November 2015

The Division of Subsistence Technical Paper series was established in 1979 and represents the most complete collection of information about customary and traditional uses of fish and wildlife resources in Alaska. The papers cover all regions of the state. Some papers were written in response to specific fish and game management issues. Others provide detailed, basic information on the subsistence uses of particular communities which pertain to a large number of scientific and policy questions.

Technical Paper series reports are available through the Alaska Resources Library and Information Services (ARLIS), the Alaska State Library and on the Internet: http://www.adfg.alaska.gov/sf/publications/. This publication has undergone editorial and professional review.

# ABSTRACT

Each year thousands of Alaskans participate in subsistence activities including the harvest of wild resources from Alaska’s fisheries. Subsistence fishing is an important element of Alaska's social and cultural heritage, as well as a crucial component of the subsistence sector of the state’s economy. In addition, personal use fisheries provide opportunities for Alaska residents to harvest salmon for home use using efficient methods in areas closed to subsistence fishing. This report summarizes Alaska’s 2013 subsistence and personal use salmon fisheries based upon subsistence and personal use permit data and harvest assessment surveys from across the state. New information is compared to findings from previous years and the results are discussed. Where available, information about other subsistence finfish fisheries is included. Additional information from federal agencies regulating and administering certain subsistence fisheries, beginning in 1997, is included where available.

Key words: Pacific salmon, *Oncorhynchus* spp., sheefish, whitefish, rainbow/steelhead trout, Arctic char/Dolly Varden, northern pike, Chinook salmon, coho salmon, sockeye salmon, pink salmon, chum salmon, Norton Sound, Port Clarence, Kotzebue, Yukon, Kuskokwim, Bristol Bay, Chignik, Alaska Peninsula, Aleutian Islands, Kodiak, Cook Inlet, Prince William Sound, Southeast Alaska, Yakutat, subsistence salmon fisheries, personal use salmon fisheries

# CHAPTER 1: INTRODUCTION

This is the fifteenth report in a series of annual reports on Alaska's subsistence and personal use fisheries. It was prepared by the Alaska Department of Fish and Game (ADF&G) Division of Subsistence.

Alaska state law defines subsistence fishing as the taking of fish, shellfish, or other fisheries resources by Alaska residents for subsistence uses (AS 16.05.940 (31)). Subsistence uses of wild resources are defined as "noncommercial, customary and traditional uses" for a variety of purposes. These include:

> … direct personal or family consumption as food, shelter, fuel, clothing, tools, or transportation, for the making and selling of handicraft articles out of nonedible by-products of fish and wildlife resources taken for personal or family consumption, and for the customary trade, barter, or sharing for personal or family consumption … . (AS 16.05.940 (33))

Under Alaska's subsistence statute, the Alaska Board of Fisheries (BOF) must identify fish stocks that support subsistence fisheries. The BOF applies the Joint Board of Fisheries and Game Subsistence Procedures (5 AAC 99.010) to make these determinations, which are called "customary and traditional (C&T) findings." If there is a harvestable surplus of these stocks with C&T uses, the BOF must adopt regulations that provide reasonable opportunities for subsistence uses. When it is necessary to restrict harvests, the statute directs the BOF to assign a preference to subsistence uses (AS 16.05.258).

The Joint Board of Fisheries and Game (Joint Board) is required to identify "nonsubsistence areas," where "dependence upon subsistence is not a principal characteristic of the economy, culture, and way of life of the area or community" (AS 16.05.258 (c)). The Joint Board has identified 5 nonsubsistence areas: the Ketchikan Nonsubsistence Area, the Juneau Nonsubsistence Area, the Anchorage–Matsu–Kenai Nonsubsistence Area, the Fairbanks Nonsubsistence Area, and the Valdez Nonsubsistence Area (5 AAC 99.015). The BOF may not authorize subsistence fisheries in nonsubsistence areas.

Alaska state law recognizes 3 additional categories of fishing: commercial, sport, and personal use. Commercial fishing is the taking of fish "with the intent of disposing of them for profit, or by sale, barter, trade, or in commercial channels" (AS 16.05.940 (5)).

Sport fishing is defined as the taking "for personal use, and not for sale or barter, any fresh water, marine, or anadromous fish by hook and line held in the hand, or by hook and line with the line attached to a pole or rod which is held in the hand or closely attended, or by other means defined by the Board of Fisheries" (AS 16.05.940 (30)).

Personal use fishing is defined as the taking of fish "by Alaska residents for personal use and not for sale or barter, with gill or dip net, seine, fish wheel, long line, or other means defined by the Board of Fisheries" (AS 16.05.940 (25)). Personal use fisheries differ from subsistence fisheries in that they do not meet the criteria for customary and traditional fisheries as established by the Joint Board (5 AAC 99.010), or because they occur within nonsubsistence areas; in addition, a sport fishing license is required. This type of fishery provides Alaska residents with opportunities to harvest fish for noncommercial purposes, utilizing gear other than rod and reel, within nonsubsistence areas.

Every year, the ADF&G Division of Commercial Fisheries prepares Fishery Management Reports (FMRs, formerly "annual management reports," AMRs) for most fishery management areas in the state. Figure 1-1 shows the location of these management areas. Although the FMRs focus primarily on commercial fisheries, most also routinely summarize basic data for programs that collect harvest information for subsistence fisheries and for those personal use fisheries that the Division of Commercial Fisheries administers. Detailed annual reports about subsistence fisheries harvest assessment programs are prepared in the Northwest Alaska, Yukon River, and Kuskokwim River areas. Additionally, the Division of Sport Fish prepares summaries for the personal use salmon fisheries it administers in the Cook Inlet

and Prince William Sound (Upper Copper River) areas. However, until the Division of Subsistence annual subsistence fisheries report series began in 1999, there was no single source that compiled subsistence and personal use fisheries harvest data from all management areas. That is the purpose of this 2013 annual report.

The Federal Subsistence Board (FSB) adopts subsistence fishing regulations for federal waters in Alaska, in compliance with the Alaska National Interest Lands Conservation Act (ANILCA). Only eligible Alaska rural residents may participate in federal subsistence fisheries. For most subsistence fisheries, a single program administered by ADF&G provides harvest estimates for all participants regardless of the location of effort. However, for some fisheries (such as the Pacific salmon *Oncorhynchus* fisheries of the Upper Copper River District), FSB regulations require a federal subsistence fishing permit. The following chapters on each management area note where separate state and federal harvest monitoring programs operate. Subsistence harvest estimates in this report include data from both state and federal permit programs.

It is important to recognize the limitations associated with the effort to present a comprehensive annual report on Alaska's subsistence and personal use fisheries. These limitations include:

- Annual harvest assessment programs do not take place for all subsistence fisheries. Programs are in place for most salmon fisheries, but few other finfish fisheries or shellfish fisheries have annual harvest monitoring programs.
- Annual harvest data summarized in this report are limited to fisheries classified as subsistence or personal use by regulation, which, especially for salmon, generally means fish taken with gillnets, beach seines, dip nets, or fish wheels. In some parts of Alaska, substantial numbers of fish for home uses are taken with rod and reel (considered sport gear by most state area regulations) or are retained from commercial harvests. With noted exceptions, these harvests are not included in the analysis of subsistence harvest data in this report because they are not collected by annual subsistence fisheries harvest programs. Therefore, the harvest data in this report are a conservative estimate of the number of salmon being taken for subsistence uses in Alaska. Underestimations of subsistence salmon harvests are a particular issue in the Southeast region.
- Between management areas, and sometimes between districts within management areas, there is inconsistency in how subsistence and personal use harvest data are collected, analyzed, and reported.
- In some areas there are no routine mechanisms for evaluating the quality of subsistence harvest data. For example, in some areas it is not known if all subsistence fishers are obtaining permits and providing accurate harvest reports. This can result in a significant underestimation of harvests.
- There are also few programs for contextualizing annual subsistence harvest data so as to interpret changes in harvests. In some cases, however, FMRs do contain discussions of data limitations and harvest trends.

Despite these limitations, it is nonetheless possible to present an informative, conservative statewide overview of subsistence and personal use harvests of salmon. Information for all areas of the state where subsistence and personal use salmon fisheries occur is covered in this report. In past reports, we only included data for personal use salmon fisheries in the Yukon Management Area, the Prince William Sound Management Area (specifically, the Chitina Subdistrict of the Upper Copper River District), and the Southeast region because these fisheries were classified as subsistence fisheries in the past, and are administered in programs that collect subsistence harvest data. We did not include data from the Cook Inlet Management Area personal use salmon fisheries in past statewide overviews, primarily because most of these fisheries have relatively short histories. However, beginning in the report for 2010, we

added harvest data from the Cook Inlet personal use salmon fisheries so as to provide a complete statewide summary for all subsistence and personal use salmon harvests.

