles would provide the least benefit to nonresident non-Native American hunters. The remaining rows in Table A-26 are mean values estimated for several sample breakdowns. In each case, mean values were estimated for each condition separately (gender = male, gender = female, etc.) and for all nonmissing responses for the combined conditions (gender = male or female, etc.). Again, Native Americans are excluded from all the results.

Table A-27 shows the results of likelihood ratio tests performed using the estimated distribution functions for the different subsample restrictions. Such a procedure tests for differences between subsets of the sample by testing the hypothesis that the distributions estimated for each restricted subsample are indistinguishable from that estimated for the unrestricted sample. For example, a likelihood ratio test performed on "income of respondent" will estimate separate distribution functions for each income level as well as a distribution function for all income levels combined. Because maximum likelihood methods were used for the estimation, if the null hypothesis of no difference between people with different income levels is true, the log likelihoods of the separate regressions will sum to the log likelihood of the combined regression. The test can be used to indicate whether people at each income level place the same value on the specified wildlife viewing site. If the null hypothesis that the distribution functions estimated separately for each income level are statistically

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

indistinguishable from that estimated for all income levels together cannot be rejected, we conclude that people at each income level place the same value on the site--i.e., we assert that the means of statistically indistinguishable distribution functions are also statistically indistinguishable.

The first test shown in Table A-27 is based on income of respondent. For the caribou site, -2 log likelihood for the distribution functions estimated for each income level separately are 137.031, 99.04, 67.951, 52.504, and 160.761 for the categories below \$40,000, \$40,001 to \$60,000, \$60,001 to \$80,000, \$80,001 to \$100,000, and over \$100,000, respectively. The sum of those log likelihoods is 517.287. For the distribution function estimated using the combined data for all 5 income levels, -2 log likelihood is 532.736. The difference between that and the sum of those from the separate distribution functions, 15.449, is used as a test statistic. The test statistic follows a chi-square distribution with degrees of freedom equal to the difference between the number of parameters estimated for all the separate distributions and the number of parameters estimated in the combined distribution, in this example 8 (10, coming from 5 distributions with 2 parameters each, minus 2). The critical chi-square value at the 5% level with 8 degrees of freedom is 15.507, which is greater than the test statistic of 15.449 so we cannot reject the null hypothesis that the distributions estimated for each income level separately are the same as that estimated for all the income levels together. The test statistic for the moose site, 21.028, is greater than the critical chi-square value so we reject the null hypothesis that the income level distribution functions are the same for the moose viewing site. The null hypothesis is also rejected for income levels with the wolf, sea bird, and eagles sites. The differences in mean value between people with different income levels are significant for those species.

Significant differences are found for the wolf, whale, grizzly bear, and sea bird viewing sites based on gender of respondent (critical chi-square value for 5% with 2 degrees of freedom is 5.991). One problem with the tests based on gender, though, is that the number of female nonresident hunters is very small so it was not possible to estimate models for females for all of the sites, and those that could be estimated were not very powerful. Age of respondent is a significant differentiating factor for value placed on the viewing sites for wolves and grizzly bears. Education of respondent is not a significant differentiating factor for any of the wildlife viewing sites. The distribution functions based on years the respondent has hunted in Alaska are significantly different (critical chi-square for 5% with 6 degrees of freedom is 12.592) only for the moose site.

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

Part B

**Original Questionnaire
Completed by
647 Nonresident Hunters**

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

HUNTING IN ALASKA**What does it mean to you?**

It is very important that this questionnaire be completed by the person to whom it is addressed. Please try to answer what you believe to be true for you; don't ask others for their opinions. The best answers are the ones which most closely reflect your own feelings, beliefs, experiences, and knowledge. If you have any problems filling out the questionnaire please call toll-free 1-800-770-9172 (inside Alaska) or 1-800-777-9172 (outside Alaska) from 8:00 AM to 5:00 PM Alaska time, Monday through Friday, and we will be happy to help you. Thank You !

