Re: Allocative implications of new Karluk Escapement Goals

Because the new escapement goals are based on the overall carrying capacity of the Karluk system and the management plan was based on an assessment of spawner-recruit ratios that were specific to the early run and the late run, there is an allocation shift from set net to Seine fisheries.

I would offer the following language to the Westside Management Plan:

If the Central Section of the North West district is closed after July 6\(^{th}\) and before July 15\(^{th}\), the inner and outer Karluk sections of the NW District must also be closed. Any fish counted through the Karluk weir between July 6\(^{th}\) and July 15 when the NW Kodiak district is closed, is attributed to the Late Run Karluk escapement goal.