The quality and quantity of subsistence harvest data for finfish other than salmon and for shellfish are very uneven. For other finfish, if annual subsistence harvest information is collected, it is reflected in this report if the summary data were available to the Division of Subsistence. Otherwise, we have usually noted which species are primarily used for subsistence, relying in general on baseline studies conducted by the Division of Subsistence. In a small number of instances we have drawn from reports prepared for the BOF. This annual report does not attempt to provide a comprehensive overview of subsistence shellfish harvests.

In 1988, the Division of Subsistence prepared the first version of the Historical Subsistence Salmon Harvest Database (HSSHDB). As part of the cooperative agreement that supported the development of this annual report series, this database was updated, upgraded, and renamed the Alaska Subsistence Fisheries Database (ASFDB).[1] The database is written for Microsoft Access software.[2] It is organized by 21 subsistence fisheries and is generally reflective of unique harvest assessment programs and regulatory structures. It contains harvest data organized by species, year, community of residence of permit holder, and gear type. The number of permits issued and returned each year is included as well. The most complete data sets are sought; data sets which, in some cases, are more up-to-date than those reported in FMRs.

In 2008, the division received funding from the Alaska State Legislature to develop and annually update a web-based version of the ASFDB. This version of the database was developed using Microsoft SQL Server to store the data and Adobe ColdFusion 8 to create the user interface. The final product, projected to be available to the public in 2016, will contain all historical information from the HSSHDB along with contemporary data from the ASFDB stored in Microsoft Access, and will be updated periodically with new subsistence and personal salmon fisheries data.

The historical ASFDB is not currently available online. Upon request, the Division of Subsistence distributes the database on CD-ROM, along with the Community Subsistence Information System[3], formerly the Community Profile Database (Scott et al. 2001). The CSIS includes the results of Division of Subsistence systematic household harvest surveys and is the primary source for subsistence harvest data for shellfish and for finfishes other than salmon.

In most fisheries data analysis, the Division of Subsistence expands harvest estimates from reported harvests in order to account for unreturned permits. In a few cases, this results in a larger estimate than is found in those FMRs that routinely only summarize data from returned permits. Also, the ASFDB calculates harvest estimates first for all permit holders by community represented in the fishery, and then sums these community estimates for a fishery total. This method is in contrast to the expansion method used by other divisions to analyze data from certain fisheries, such as the subsistence fishery in the Glennallen Subdistrict of the Prince William Sound Area. The harvest data analysis for this fishery presented in the FMR only considers the total number of issued and returned permits in expansion, resulting in slightly different estimates of total harvests than those in this report.

It is important to note that the preparation of this annual report and the supporting database were 2 objectives of the Statewide Subsistence Fisheries Harvest Monitoring Strategy project funded by the U.S. Fish and Wildlife Service (USFWS) Office of Subsistence Management (OSM) and implemented jointly by the Division of Subsistence and the Alaska Inter-Tribal Council (AITC). A central goal of the project was to develop recommendations for a unified subsistence harvest assessment program for Alaska's subsistence fisheries. A working group composed of state, federal, and tribal members developed these

1. David A. Caylor and Louis A. Brown. 2006. ASFDB. Alaska Department of Fish and Game Division of Subsistence, Juneau.
2. Product names are given for scientific completeness; they do not constitute product endorsement.
3. ADF&G Division of Subsistence, Community Subsistence Information System (CSIS): http://www.subsistence.adfg.state.ak.us/CSIS/.

recommendations. The recommendations are available as a separate document (ADF&G and AITC 2000) a final report with an overview of all the project activities is also available (Fall and Shanks 2000). The final report also includes comments on existing subsistence harvest assessment programs, based on working group discussions as well as interviews of ADF&G staff conducted by the Division of Subsistence. We have drawn on these comments for most of the evaluations of harvest data in this annual report. As background for the efforts of the working group, Division of Subsistence staff prepared detailed overviews of current subsistence fisheries harvest assessment programs. These are the basis of the program descriptions that appear in this report, with updates as necessary.

A final note regarding data ranges and averages: except where otherwise noted, averages in this report do not include the current data year (2013). Both date and numeric ranges are inclusive. The following list illustrates named-ranges used in this report and their meanings.

- 5-year average: 2008–2012
- 10-year average: 2003–2012
- 15-year average: 1998–2012
- Historical average: yyyy–2012, beginning of range varies depending on available data

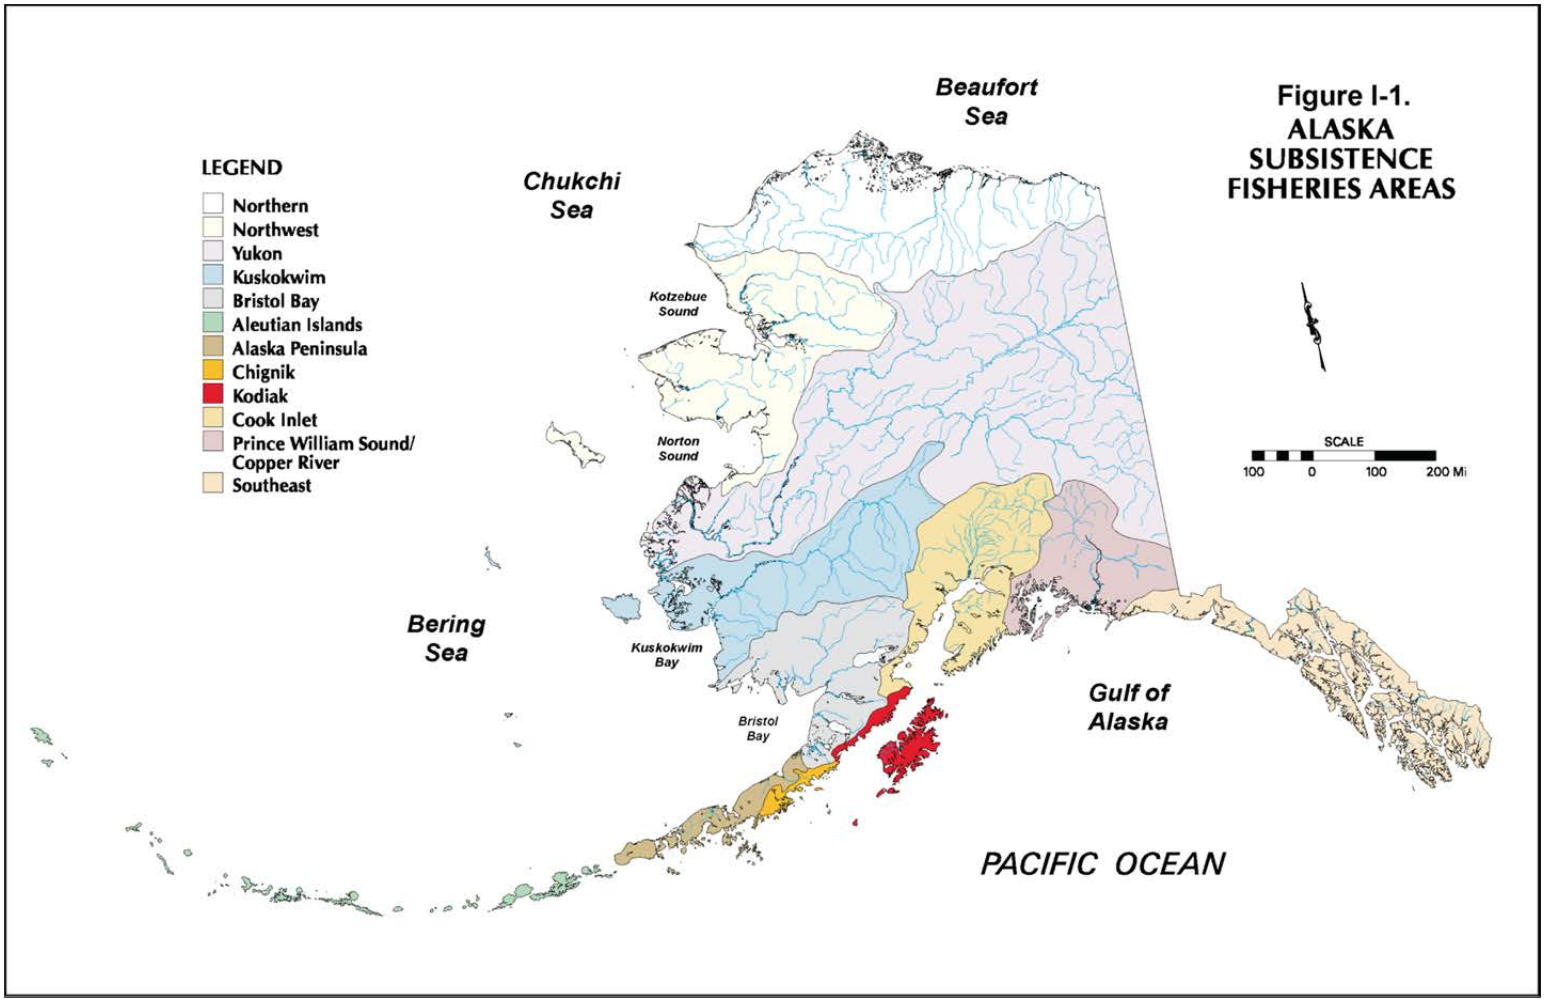

Figure 1-1.–Alaska subsistence fisheries areas.