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

1. How old were you when you first went hunting? *(FILL IN THE BLANK)*

_____ Years Old

2. Did you ever hunt in Alaska before 1991? *(CIRCLE YOUR ANSWER AND FILL IN THE BLANK)*

NO

YES How many different years? _____

3. Where do you usually hunt for big game? Please tell us the state, province, or country. *(FILL IN THE BLANKS)*

4. In terms of big game hunting, what places do you think are Alaska's competitors? If you could not hunt in Alaska, where would you consider going to hunt big game? *(FILL IN THE BLANKS)*

5. In general, how does big game hunting in Alaska compare to big game hunting in the best places you have hunted big game? *(CIRCLE ONE NUMBER)*

1 **I have never hunted big game outside Alaska.**

2 **Alaska is one of the best places I have hunted big game.**

3 **Alaska is not as good as the best places I have hunted big game.**

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

The next series of questions are about your 1991 big game hunting trips to Alaska. Before we start, we need to tell you what we mean by some terms.

- * By trip, we mean the time from when you entered Alaska until the time you left, including all the time you were in Alaska. You might have hunted in several locations while you were in Alaska, or engaged in business or other activities, but that would still count as one trip to Alaska.
- * By wildlife, we mean all wild animals except fish.
- * By wildlife viewing, we mean all activities involving wildlife, except hunting or trapping. Activities such as watching, photographing, tracking, painting, or listening to wildlife are included in the term wildlife viewing.

1. How many big game hunting trips did you take in Alaska during 1991?

_____ big game hunting trips in Alaska during 1991.

IMPORTANT INSTRUCTIONS PLEASE READ CAREFULLY

We are going to ask you a lot of questions about one of your big game hunting trips to Alaska so we can estimate the economic importance of big game hunting in Alaska, and find out what kinds of hunting trips nonresident hunters take in Alaska.

- * If you took more than one big game hunting trip in Alaska during 1991, pick out your longest hunting trip. By longest hunting trip we mean the trip on which you spent the most nights in Alaska, even if some of that time was spent doing things besides hunting. We will refer to that trip as your **LONGEST ALASKA HUNTING TRIP**.
- * If you took only one big game hunting trip in Alaska during 1991, that one trip will be your **LONGEST ALASKA HUNTING TRIP**.

Please answer the following questions based on your **LONGEST ALASKA HUNTING TRIP**.

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

2. What month(s) were you in Alaska on your LONGEST ALASKA HUNTING TRIP in 1991? (CIRCLE ALL THAT APPLY)

1	January	5	May	9	September
2	February	6	June	10	October
3	August	7	July	11	November
4	April	8	August	12	December

3. How many nights were you away from home in total on your LONGEST ALASKA HUNTING TRIP, even if some were outside Alaska? (FILL IN THE BLANK)

_____ nights

4. How many nights were you in Alaska on your LONGEST ALASKA HUNTING TRIP? (FILL IN THE BLANK)

_____ nights

5. Please tell us where you hunted and what animals you hunted on your LONGEST ALASKA HUNTING TRIP. If you hunted in more than one place, please tell us about each place.

- * Tell us the Game Management Unit(s) where you hunted (use the enclosed map if you need it). If you do not know the Game Management Unit, please tell us a landmark like a town, lake, river, or road segment you were near or a lodge you stayed at--anything to help us figure out where you were.
- * Tell us what animals you hunted at each place, even if some were not big game animals.
- * For some species, Alaska law requires nonresident U. S. citizens to hunt with a guide-outfitter or certain Alaska relatives. Non U. S. citizens must hunt with a guide-outfitter for all big game species.

In the last column, please tell us if you hunted with a guide-outfitter or with a relative within second degree of kindred, who is an Alaska resident. By second degree of kindred we mean father, mother, brother, sister, child, spouse, grandparent, grandchild, brother- or sister-in-law, son- or daughter-in-law, father- or mother-in-law. Please circle **G** (for guide-outfitter), **R** (for relative within second degree of kindred), or **N** (for neither) whenever they apply.

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

_____	_____	G R N
_____	_____	G R N
_____	_____	G R N
_____	_____	G R N
_____	_____	G R N

6. Was your LONGEST ALASKA HUNTING TRIP the first time you ever hunted any of the species you just listed? (CIRCLE YOUR ANSWER AND LIST THE SPECIES)

NO

YES

Which ones? _____

7. Did you or any of your partners bag an animal or animals on your LONGEST ALASKA HUNTING TRIP? (CIRCLE YOUR ANSWER AND LIST THE SPECIES)

NO

Skip to Question 12

YES

I bagged _____

My partner(s) bagged _____

8. Was your LONGEST ALASKA HUNTING TRIP the first time you or any of your partners ever bagged any of the species you bagged? (CIRCLE YOUR ANSWER AND LIST THE SPECIES)

