Proposals 36,37,38 are non issues

A long towline up 1200' is primary use to fish shallow water on an ebb tide. These sets aren't static and require one to be aware of their surrounding and to stay on task for the set to be successful. Slowly towing the net off the flats does not create a gear conflict and getting into deeper water with current will pull the set out of position so it's important pay attention. From my observation those using this method in a complete congested area work with each other for the mutual goal of production.