# CHAPTER 2: OVERVIEW OF SUBSISTENCE FISHERIES IN ALASKA

## SUBSISTENCE HARVESTS IN RURAL ALASKA

Of the estimated 36.9 million pounds of wild foods annually harvested for subsistence purposes in rural Alaska communities, subsistence fisheries contribute about 32% from salmon, 21% from other finfish and 3% from shellfish (Fall 2014:2, 3) (Figure 2-1). On average, the subsistence fisheries harvest provides about 167 lb of food per person annually in rural Alaska (Fall 2014:2). Although they constitute a major portion of the food supply, subsistence harvests represent just a small part of the annual harvest of wild resources in Alaska: about 1.1% (fish, game, and other resources combined). Commercial fisheries take 98.2% of the wild resource harvest, personal use fishing and general hunting by Alaskans take 0.2%, and sport fisheries and hunts take about 0.6% of the fish and game harvest.

## SUBSISTENCE SALMON HARVESTS IN 2013

The estimated total subsistence harvest of salmon in Alaska in 2013, based on annual harvest assessment programs, was 903,741 fish (Table 2-1).[1] The estimated statewide harvest by species was as follows: 347,834 sockeye salmon *O. nerka* (39%), 360,920 chum salmon *O. keta* (40%), 83,729 Chinook salmon *O. tshawytscha* (9%), 81,295 coho salmon *O. kisutch* (9%), and 29,963 pink salmon *O. gorbuscha* (3%) (Figure 2-2).

In 2013, fisheries in 8 management areas accounted for 94% of the total estimated statewide subsistence salmon harvest (Table 2-1; Figure 2-3). These were the Yukon Management Area (257,239 salmon; 28% of the statewide total); the Kuskokwim Management Area (177,643 salmon; 20%); the Bristol Bay Management Area (125,764 salmon; 14%); the Glennallen Subdistrict of the Prince William Sound Management Area (98,523 salmon; 11%); the Norton Sound-Port Clarence Area[2] (62,579 salmon; 7%); Southeast Region[3] (including the Stikine River federal fishery) (48,738 salmon; 5%); the Kotzebue District (50,754 salmon; 6%); and the Kodiak Management Area (31,405; 3%).

The largest estimated subsistence harvests of Chinook salmon in 2013 occurred in the Kuskokwim Management Area (51,211 salmon; 61%), followed by the Bristol Bay Management Area (12,858 salmon; 16%), Yukon Management Area (12,575 salmon; 15%), the Glennallen Subdistrict (2,658 salmon; 3%); the Copper River Flats (916 salmon; 1%); and the Norton Sound-Port Clarence Area (897 salmon; 1%) (Figure 2-4). For sockeye salmon, the largest estimated subsistence harvests in 2013 were in the Bristol Bay Management Area (98,765 salmon; 29%), followed by the Glennallen Subdistrict (95,711 salmon; 28%), the Kuskokwim Management Area (42,996 salmon; 12%), the Southeast Region (38,732 salmon; 12%), and the Kodiak Management Area (27,757 salmon; 8%) (Figure 2-5).

In 2013, as in past recent years, 4 areas dominated the subsistence chum salmon estimated harvest: the Yukon Management Area (229,019 salmon; 63% of the statewide harvest), Kuskokwim Management

1. Annual reports prior to 2010 included personal use salmon harvests from Southeast Alaska and the Chitina Subdistrict of the Upper Copper River in the discussion of subsistence harvests. Beginning with the 2010 report, personal use salmon fisheries are discussed separately. One exception is the small personal use harvest that occurs in those portions of the Yukon Management Area that are within the Fairbanks Nonsubsistence Area. Also, as noted in Chapter 1, Cook Inlet Area personal use salmon harvest data have been added to the annual report.
2. Subsistence harvest estimates for Northwest Alaska (Norton Sound-Port Clarence Area and the Arctic-Kotzebue Area for 2003, 2004, and 2012 do not include the regional center of Kotzebue, which was included in the harvest assessment program for 1994–2002. No subsistence fisheries harvest data were collected in the Kotzebue District for 2005 through 2011. Therefore, the estimated harvest totals for Northwest Alaska as reported for 2003–2011 are incomplete. See also Chapter 3.
3. As discussed further in Chapter 13, state subsistence regulations for the Southeast Region focus on sockeye salmon. Small harvests of Chinook and coho salmon are reported on permit returns as incidental to sockeye salmon harvests. The major portion of coho and Chinook salmon harvests for home uses in Southeast is taken with rod and reel (classified by regulation as sport gear). Thus the Southeast Region is particularly underrepresented in statewide overviews based on permit data.

Area (54,821 salmon; 15%), Kotzebue District (45,715 salmon; 13%), and the Norton Sound-Port Clarence Area (22,079 salmon; 6%) (the latter two areas were combined as "Northwest Alaska" in annual reports prior to 2012) (Figure 2-6). Of the statewide estimated subsistence harvest of coho salmon in 2013, the greatest share was taken in the Kuskokwim Management Area (27,874 salmon; 34%), followed by the Yukon Management Area (14,566 salmon; 18%), Norton Sound-Port Clarence Area (13,994 salmon; 17%), Bristol Bay Management Area (8,635 salmon; 11%), the Southeast Region (2,912 salmon; 4%), the Port Graham and Koyuktolik subdistricts (2,685 salmon; 3%), and the Kodiak Management Area (2,528 salmon; 3%) (Figure 2-7). Finally, the largest portion by far of the statewide estimated pink salmon subsistence harvest in 2013 occurred in the Norton Sound-Port Clarence Area (19,795 salmon; 66%), followed by the Southeast Region (3,029 salmon; 10%), and the Alaska Peninsula Area (1,133 salmon; 4%) (Figure 2-8).

Table 2-2 reports historical estimated subsistence salmon harvests for 1994 through 2013 based on annual harvest assessment programs. While earlier estimates for many of the fisheries are available, 1994 marks the first year that data from all of the included fisheries were available and collected with methods comparable to those currently in use.

The 20-year period reflected in Table 2-2 shows a general downward trend. Estimates from 2000 through 2008 suggested this trend might have been stabilizing. However, the 2013 estimate of 903,741 salmon was the ninth-lowest within the 20-year period, with the 775,642 salmon harvested in 2009 being the lowest estimate, and the 834,627 salmon harvested in 2010 the third-lowest, since 1994. The estimate for 2012 of 935,470 was the highest since 2008. The 2013 estimate of 903,741, although down from 2012, was higher than the recent 5-year average (858,876 salmon) and the recent 10-year average (886,516 salmon), but lower than the historical average since 1994 (942,375 salmon). The collection of harvest data in the Kotzebue District for the first time since 2003 may account for the slight rise in the statewide subsistence harvest estimates for 2012 and 2013 compared to recent years. It should also be noted that the estimate of 83,729 Chinook salmon harvested in subsistence fisheries in 2013 is the second-lowest on record (2012 was the lowest), and is just 55% of the annual average since 1994 and 35% below the next-lowest annual estimate (128,657 Chinook salmon in 2011).

## PERSONAL USE SALMON HARVESTS IN 2013

In 2013, personal use fisheries produced an estimated harvest of 665,303 salmon (Table 2-1). The Kenai River dip net fishery accounted for 53% of the statewide personal use salmon harvest (354,728 fish), followed by the Chitina Subdistrict dip net fishery (28%; 187,614 salmon), the Kasilof River dip net fishery (13%; 88,234 salmon), the Kasilof River setnet fishery (2%; 14,622 salmon), the Southeast Region (Juneau and Ketchikan non-subsistence areas only) (2%; 10.605 salmon), and the Kachemak Bay setnet fishery (<1%; 2,001 salmon). Sockeye salmon composed 98% of the Alaska personal use salmon harvest in 2013 (Figure 2-9).

The personal use harvest of 665,303 salmon in 2013 was the fourth-largest total since comprehensive records became available in 1994, but down from the record harvests of 2011 and 2012 (Table 2-3). The average annual personal use harvest since 1994 of 435,199 salmon is 65% of the 2013 total. Increased harvests in the Upper Cook Inlet personal use dip net fisheries account for most of the growth of personal use harvests since 1994 (see Chapter 11).

## STATEWIDE SUBSISTENCE AND PERSONAL USE SALMON HARVESTS, 1994–2013

Table 2-4 reports historical estimated subsistence and personal use salmon harvests for 1994 through 2013 based on annual harvest assessment programs. As noted above, 1994 marks the first year that comparable data from all of the included fisheries are available.