NO

YES

For the first time I bagged a _____

For the first time my partner(s) bagged _____

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

9. Except for bears, what did you do with the meat from the animal(s) you or your partners bagged? (*CIRCLE ALL THAT APPLY AND ESTIMATE THE POUNDS OF MEAT*)

- 1 We took about _____ pounds of meat home.
- 2 We gave about _____ pounds of meat to people in a local Alaska town or village.
- 3 We gave about _____ pounds of meat to someone else in Alaska.
- 4 Our guide-outfitter disposed of about _____ pounds of meat for us.
- 5 Something else (Please specify and estimate the pounds) _____

10. Did you or any of your partners bag an animal or animals on your LONGEST ALASKA HUNTING TRIP that you consider to be trophy quality? (*CIRCLE YOUR ANSWER AND LIST THE SPECIES*)

NO Skip to Question 12

YES I bagged a trophy _____
My partner(s) bagged a trophy _____

11. Did you or your partners take any of the following parts from the animals you bagged home with you? (*CIRCLE ALL THAT APPLY*)

- 1 None
- 2 Antlers or horns
- 3 Cape
- 4 Skull
- 5 Hide
- 6 Other (Please specify) _____

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

12. How important to the success of your trip do you consider bagging whatever game you are hunting? (*CIRCLE ONE NUMBER*)

- 1 Bagging an animal is the most important factor in whether I consider my trip a success.
- 2 Bagging an animal is important but not the only ingredient in a successful trip.
- 3 Bagging an animal is really not that important. I can have a successful trip without bagging an animal.
- 4 Bagging an animal is really not even a factor in whether I consider my trip a success.

13. If you did not use a guide-outfitter on your LONGEST ALASKA HUNTING TRIP, please skip to Question 14. If you did use a guide-outfitter, please continue on with this question.

Were you required by regulations to use a guide-outfitter for the species you were hunting? (*CIRCLE YOUR ANSWER*)

NO

YES, If you had not been required to use a guide-outfitter, would you still have used one? (*CIRCLE YOUR ANSWER*)

NO

YES

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

Below are some statements that hunters might make about their experience with a guide-outfitter. Please tell us how much you agree or disagree with each statement. (CIRCLE ONE NUMBER FOR EACH STATEMENT)

	Strongly Agree	Moderately Agree	Moderately Disagree	Strongly Disagree	Don't Know/ No Opinion
My guide-outfitter generally provided all the facilities and services I contracted with him for.	1	2	3	4	5
The facilities provided by my guide-outfitter were generally of acceptable quality.	1	2	3	4	5
The services provided by my guide-outfitter were generally of acceptable quality.	1	2	3	4	5
I felt safe while travelling to and from the hunting area with my guide-outfitter.	1	2	3	4	5
I felt safer being with a guide-outfitter in the field than I would have felt without him.	1	2	3	4	5
I was satisfied with my guide-outfitter's knowledge of where to find the kinds (species, size, etc.) of big game I wanted to hunt.	1	2	3	4	5
I was satisfied with my guide-outfitter's ability to get me within good shooting range of the animals I was hunting.	1	2	3	4	5
My guide-outfitter delivered what I expected from talking to him and reading his advertising brochures and literature.	1	2	3	4	5
Overall, the service I received from my guide-outfitter was worth the money I paid.	1	2	3	4	5
I would use the same guide-outfitter again or recommend him to friends.	1	2	3	4	5

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

Would you have wanted to take that same hunt without a guide-outfitter? (*CIRCLE YOUR ANSWER AND FILL IN THE BLANK*)

YES

NO Why not? _____

14. Did the Alaska law requiring nonresidents to hunt with a guide-outfitter, or a close relative who is an Alaska resident, for some species prevent you from hunting any big game species in Alaska? (*CIRCLE YOUR ANSWER AND FILL IN THE BLANK*)

NO

YES Which one(s)? _____

15. Did you do other things on your LONGEST ALASKA HUNTING TRIP besides hunt? (*CIRCLE ALL THAT APPLY*)

- | | | | |
|---|---------------------------------|---|------------------------|
| 1 | Fished | 5 | Business activities |
| 2 | Camped | 6 | Other activities |
| 3 | Viewed or photographed wildlife | 7 | Nothing, I just hunted |
| 4 | Visited friends or relatives | | |

16. Was big game hunting the primary reason for your LONGEST ALASKA HUNTING TRIP? By primary reason we mean you would not have taken your trip to Alaska had big game hunting not been available. (*CIRCLE YOUR ANSWER AND FILL IN THE BLANK*)

YES _____ Big game hunting was the primary reason for my LONGEST ALASKA HUNTING TRIP.