The 20-year period reflected in Table 2-4 shows generally stable statewide harvest totals: the recent (2008–2012) 5-year average harvest was 1,525,128 salmon compared to a 19-year annual average of

1,377,575 salmon. The total harvest estimate for 2013 of 1,569,044 salmon is the third-highest within the 20-year period. As noted above, however, harvests in subsistence fisheries have generally declined since 1994 while personal use harvests have increased. In 2013, sockeye salmon made up 64% of the combined subsistence and personal use salmon harvests, followed by chum (23%), coho (6%), Chinook (5%), and pink salmon (2%) (Figure 2-10).

Table 2-5 reports subsistence and personal use harvests in 2013 by species and participants' place of residence, with harvests from all subsistence and personal use fisheries combined.

Table 2-1.–Alaska subsistence and personal use salmon harvests, 2013.

*Source* ADF&G Division of Subsistence, ASFDB 2014 (ADF&G 2015).

*Note* Included in this table are all harvest estimates based upon annual harvest monitoring programs.

a. Because the numbers of permits issued for the Kodiak and Port Graham/Koyuktolik fisheries are unknown, the numbers of permits returned are used in place of these values.

b. Formerly included within Northwest Alaska. Partial coverage for Arctic and Kotzebue Districts; see Chapter 3 for details.

c. Includes a small personal use harvest that occurs within the Fairbanks Nonsubsistence Area.

d. Reclassified as a personal use fishery in 2003.

e. A single permit is issued for the Kasilof set net, Kasilof dip net, Kenai dip net, and Fish Creek dip net fisheries. In some cases, returned permits did not indicate the area fished. There were 35,211 permits issued and 26,772 permits returned for these fisheries.

NA = Data not available.

# CHAPTER 3: NORTON SOUND-PORT CLARENCE AREA AND ARCTIC-KOTZEBUE AREA

## INTRODUCTION

In 2013, the fisheries management district for the North Slope, called the Northern Area, was renamed the Arctic Area. At the same time, management of this area was separated from the Yukon Area and combined with the Kotzebue area. The new fisheries management area is called the Arctic-Kotzebue Area. Previous statewide subsistence fisheries reports have not included information regarding subsistence fisheries on the North Slope, although ongoing division research is attempting to fill this information gap. This chapter has been reorganized and expanded to reflect these changes to the subsistence fisheries management area. It has been expanded to include the results of recent subsistence research conducted in the area, focusing on subsistence fisheries harvest information to supplement the existing annual harvest monitoring program.

## NORTON SOUND–PORT CLARENCE AREA SALMON

### Background

The archaeological record of the Norton Sound–Port Clarence region provides physical evidence of subsistence fishing dating back to the Arctic Small Tool/Norton Tradition, ca. 1500–1000 B.C.E. (Harritt 2010; Smith and Vreeman 1995). The area includes the regional center of Nome, with a 2013 population of 3,656, and 13 smaller communities ranging in size from 119 (Diomede) to 721 (Gambell).[1] Overall, 76% of the residents of the Nome Census Area are Alaska Native, with an additional 6% reporting 2 or more racial backgrounds. More than 90% of the region's population outside of Nome is Alaska Native, with Inupiaq, Yupik, and Siberian Yupik peoples present. Most residents of the region continue to participate in a mixed subsistence-cash economy and depend on wild foods for cultural and nutritional sustenance. While more opportunities for wage work exist in Nome itself, subsistence activities are still an important facet of life to many of its inhabitants.

In summer, subsistence fishers harvest salmon with gillnets or seines in the main Seward Peninsula rivers and coastal marine waters. Beach seines are used near the spawning grounds to harvest schooling or spawning salmon and other species of fish. A major portion of fish taken during the summer months is air dried or smoked for later consumption by residents. Chum and pink salmon are the most abundant salmon species districtwide; Chinook and coho salmon are present throughout the area but are more common in eastern and southern Norton Sound. Sockeye salmon are found in a few Seward Peninsula streams.

### Regulations

The Port Clarence District includes all waters from Cape Douglas north to Cape Prince of Wales, including Salmon Lake and the Pilgrim River drainage. In most of the district, subsistence salmon fishing has few restrictions other than the general statewide provisions. Standard permit conditions include prohibition of fishing within 300 ft of a dam, fish ladder, weir, culvert, or other artificial obstruction. Salmon may be taken in most areas at any time, with no harvest limits. This area includes fishing areas used by residents of Teller, Brevig Mission, and Nome (the area is accessible via road from Nome) (Magdanz 1992:27). Since 2004, subsistence salmon permits have been required in all Port Clarence waters. In addition, in the Pilgrim River drainage, including Salmon Lake and the Kuzitrin drainage, harvests are limited, and specified areas are closed to subsistence salmon fishing. No fishing occurred in

1. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed May 2015. http://labor.alaska.gov/research/pop/popest.htm

Salmon Lake in 2009–2011 due to a crash of the sockeye population—managers had opened a portion of the lake to fishing for the previous 3 years. Prior to that, it had been closed since 1972.

The Norton Sound District encompasses all waters from Point Romanof north to Cape Douglas. It is divided into 6 subdistricts: 1) Nome, 2) Golovin, 3) Moses Point/Elim, 4) Norton Bay, 5) Shaktoolik, and 6) Unalakleet. In subdistricts 1 and 6, restrictions exist on gear, fishing periods, and areas open to fishing. In 2001, a regulatory change by the BOF made rod and reel a legal subsistence fishing gear type in the area from Cape Espenberg on northern Seward Peninsula to Bald Head, which is between Elim and Koyuk. This area includes subsistence fishing areas used by the residents of Nome, White Mountain, Golovin, Elim, Koyuk, Shaktoolik, and Unalakleet. Sport fishing bag and possession limits still apply, except when a subsistence salmon permit is required or fishing through the ice. In the former case, the harvest limits (if any exist) specified on the permit for each river apply. When fishers catch their limit in one drainage, they can fish in another. Subsistence fishing regulations are most restrictive in Subdistrict 1 (Nome) and Subdistrict 6 (Unalakleet), where the 2 largest communities in the area are located.

In Subdistrict 1 (Nome), subsistence harvests consist primarily of chum salmon and pink salmon. Chum salmon runs have been depressed since the mid-1980s, leading to increasing restrictions on all types of harvest. Upstream portions of most rivers are closed to protect spawning salmon, and harvests are limited in all subdistrict rivers. For 16 years, subsistence fishing was prosecuted primarily by emergency order, with openings much less frequent than in regulation. Fishing periods in marine waters were also limited.

From 1991–2005, the Nome Subdistrict was managed primarily by emergency order and was frequently closed to subsistence fishing for chum salmon each year on June 15 until ADF&G judged escapement goals were likely to be met. These closures, even when they were of short duration, impacted subsistence fishing because fishing often reopened during a wetter part of the summer, which made it difficult, if not impossible, to dry and process fish harvested for subsistence uses. From 1999 through 2005, chum salmon fishing in Subdistrict 1 was managed as Tier II, the only such fishery to exist in the state (5 AAC 01.182, 5 AAC 01.184).[2] In 1999, the chum salmon return was so poor that even Tier II fishing was closed; in 2000, only 10 permits were awarded (Soong et al. 2008:10). Chum salmon returns since then have gradually improved, allowing ADF&G to manage the fishery as Tier I between 2006 and 2013, and generally to observe the fishing schedule provided for by regulation.[3] In subdistricts 2 through 4, salmon may be taken at any time, with no harvest limits. However, restrictions exist on commercial fishers' participation in subsistence salmon fishing. Both the escapement and the commercial harvest of chum salmon experienced sharp declines starting in 1990 (Menard and Bergstrom 2006:2); however, the runs have been rebounding in recent years in the Norton Sound District (Menard et al. 2012). In Subdistrict 2 (communities of Golovin and White Mountain), both commercial and subsistence chum salmon harvests have dropped significantly since the 1990s; subsistence restrictions were in place in 2003. Chum salmon stocks in subdistricts 2 and 3 have been classified as stocks of "yield concern" since 2000, but chum salmon runs greatly improved in the late 2000s (Menard et al. 2012:8).

In subdistricts 5 and 6 (Shaktoolik and Unalakleet, respectively), continuing poor Chinook salmon runs have led to restrictions on commercial, sport, and subsistence fishing. The Shaktoolik and Unalakleet subdistricts are typically managed together because actions in one subdistrict are believed to affect the movement of fish in the other. Only 1 commercial Chinook salmon directed fishery has occurred since 2001. Restrictions were placed upon the subsistence and sport fisheries in 2003, 2004, and 2006–2013

2. A "Tier II" subsistence permit program is necessary when the number of participants in a subsistence fishery or hunt must be limited because the harvestable surplus of the fish stock or wildlife population is less than the lower bounds of the amount necessary to provide for subsistence uses. Individual Alaskans are distinguished from one another through the submission of Tier II applications, which are scored based on their history of uses of the particular resource and the ability to obtain alternative food; those with the highest scores receive Tier II permits, the others do not. Tier II provides a process that ensures that subsistence opportunities are provided to those most dependent upon the resource. Tier II implies that there is an insufficient harvestable surplus to provide for all subsistence uses (AS 16.05.258).
3. In a "Tier I" subsistence fishery, all interested Alaska residents may participate. Other fishers (commercial, sport, and personal use) are prohibited or restricted because the harvestable surplus is sufficient only to provide for customary and traditional subsistence uses (AS 16.05.258).

(Menard 2010; Menard et al. 2011, 2012, 2013, 2015). The Chinook salmon management plan adopted by the BOF in February 2007 (5 AAC 04.395) limits subsistence gillnet salmon fishing to two 48-hour fishing periods per week in marine waters from mid-June to mid-July. On the Unalakleet River, subsistence fishing is limited to two 36-hour fishing periods per week. Fishing time could be increased only if ADF&G were to project that the lower end of the sustainable escapement goal (SEG) range would be reached.

In 2007, the BOF changed the classification of Subdistrict 1 chum salmon from a "stock of management concern" to a "stock of yield concern." Subdistricts 2 and 3 chum salmon stocks, as well as subdistricts 5 and 6 Chinook salmon stocks, continued as "stocks of yield concern" (Soong et al. 2008:36).[4]

New state regulations governing customary trade of fish caught in the Norton Sound and Port Clarence areas became effective July 1, 2007. These regulations allowed cash sales, up to $200, of subsistence-caught finfish per household per year. Persons who wanted to participate had to obtain a customary trade record keeping form from Nome ADF&G. Sales could not be made to a fishery business nor the fish resold by the buyer. Sales could also occur only within the Norton Sound–Port Clarence Area (Soong et al. 2008:34). Effective April 13, 2013, the Alaska Board of Fisheries increased the annual limit for selling subsistence-taken finfish as customary trade from $200 per year to $500 total per household in a calendar year (5 AAC 01.188).

## Subsistence Salmon Harvest Data Collection Methods

Two methods were used to assess subsistence salmon harvests in the Norton Sound and Port Clarence districts in 2013: (1) fishing permits in Subdistrict 1 (Nome), the Cape Woolley Area, Subdistrict 2 (Golovin), Subdistrict 3 (Moses Point/Elim), and the Port Clarence District (Brevig Mission and Teller); and (2) postseason household surveys conducted by the Division of Commercial Fisheries in 3 communities: Koyuk in the Norton Bay area (Subdistrict 4), Shaktoolik (Subdistrict 5) and Unalakleet (Subdistrict 6).

### *Norton Sound Subdistricts 1, 2, and 3: Fishing Permits*

Permits have been required for subsistence salmon fishing in Norton Sound Subdistrict 1 (Nome) since 1974. Beginning in 1999, Tier II chum salmon fishing permits were also issued to a limited number of Nome households with the intent that these households would have first priority over other subsistence fishers if only a small number of chum salmon were available for harvest. This priority would allow these households to fish earlier in the season, when weather conditions were more suitable for drying salmon. Tier I fishing permits were available to all other households when run strength was determined to be adequate. In 2013, chum salmon run abundance was projected to achieve the biological escapement goal for the subdistrict and provide amounts reasonably necessary for subsistence. Because of this, a Tier II fishery was not implemented (Menard et al. 2015). The Nome ADF&G office issued 477 subsistence (Tier I) salmon permits, all of which were returned. This was slightly below the 483 permits issued in 2012, but lower than the record 494 permits issued during the 2010 fishing season (Menard et al. 2013) (Table 3-1). A total of 302 households fished their permits, with the largest number of permits fished on the Nome River (173) and Snake River (74) (harvests largely came from those rivers, the Eldorado River, and marine waters) (Menard et al. 2015).

4. The Poilicy for Management of Sustainable Salmon Fisheries (SSFP; 5 AAC 39.222) defines three levels of concern for salmon stocks based on status reports and recommendations from ADF&G. A stock of Yield Concern is defined as "a concern arising from a chronic inability, despite the use of specific management measures, to maintain specific yields, or harvestable surpluses, above a stock's escapement needs; a Yield Concern is less severe than a Management Concern" (5 AAC 39.222(f)(42)). A stock of Management Concern is defined as "a concern arising from a chronic inability, despite the use of specific management measures, to maintain escapements for a salmon stock within the bounds of the SEG, BEG, OEG, or other specified management objectives for the fishery; a Management Concern is not as severe as a Conservation Concern." (5 AAC 39.222(f)(21)). A stock of Conservation Concern is defined as "a concern arising from a chronic inability, despite the use of specific management measures, to maintain escapements for a stock above a sustained escapement threshold (SET); a Conservation Concern is more severe than a Management Concern." (5 AAC 39.222(f)(6)).

Since 1998, the Nome permit data have not been expanded to account for households whose permits were not returned. This contrasts with earlier years when permit data were expanded by drainage, with expansion factors based upon the fraction of unreturned permits for that drainage. ADF&G staff believed that expansion of the permit data led to an overestimation of the salmon harvest because the unreturned permits were most likely from households that did not fish.

Subsistence fishing permits were also issued for the Cape Woolley Area, a traditional camp and fishing area for King Island households, who, although they settled in Nome more than 40 years ago, maintain a distinct community identity. Located in the Norton Sound District west of Nome, this area lies outside Subdistrict 1 but within the boundaries of the area for which fishing permits are required (Rocky Point to Cape Douglas). In 2013, 19 permits were issued for the Cape Woolley Area; all were returned to ADF&G (Table 3-1). Only 3 households fished their permits (Menard et al. 2015).

Subsistence permits have been required for salmon fishing in Subdistrict 2 (Golovin) and Subdistrict 3 (Moses Point/Elim) since 2004. In 2013, 153 permits were issued for Subdistrict 2; more than the 151 permits issued in 2012 and the 145 permits issued in 2011, but fewer than in 2010 (159), 2005 (174) and 2004 (199) (Fall, Braem, et al. 2012a:23; Menard et al. 2013, 2015). All 153 permits were returned (Table 3-1); 97 households reported fishing (Menard et al. 2015). The number of Subdistrict 2 permits issued to Nome residents has dropped since 2004, and fishery managers have attributed the decline to the easing of fishing restrictions in the Nome Subdistrict and rising fuel costs. The number of permits issued to residents of White Mountain and Golovin has held steady. In 2013, ADF&G issued 64 permits for Subdistrict 3, slightly more than the 63 permits issued in 2012 and the 60 permits issued in 2011. All permits were returned; 45 households reported fishing (Menard et al. 2013, 2015) (Table 3-1).

### *Port Clarence District: Salmon Lake and Pilgrim River Fishing Permits*

Permits have been required to fish the Pilgrim River since 1974 (Magdanz 1992:27). This requirement was expanded to all Port Clarence waters in 2004. In 2013, 431 Port Clarence and Pilgrim River permits were issued, compared to 335 in 2012, 271 in 2011, and 295 in 2010 (tables 3-2 and 3-3). Of the permits issued in 2013, a record 265 were to fish the Pilgrim River only; 4 permits were issued for Salmon Lake, marking the first time permits had been issued since 2008; and 162 were issued for other waters in the district (Menard et al. 2015). The number of permits for the Pilgrim River grew substantially between 2003 and 2008, likely in response to several consecutive years of record sockeye salmon runs. The decline in permits issued from 2009 to 2012 may, in turn, be a response to a poor run in 2008 followed by the crash in 2009, when only 953 salmon were counted passing through the weir. Poor runs continued in 2010, with a count of 1,654 salmon. There was improvement to the sockeye run in 2011 (8,449 sockeye salmon passed through the weir) and 2012 (7,085)(Menard et al. 2012, 2015). In 2013, the sockeye run improved dramatically; 12,428 salmon passed through the weir, a 75% improvement over 2012 escapment. All Pilgrim River permits were returned, as well as all the permits issued for other waters of the Port Clarence District.

In 2007, the BOF adopted regulations that closed the southwestern half of Salmon Lake and allowed for fishing on the northeastern half by emergency order. No salmon fishing has been allowed in recent years in Salmon Lake due to the crash of the sockeye salmon run in 2009 and poor runs in 2010–12 (Menard et al. 2013). In 2013, limited fishing in Salmon Lake occurred for the first time since 2008. Managers opened the eastern end of the lake by emergency order in September (Menard et al. 2015).

### ***Household Surveys***

In 2013, ADF&G Division of Commercial Fisheries conducted subsistence fisheries household surveys in Koyuk, Shaktoolik, and Unalakleet. Researchers attempted to contact all of the households in each of the surveyed communities. Actual sample rates varied: 212 of 250 Unalakleet households (85%) were contacted, as were 63 of 68 Shaktoolik households (93%), and 78 of 86 Koyuk households (90%). The

salmon survey data were expanded by community to account for the households not contacted (Table 3-2).

The goals of the postseason household survey were to:

- collect harvest data that would result in a total harvest estimate for subsistence salmon by species and by community;
- compile information on harvest by gear types, participation rates, household size, use of salmon for dog food, and participation in customary barter and trade; and
- assess the quality of chum salmon fishing and what affected it.