NO _____ Big game hunting was not the primary reason for my LONGEST ALASKA HUNTING TRIP. The main reason I came to Alaska on my LONGEST ALASKA HUNTING TRIP was to _____

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

17. How many hunters, including yourself, were in your hunting party?

_____ hunters including myself were in the party

18. How did you get to your hunting area from where you entered Alaska on your LONGEST ALASKA HUNTING TRIP? (CIRCLE ALL THAT APPLY AND FILL IN THE TIME WHERE APPROPRIATE)

- 1 Car or truck; please estimate the total time you drove: _____
- 2 Private boat; please estimate the total time you boated: _____
- 3 Private airplane; please estimate the total time you flew: _____
- 4 Commercial airline
- 5 Chartered airplane/Air taxi
- 6 Train or Bus
- 7 Ferry
- 8 Chartered boat
- 9 Other (please specify) _____

19. On how many different days during your LONGEST ALASKA HUNTING TRIP did you spend all or part of the day actually hunting?

_____ days actually hunting

On those days, how many hours per day on average did you actually hunt? Please give us your best estimate.

_____ hours per day actually hunting

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

20. To what extent did wildlife viewing contribute to the enjoyment of your LONGEST ALASKA HUNTING TRIP? As before, wildlife viewing means activities like watching, photographing, studying, painting, or tracking wildlife--any wildlife-related activity other than hunting or trapping. (CIRCLE ONE NUMBER)
- 1 Wildlife viewing did not contribute to the enjoyment of my trip at all.
 - 2 Wildlife viewing contributed some enjoyment to my trip, but not a lot.
 - 3 Wildlife viewing contributed a lot of enjoyment to my trip, but not as much as hunting.
 - 4 Wildlife viewing contributed as much to the enjoyment of my trip as hunting.
 - 5 Wildlife viewing contributed more to the enjoyment of my trip than hunting.
21. Did you use frequent flyer benefits for any part of the transportation on your LONGEST ALASKA HUNTING TRIP? (CIRCLE YOUR ANSWER AND FILL IN THE BLANKS)
- NO
- YES Please give us your best estimate of how much money those frequent flyer benefits saved you.
- \$ _____
- Would you still have taken your LONGEST ALASKA HUNTING TRIP had you not been able to use frequent flyer benefits? (CIRCLE ONE NUMBER)
- 1 Definitely No
 - 2 Probably No
 - 3 Probably Yes
 - 4 Definitely Yes

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

IMPORTANT INSTRUCTIONS PLEASE READ CAREFULLY

To allow us to estimate the economic importance of big game hunting, please answer the following questions and list the expenses for your LONGEST ALASKA HUNTING TRIP as best you can remember.

- * Please tell us what you purchased on your LONGEST ALASKA HUNTING TRIP.
- * Then tell us the nearest Alaska town or community where you purchased the item. If you bought it outside Alaska or from a catalog, just write "OUTSIDE".
- * Tell us the total amount you paid for the item (not just the price for each unit). Report all money that came out of your pocket, even if you paid someone else's expenses. Do not include expenses someone else paid for you.
- * Include expenses that occurred before your LONGEST ALASKA HUNTING TRIP that were made in preparation for your trip (like ammunition) and expenses that occurred after your trip, but were directly related to your LONGEST ALASKA HUNTING TRIP (like meat processing and taxidermy).
- * Give us your best estimate if you don't remember exactly how much you paid for something or where you bought it.
- * Please list the items you bought in Alaska first. If you run out of room in any of the categories, just give us an estimate of the total cost of the items you were not able to list in that category after the last line and label it UNLISTED TOTAL.

1. **Round Trip Transportation Expenses** For each of the following that apply, please fill in the town where purchased (or OUTSIDE, if purchased outside Alaska) and the cost. (Do not include expenses that were part of a guided hunt or tour package. We will ask you about those expenses in Questions 4 and 15.)

	Where Purchased Alaska Town(s) or OUTSIDE	Cost to You (Best Estimate)
Commercial airline	_____	\$ _____
	_____	\$ _____
Airplane charter/Air taxi	_____	\$ _____
	_____	\$ _____
Rental of Car, Truck, Motorhome, etc.	_____	\$ _____

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

19. Please tell us about any other equipment, special clothing, or supplies you purchased in Alaska during 1991 other than those already listed for your **LONGEST ALASKA HUNTING TRIP**. What did you buy, where did you buy it (the nearest Alaska town or community), and how much did it cost? Include things like guns, ammunition, scopes, decoys, reloading equipment, special clothing, camping equipment, etc. If you don't remember exactly where you bought something or how much you paid, please give us your best estimate. *(CIRCLE ONE NUMBER AND LIST THE ITEMS)*

- 1 I did not purchase anything in Alaska other than the items I already told you about for my **LONGEST ALASKA HUNTING TRIP**.
- 2 I purchased the following:

Items	Alaska Town(s) Where Purchased	Cost to You (Best Estimate)
_____	_____	\$ _____
_____	_____	\$ _____
_____	_____	\$ _____
_____	_____	\$ _____

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

The next set of questions will ask you how satisfied you were with your LONGEST ALASKA HUNTING TRIP and the money you paid for it.

1. All things considered--the expenses, the wildlife, whether you bagged an animal, the overall quality of the trip--do you feel that your LONGEST ALASKA HUNTING TRIP was worth the money you paid? If you had it to do all over again, would you take that exact same hunting trip for the same cost? (CIRCLE YOUR ANSWER)

NO Please skip to Question 4

YES Please go on to Question 2

2. The expenses for your LONGEST ALASKA HUNTING TRIP could have been higher or lower. For example, transportation and other expenses rise and fall over time. Suppose your costs had been higher. How much could the cost of your LONGEST ALASKA HUNTING TRIP have increased before you would have decided it was just not worth it and you would not have taken your LONGEST ALASKA HUNTING TRIP?

In other words: Up to how much more, in addition to what you actually paid for your LONGEST ALASKA HUNTING TRIP, would you have paid to take your LONGEST ALASKA HUNTING TRIP?

I would have paid as much as \$ _____ more than I actually paid to take my LONGEST ALASKA HUNTING TRIP.

3. If you answered \$0 to the previous question, please tell us what that means. (CIRCLE ONE NUMBER)

1 I would not have paid any more to take my LONGEST ALASKA HUNTING TRIP. That trip was worth exactly what I paid and no more.

2 I answered \$0 because I could not put a number on how much more I would have paid for my LONGEST ALASKA HUNTING TRIP.

3 I answered \$0 for other reasons. Please specify _____

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

4. Suppose an easily accessible wildlife viewing site were available that offered good views of wildlife in natural surroundings from a close, but safe, distance. Please tell us how likely you think you would be to include sites like the following in your visit if you were to plan another trip to Alaska.

Assume the cost in each question is the cost per person that a visit to the site would add to the cost of your trip to Alaska. The cost figures are different in every questionnaire. Please give us your answer even if the amount seems ridiculously high or low so that we can consider a full range of values. (CIRCLE ONE NUMBER FOR EACH STATEMENT)

	Very Likely	Somewhat Likely	Not Very Likely	Unlikely
If you were planning another trip to Alaska, how likely do you think you would be to visit a site where you could expect to see....	1	2	3	4
A <u>herd of caribou</u> if it added \$ A to the cost of your trip?	1	2	3	4
<u>Moose</u> if it added \$ B to the cost of your trip?	1	2	3	4
A <u>pack of wolves</u> either from the ground or from an airplane if it added \$ C to the cost of your trip?	1	2	3	4
<u>Several Dall sheep</u> if it added \$ D to the cost of your trip?	1	2	3	4
<u>Typical marine life, and about half the time you would see whales</u> , if it added \$ E to the cost of your trip?	1	2	3	4
A <u>large concentration of grizzly bears</u> if it added \$ F to the cost of your trip?	1	2	3	4
A <u>large concentration of sea birds</u> if it added \$ G to the cost of your trip?	1	2	3	4
A <u>large concentration of eagles</u> if it added \$ H to the cost of your trip?	1	2	3	4

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

This section will ask you about where you got your information on hunting in Alaska, and how well that information prepared you for your trip.