## Subsistence Salmon Harvests in 2013

### *Norton Sound District Subsistence Salmon Harvest*

The estimated 2013 subsistence harvest of salmon by communities in the Norton Sound District was 48,271 fish (tables 3-1, 3-3). This was the second lowest total harvest for the district for an odd numbered year on record since 1994, and 31% lower than the average odd year harvest from 1994–2013 (Table 3-3). Pink salmon abundance commonly follows an even–odd year cycle. Their abundance in Norton Sound is usually significantly higher in even-numbered years (2004, 2006, 2008, etc.) with districtwide harvests usually reflecting this difference. Between 1994 and 2013, odd-year harvests of all salmon have ranged from a low of 43,883 in 2011, to a high of 113,612 in 1995, with an average of 70,356 salmon. Even-year harvests have ranged from the low in 2010 of 67,149 to a high of 134,050 in 1996, with an average of 93,475 salmon. Chum salmon abundance in 2013 was expected to provide for both subsistence and commercial harvests, and for the first time in over 20 years, commercial fishing for chum salmon occurred in the Nome Subdistrict. The commerical chum salmon harvest in Norton Sound was the largest in over 25 years, although the run was weaker in Subdistricts 2 and 3. Chum escapement in Subdistrict 1 was the highest in over 20 years, while escapement at the Kwiniuk River tower (Subdistrict 3) was only slightly above the record low in 2012. Southern Norton Sound drainages had strong salmon escapement in 2013. Weak Chinook salmon runs occurred throughout Norton Sound, which required inseason restrictions and early closure to southern Norton Sound subsistence fisheries. A record low 15 Chinook salmon were counted at the Kwiniuk River tower (which has a SEG range of 300–550 fish), and final escapement at the Unalakleet River weir was 767 Chinook salmon (the lowest count in the 4-year project history). Unfortunately, preemptive additional restrictions to marine mesh size and early closures were not sufficient to achieve escapement goals for Chinook salmon in Subdistrict 6. As expected in an odd-numbered year, pink salmon runs were also weak and were only sufficient to provide for subsistence needs and limited commercial fishing openings. In 2013, commercial coho harvests were near record-breaking in Subdistricts 2 and 4, but the heavier harvesting Subdistricts of 5 and 6 were lower than 5 and 10-year averages. Weather during the month of August and high surf conditions may have impacted harvest. Sockeye salmon abundance was plentiful enough to avoid an early closure of the Pilgrim River fishery for the first time since 2008 (Menard et al. 2015).

### *Subdistrict 1 Harvest*

Regulation changes were made at the 2013 Alaska Board of Fisheries meeting, which allowed for subsistence gillnet fishing 7 days a week in marine waters in the eastern half of Subdistrict 1, and beach seining was allowed in all subsistence areas during the chum salmon run when gillnet fishing was open. The Board also passed regulations allowing for a commercial chum salmon fishery in the Subdistrict based on conservative management guidelines. For the eighth year in a row, Subdistrict 1 opened on June 15 for subsistence salmon fishing as per regulation. The chum salmon fishing schedule in marine waters west of Cape Nome (72 hours in marine waters and two 48-hour fishing periods in fresh waters per week) was observed from mid-June to mid-July. By late June and early July, excellent marine subsistence catches of chum salmon were reported, and aerial surveys in mid-July of the eastern Nome Subdistrict

drainages of the Flambeau, Eldorado, and Bonzanza rivers and the western drainage of the Sinuk River observed several thousand chum salmon. The Eldorado River, Nome River, and Snake River weir counts exceeded the chum escapement goal ranges in 2013. Because of this, subsistence gillnet fishing continued on the standard freshwater schedule, and an additional 48 hours were added to the marine schedule for western Subdistrict 1. In addition, several beach seining opportunities were issued via emergency order to increase the efficiency of subsistence chum and pink salmon harvests during periods of good drying weather. Several commercial openings also occurred in mid to late July, permit holders were given 24 hour openings in marine waters from the Cape Nome Jetty eastward to Topkok Head. Overall, the chum salmon subsistence harvest was the fourth highest since 1990. This was somewhat less than expected, however, given chum salmon abundance. Increased fishing opportunity for sockeye salmon at Pilgrim River may have attracted fishers' effort from Subdistrict 1 to the Port Clarence District. While no coho salmon escapement goals have been established for Subdistrict 1, escapement in the Nome and Snake rivers was in the mid-range compared to 10 previous years of sufficient escapment estimates (Menard et al. 2015). The reported 2013 subsistence salmon harvest in the Nome Subdistrict was 3,605 chum salmon, 1,804 coho salmon, 845 pink salmon, 211 sockeye salmon, and 48 Chinook salmon (Table 3-1).

### *Subdistrict 2 and 3 Harvest*

No subsistence catch limits are in place in subdistricts 2 and 3. Most salmon harvested there are caught by residents of the communities of White Mountain, Golovin, and Elim. Pink and chum salmon made up the majority of the salmon harvest, followed by coho, Chinook, and a few sockeye salmon. In 2013, a total of 7,937 salmon were harvested in Subdistrict 2 (Golovin) (Table 3-1), the fourth lowest number in the 2000s (Menard et al. 2015). Pink salmon composed 46% of the number of salmon harvested, with 41% chum, 12% coho, less than 1% Chinook, and less than 1% sockeye salmon making up the rest of the harvest. Early indicators of 2013 chum salmon abundance to the Golovin Subdistrict were limited to scant subsistence catch reports of fair harvests. The Niukluk River counting tower has been used to evaluate escapement in the Golovin Subdistrict from 1995–2012, but the project was eliminated in 2013; the Niukluk River is a tributary of the Fish River, a major salmon producing waterway in the area. Managers had concerns about the chum salmon run in 2013, because at the Kwiniuk River counting tower located in adjacent Subdistrict 3, was having near record low counts. In 16 of the past 18 years, the Niukluk and Kwiniuk counting towers have tracked together on escapement achievement. Aerial surveys did that the Fish River drainage did have greater numbers of chum salmon compared to the Kwiniuk River escapement counts. In mid-July, managers opened directed commercial fishing of pink salmon for one 48 hour period when it was determined that the bulk of the chum salmon run was in the river systems and the Kwiniuk River tower count of pink salmon led managers to believe that escapement goals would be met. On July 20, managers opened an additional 48 commerical fishing window directed at chum salmon. Aerial surveys of the Fish River and Niukluk River indicated that the chum salmon run was late and escapment numbers had greatly improved from the surveys done in beginning of July. An additional chum salmon commercial 24-hour commercial fishing window occurred on July 23, although commercial openings yielded mediocre catches. Commerical coho salmon fishing opened on August 1, and catches were above average during the 24 hour openings. There were 3 more 36-hour fishing periods during the first half of August, followed by three 48 hour openings during the last 2 weeks of the month. Aerial surveys of the Niukluk River and Ophir creek exceeded the survey goal of 950–1900 coho salmon, and harvests were the second highest on record. No restrictions were placed on subsistence fishing. Subdistrict 2 harvests, as noted earlier, largely reflect those of communities within the subdistrict (Menard et al. 2015).

Based upon subsistence fishing permits, residents of Golovin harvested an estimated 3,662 salmon in 2013, the majority of which were chum salmon (48%) and pink salmon (46%) (Table 3-2). Coho salmon harvests (185) contributed 5% to the total salmon harvest, Chinook salmon (43) contributed 1%, and sockeye salmon harvests (13) contributed less than 1% to the total Golovin salmon harvest. White Mountain residents harvested an estimated 3,292 salmon, 1,535 (47%) of which were pink salmon. The

remainder of the harvest was chum salmon (1,289) at 39%, coho salmon (432) at 13%, sockeye salmon (32) at 1%, and Chinook salmon (4) at less than 1%.

In Subdistrict 3 (Moses Point/Elim), early projections of the chum salmon escapement by the Kwiniuk River tower counts indicated a very weak run, and escapement goals were not expected to be met. There could have been commercial openings for pink salmon after July 6, but permit holders were uninterested because of the lower run size of an odd-numbered year. There were 2 commerical openings for chum salmon restricted to the area west of the Kwiniuk River mouth late in the season, but catches were limited. Good catches during the initial 24 hour commercial coho salmon opening and sufficient escapement at the Kwiniuk tower allowed for continued commercial openings of 36 and 48 hour windows for the rest of the season. The number of salmon harvested for subsistence (3,921) was the second lowest since 1994, and Chinook salmon harvest was a record low (Menard et al. 2015). Subsistence fishers harvested an estimated 3,921 salmon, 39% of which were coho salmon. The remainder were 31% chum salmon, 29% pink salmon, 1% Chinook salmon, and less than 1% of the subsistence salmon harvest was sockeye salmon.