1. Where did you get your information about hunting in Alaska? (*CIRCLE ALL THAT APPLY*)

- 1 Alaska Department of Fish and Game
- 2 A hunting magazine or newsletter
- 3 Other wildlife magazine or newsletter
- 4 Magazine other than a hunting or wildlife magazine
- 5 Newspaper
- 6 Sportsmen's club or organization
- 7 Sportsmen's show or exhibition
- 8 Friends or hunting partners
- 9 Alaska Department of Tourism
- 10 Travel agent
- 11 Guide-outfitter
- 12 Brochures from lodge, tour operators, etc.
- 13 Other (please specify) _____

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

2. Below are some statements nonresident hunters might make about their **LONGEST ALASKA HUNTING TRIP**. Please tell us how much you agree or disagree with each statement. (CIRCLE ONE NUMBER FOR EACH STATEMENT)

	Strongly Agree	Moderately Agree	Moderately Disagree	Strongly Disagree	Don't Know/ No Opinion
I had trouble finding adequate information about big game hunting in Alaska.	1	2	3	4	5
I was adequately prepared for the weather conditions I encountered in Alaska.	1	2	3	4	5
I was adequately prepared for the terrain I encountered in Alaska.	1	2	3	4	5
I brought the right hunting equipment for the conditions I encountered in Alaska.	1	2	3	4	5
I would have liked more information on field dressing large animals or caring for a large quantity of meat.	1	2	3	4	5
Big game hunting in Alaska was as good as I expected it would be.	1	2	3	4	5
I would consider going back to Alaska to hunt.	1	2	3	4	5
I would consider going back to Alaska to do other things besides hunt.	1	2	3	4	5

Nonresident Hunters: Their Hunting Trip Characteristics and Economics

3. Below are some statements that nonresident hunters might make about their experience with wildlife management agencies and the regulatory system in Alaska. Please tell us how much you agree or disagree with each of the following statements. (CIRCLE ONE NUMBER FOR EACH STATEMENT)

	Strongly Agree	Moderately Agree	Moderately Disagree	Strongly Disagree	Don't Know/ No Opinion
The rules and regulations in the Alaska State Hunting Regulations book were generally clear and understandable.	1	2	3	4	5
I had to go to both state and federal agencies to get all the information I needed on hunting regulations in Alaska.	1	2	3	4	5
I had little trouble finding out where to get all the information I needed on hunting regulations in Alaska.	1	2	3	4	5
If nonresident big game hunting license and tag fees were less, I would hunt in Alaska more often.	1	2	3	4	5
I used my big game tag for a species of lesser tag value.	1	2	3	4	5
It is reasonable to require nonresidents to hunt with a guide-outfitter, or a close Alaska relative, for brown/grizzly bear, Dall sheep, and Mountain Goats.	1	2	3	4	5
Nonresident hunters should be required to hunt with a guide-outfitter, or a close Alaska relative, for <u>all</u> big game species in Alaska (moose, caribou, bear, etc.).	1	2	3	4	5

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

4. Did any of the big game hunting rules and regulations in Alaska detract from the overall enjoyment of your Alaska big game hunting trip?

NO

YES Which ones? _____

This last section will ask you for some personal information so we can learn about what kinds of people come to Alaska to hunt. Your answers will be confidential. This information will only be used to report comparisons among groups.

1. Where do you live now? (*FILL IN THE BLANKS*)

Nearest city or town _____ State _____

2. Are you? (*CIRCLE YOUR ANSWER*)

Male

Female

3. How old are you? _____ years old

4. How many people of your immediate family live with you in your house (do not include yourself), and what are their ages? (*FILL IN THE BLANKS*)

_____ people live with me in my house,
and their ages are _____

**Nonresident Hunters: Their Hunting Trip Characteristics and Economics**

5. How many years of school have you completed? (*CIRCLE ONE NUMBER*)

1 Eighth grade or less

4 Some College

2 Some high school

5 College graduate

3 High school graduate

6 Graduate school

6. Have you ever successfully completed a certified hunter education course in Alaska or another state? (*CIRCLE YOUR ANSWER*)

YES

NO

7. What do you consider yourself to be? (*CIRCLE ONE NUMBER*)

1 Asian

2 Black

3 Hispanic

4 Native American

5 White

6 Other (please specify) _____

8. What do you currently do for a living? If retired or unemployed, what was your primary occupation? (*FILL IN THE BLANK*)

Nonresident Hunters: Their Hunting Trip Characteristics and Economics