### *Subdistrict 4 Harvest*

In 2013, the sixth consecutive annual subsistence salmon survey was conducted in Koyuk by the Division of Commercial Fisheries. Fishers in the subdistrict caught an estimated 6,144 salmon, which ranked fourth heighest out of the last 6 years. Most of the harvest was made up of pink and chum salmon (22% and 63%, respectively). Of the remainder, 13% were coho salmon, and 2% were Chinook salmon. Two sockeye salmon were reported harvested in Subdistrict 4 (Table 3-1). By comparison, in 2012, fishers in the subdistrict harvested an estimated 5,757 salmon, 46% of which were pink salmon (2,623) and 47% chum (2,721). Coho salmon made up 5% of that year's subsistence salmon harvest, another 2% came from Chinook salmon, and there was no harvest of sockeye salmon (Fall et al. 2014).

Table 3-2 presents harvests at the community level. Because of additional harvests in other subdistricts, Koyuk households caught slightly more salmon than the total harvest for the Norton Bay subdistrict. Households harvested an estimated 6,314 salmon, the majority of which were chum salmon (61%) and pink salmon (23%). Households caught lesser amounts of coho (14%), chinook (2%), and sockeye (<1%) salmon.

### *Subdistrict 5 and 6 Harvests*

Preseason forecasts by ADF&G called for another very poor Chinook salmon run to subdistricts 5 and 6. Restrictions were put in place on subsistence fishing per the management plan (5 AAC 04.395). Fishery managers limited fishing time with set gillnets to two 48-hour periods per week in marine waters and two 36-hour periods per week in the Unalakleet River drainage. Fishers were further strongly encouraged to redirect harvest away from Chinook salmon to more abundant chum salmon. Beach seining was permitted beginning on July 1 in order to target abundant chum and pink salmon, but retention of any incidentally caught Chinook salmon was prohibited. The Alaska Board of Fisheries had also passed new regulations in 2013, limiting the size of seining nets to 4.5″ or less and prohibiting the retention of any Chinook salmon with beach seine gear. In order to gauge the early run strength of the chum salmon run and to evaluate the level of incidental catches of Chinook salmon, both subdistricts were given one 12 hour commercial opening in early July, but restricted mesh size of gillnets to 6″ or less. Additional conservation measures were necessary in Subdistrict 6 on subsistence fishing due to the fact that the Unalakleet River drainage was unlikely to make Chinook salmon escapement goals. Marine fishing was restricted to net of 6″ mesh or smaller, and rescinded the fresh water fishing schedule on July 6. Due to evidence that the chum salmon run strength was building, managers opened commercial fishing for one 48 hour windows in Subdistrict 5 on July 8 and one 24 hour period on July 12, with mesh restricted to 6″ or less. Subdistrict 6 was opened for two 24 hour commercial fishing windows for chum salmon on July 8 and July 12. Other commercial openings for both pink and chum salmon occurred in both subdistricts throughout the month of July. On July 22, subsistence salmon fishing was opened 7 days a week with mesh restrictions in place,

and sport fishing for king salmon was closed. Overall, the chum runs in Subdistricts 5 and 6 were above average, and commercial harvests ranked 3rd highest in Subdistrict 5 and the highest on record for Subdistrict 6 in the last 20 years.The near average coho salmon run in both subdistricts allowed for limited commercial fishing and no subsistence restrictions. The decrease in commercial coho salmon harvests in Subdistrict 5 in 2013 can be partially attributed to poor August weather and severe local surf conditions (Menard et al. 2015).

Subsistence fishers in subdistrict 5 (Shaktoolik) caught an estimated 6,719 salmon in 2013, one half of which (3,346 or 50%) were pink salmon. Coho salmon (2,146) composed 32% of the total harvest. The rest of the harvest was composed of chum salmon (983) and Chinook salmon (136), each of which was 15% and 2% of the total, respectively. About 2% of the harvest consisted of sockeye salmon (Table 3-1).

In subdistrict 6 (Unalakleet), subsistence fishers caught an estimated 17,575 salmon, 44% (7,687) of which were pink salmon. Coho salmon (6,088) made up 35% of the annual harvest, followed by chum salmon (3,114 or 18%), and Chinook salmon (466 or 3%). One percent of the total harvest was sockeye salmon (Table 3-1)[5].

Table 3-2 presents harvests at the community level. Because a portion of the respective subdistrict harvests were taken by residents of communities outside of Shaktoolik and Unalakleet, the community harvests are usually slightly different than the total harvest for the individual subdistricts. Households in Shaktoolik harvested the same number of salmon (6,719) as is reported at the Subdistrict level in 2013. Unalakleet households harvested an estimated 17,763 salmon, the majority of which were pink salmon (7,780 or 44%) and coho salmon (6,136 or 35%).

### *Norton Sound Harvest Overall*

Of the total 2013 subsistence salmon harvest in Norton Sound, 1% were sockeye salmon, 2% were Chinook salmon, 28% were coho salmon, 32% were chum salmon, and 37% were pink salmon (Figure 3-1). Total harvest estimates for the Norton Sound District for 1975–2013 are presented in Table 3-5. However, the methods used to determine harvests prior to 1994 are substantially different from those used since 1994. As a consequence, the data are not directly comparable. Methods changed again in 2004 when permits replaced surveys in Norton Sound Subdistrict 2 (Golovin and White Mountain) and Norton Sound Subdistrict 3 (Moses Point/Elim). Very little of the documented 2013 subsistence salmon harvest was taken by residents from outside the district. Twenty-nine subsistence permits were issued to residents of Anchorage, Fairbanks, Eagle River, Kenai, Soldotna, Sitka, Wasilla, Chevak, Barrow, and Palmer; their combined total salmon harvest was 275 salmon (Table 3-2).

### *Port Clarence District Subsistence Salmon Harvest*

The estimated 2013 subsistence harvest of salmon in the Port Clarence District was 14,308 fish (tables 3-3 and 3-4). This harvest was the second highest since 2008 (15,957 fish) and slightly lower than the 10-year average (2003–2012) of 14,520 fish. Of the total salmon harvest, less than 1% was Chinook salmon, 5% were coho salmon, 12% were pink salmon, 37% were sockeye salmon, and 46% were chum salmon, (Figure 3-2).

## ARCTIC-KOTZEBUE AREA SALMON

### Introduction

In 2012, the fisheries management district for the North Slope, called the Northern Area, was renamed the Arctic Area. At the same time, management of this area was separated from the Yukon Area and combined with the Kotzebue Area. The new fisheries management area is called the Arctic-Kotzebue

5. Harvest numbers vary slightly in Subdistrict 6 between this report and Menard et al. (2015). In the manangement report, Subdistrict 6 subsistence harvest numbers are presented as 468 Chinook salmon, 221 sockeye salmon, 6,117 coho salmon, 7,724 pink salmon, and 3,129 chum salmon (total of 17,659 salmon). The difference between these harvest numbers could not be accounted for in analysis.

Area. Previous annual reports have not addressed subsistence fisheries information from the Northern Area, as there have been no annual harvest monitoring programs conducted by ADF&G. Ongoing Division of Subsistence research will serve to expand available information on subsistence fisheries by residents of North Slope communities. Some research results from the North Slope Borough Department of Wildlife Management are also summarized below to better document the extent of subsistence fisheries on the North Slope.

## Background

Arctic Area residents of the North Slope have relied on fish for cultural and nutritional sustenance for generations. The only systematic subsistence fisheries harvest monitoring program has been conducted by the North Slope Borough's (NSB) Department of Wildlife Management (Bacon et al. rev2011). The most recent report by NSB described subsistence fish harvests in the region from 1994–2003; this includes harvest amounts, harvest timing, locations, gear and other qualitative information (Bacon et al. rev2011). Most residents in the region continue to participate in a mixed subsistence-cash economy, harvesting a wide variety of wild foods. The Arctic Area includes the subsistence fishing areas used by Anaktuvuk Pass, Atqasuk, Barrow, Kaktovik, Nuiqsut, Point Hope, Point Lay, and Wainwright. The role of salmon and nonsalmon in the wild food diet varies from community to community and is affected primarily by resource availability. Chum and pink salmon are present in the greatest abundance, although sockeye, coho, and Chinook salmon are occasionally caught. Residents often refer to ocean bright salmon as "silvers" leading to the misidentification of chum harvests as coho salmon in some cases. Nonsalmon species important to subsistence include Arctic grayling, Dolly Varden, lake trout, burbot, rainbow smelt, various whitefishes, Arctic cod, and saffron cod. ADF&G Division of Subsistence has an ongoing subsistence fisheries research project along the western coast of the North Slope [Office of Subsistence Management (OSM) Project No. 12-154, North Slope Emerging Salmon Fisheries], focusing on subsistence fishing harvest and use patterns by residents of Point Lay and Wainwright.

Kotzebue Sound residents have relied on fish for cultural and nutritional sustenance for thousands of years. Most residents in the region continue to participate in a mixed subsistence-cash economy, harvesting a wide variety of wild foods. The Kotzebue Area includes the subsistence fishing areas used by Point Hope, Kivalina, Noatak, Kotzebue, Kiana, Noorvik, Selawik, Ambler, Shungnak, Kobuk, Buckland, Deering, Shishmaref, and Wales. The role of salmon in the wild food diet varies from community to community, and is affected primarily by salmon abundance. Communities that harvest few salmon typically harvest large numbers of nonsalmon fish, such as sheefish *Stenodus leucichthys*, other whitefishes *Prosopium* and *Coregonus* spp., and Dolly Varden *Salvelinius malma.* Along the Noatak and Kobuk rivers, where runs of chum salmon are strong, many households' activities in mid- and late summer revolve around the harvesting, drying, and storing of salmon for use during the winter. Chum salmon predominate in the district, composing 90% of the subsistence salmon harvest. Small numbers of other salmon species are present in the district. ADF&G Division of Subsistence has one ongoing subsistence fisheries research project in the Kotzebue Sound region (OSM Project No. 12-153, Northwest Alaska Key Subsistence Fisheries Harvest Monitoring Program). This research resulted in subsistence fish harvest estimates for 2012, discussed below.

## Regulations

In the Arctic-Kotzebue Area, subsistence salmon fishing has few restrictions, other than the general statewide provisions (e.g., 5 AAC 01.010) and specifications regarding lawful subsistence gear and gear specifications (5 AAC 01.120). Standard conditions include prohibition of fishing within 300 ft of a dam, fish ladder, weir, culvert, or other artificial obstruction. Salmon may be taken in the Arctic-Kotzebue Area at any time with no harvest limits and no required permits. Salmon may be taken only by gillnets, beach seines, or by hook and line attached to a rod or pole, but only in the state waters of, and all flowing waters that drain into the Chukchi Sea or Kotzebue Sound from Cape Espenberg to Cape Prince of Wales (5 AAC 01.120(f)).

Fish other than salmon may be taken by set gillnet, drift gillnet, beach seine, fish wheel, pot, longline, fyke net, dip net, jigging gear, spear, and lead, or, as specified in 5 AAC 01.120(f), by hook and line attached to a rod or pole. In the Kotzebue District, gillnets used to take sheefish may not be more than 50 fathoms in aggregate length nor 12 meshes in depth, nor have a mesh size larger than seven inches (5 AAC 01.120(e)).

Other regulatory restrictions associated with subsistence fishing in the Arctic-Kotzebue Area include the provision that a gillnet may not obstruct more than one-half the width of any fish stream and any channel or side channel of a fish stream. Furthermore, a stationary fishing device may not obstruct more than one-half the width of any salmon stream and any channel or side channel of a salmon stream (5 AAC 01.120(c)). Except when fishing through the ice or when a subsistence fishing permit is required, use of a hook and line attached to a rod or pole between Cape Espenberg and Cape Prince of Wales requires a subsistence fisherman to follow the methods and means specified in sport fishing regulations 5 AAC 70.011 and 5 AAC 70.030, and the bag and possession limits, by species, specified in 5 AAC 70.011.

### Subsistence Salmon Harvest Data Collection Methods

From 1994 through 2004, with funding from the Division of Commercial Fisheries, the Division of Subsistence conducted household surveys in selected Kotzebue Sound communities to collect subsistence salmon harvest data (Fall et al. 2007:23–38). Since funding for that effort has not been available since 2004, no annual surveys have been conducted; therefore, no subsistence salmon harvest estimate is available for 2013, with the exceptions discussed below.[6] The average yearly subsistence harvest between 1994 and 2004 was 59,650 salmon, the majority of which were chum salmon (Table 3-3). This average may be low due to incomplete datasets resulting in low harvest totals for several years during that period. Harvest estimates for 1994, 2002, 2003, and 2004 do not include the regional center of Kotzebue. Because Kotzebue is the largest community in the region, it is believed by area biologists that residents typically harvest as much salmon as residents from all other communities in the region combined (Menard and Kent 2007:1). No harvest information is available for Ambler, a Kobuk River village, for 2001. Data for 2002 include only harvest information from Noatak and Noorvik.

While no Arctic-Kotzebue Area annual subsistence salmon or subsistence fisheries harvest monitoring program is conducted by the Division of Commercial Fisheries, Division of Subsistence collected subsistence fishery harvest information from a number of Arctic-Kotzebue Area communities in 2012 and 2013 as part of other subsistence research projects. These data are presented below.

## ARCTIC-KOTZEBUE AREA SALMON, SHEEFISH, WHITEFISHES, AND ARCTIC CHAR/DOLLY VARDEN

In addition to salmon, major subsistence fisheries take place in the Arctic-Kotzebue Fisheries Management Area for sheefish, other whitefishes, and Dolly Varden (known locally as “trout”). Where salmon are not abundant, these nonsalmon fish often replace salmon in local diets.

Past household surveys to collect harvest information for subsistence salmon harvests in Kotzebue Sound communities also collected harvest data for sheefish, whitefishes, and Dolly Varden in some years (Magdanz et al. 2011:49–50) (tables 3-6 and 3-7).

In 2004, the last year the Kotzebue Area was surveyed, nonsalmon harvest information was collected in Ambler, Kiana, Kobuk, Noatak, Noorvik, and Shungnak. Those 6 communities harvested an estimated 10,835 sheefish, 50,501 whitefishes, and 11,697 Dolly Varden in that year (Fall et al. 2007:33). Kotzebue Area’s total harvest of those species is probably higher, but subsistence fish surveys are not usually conducted in other villages. Additional fish harvest information is available for 2008 in the communities of Noatak and Kivalina as a part of comprehensive harvest surveys associated with a supplemental

6. Although the subsistence salmon harvest surveys were eliminated in 2004, information on subsistence fish harvests has been collected occasionally since then during comprehensive subsistence harvest surveys and other projects in some Northwest Alaska communities.

environmental impact statement for the Red Dog Mine (Magdanz et al. 2010). Fish harvest data also exist for Selawik as a portion of a 2011 comprehensive survey effort (Braem et al. 2013).

Division of Subsistence collected fish harvest data for 2012 in the upper Kobuk River communities of Ambler, Shungnak, and Kobuk as a part of a comprehensive subsistence harvest survey associated with proposed development activities in the Ambler Mining District (Braem et al. 2015). In another project, Division staff also collected fish harvest data in Noorvik for 2012 as a part of a comprehensive survey effort (Braem et al. *in prep*) [7]. The Division of Subsistence's Office of Subsistence Management (OSM) project, entitled "Northwest Alaska Key Subsistence Fisheries" documented subsistence fishery harvests in Kiana, and Noatak for 2012 and 2013. This project is 3 years in scope, and also includes Ambler, Shungnak, Kobuk, Noorvik, Selawik, and Buckland in the 2013 study year (Braem and Kostick *In prep).*[8]

In 2012, Ambler households harvested an estimated 59,432 lb of fish, the majority of which (78%) came from various whitefish species. Broad whitefish made up the largest component of the fish harvest (9,150 fish, 36,601 edible pounds) representing 22% of the total estimated subsistence harvest, followed by chum salmon (1,621 fish, 9,214 edible pounds), which represented 6% of the total subsistence harvest. Ambler residents harvested 10,096 edible pounds of salmon in 2012, accounting for 17% of the total fish harvests. Chum salmon harvest were the greatest, accounting for 91% of the total salmon harvest, followed by 126 sockeye salmon, 12 coho salmon, 9 pink salmon, and 2 Chinook salmon. Forty-seven percent of Ambler households reported using less salmon in 2012 than in previous years. Nonsalmon fishes accounted for 83% of the total Ambler fish harvest in 2012, and 30% of the estimated total subsistence harvest, with an estimated harvest of 49,336 edible pounds. The largest contributions to nonsalmon fish harvests were broad whitefish, followed by 1,156 sheefish, 1,544 humpback whitefish, 568 northern pike, 948 Arctic grayling, and 146 burbot (Braem et al. 2015).

In 2013, Ambler households harvested an estimated 75,436 lb of fish, of which 60% came from various whitefish species. Sheefish made up the largest component of the fish harvest (2,649 fish, 29,505 edible lb), and composed 39% of the total harvest. Chum salmon was the second largest component of the harvest (4,321 fish, 24,540 edible lb), and represented 32% of the total harvest. Other salmon harvests included 260 pink salmon, 187 coho salmon, 9 sockeye salmon, and 8 Chinook salmon. Salmon harvests in 2013 were 162% greater than 2012 harvests, likely due to the very poor weather conditions in northwest Alaska in 2012. Nonsalmon fishes accounted for 65% of the total Ambler fish harvest in 2013. The largest contributions to nonsalmon fish harvests were sheefish, followed by 3,496 broad whitefish, 2,301 humpback whitefish, 673 northern pike, 646 Arctic grayling, and 175 Dolly Varden.

Shungnak households harvested an estimated 15,417 edible pounds of salmon in 2012, accounting for 50% of the total fish harvests. Chum salmon harvests (2,595 fish) were the greatest, accounting for 96% of the total salmon harvest by weight, followed by 90 sockeye salmon, 15 coho salmon, and 9 pink salmon. Fifty-two percent of Shungnak households reported using less salmon in 2012 than in previous years. Nonsalmon fishes accounted for 50% of the total fish harvest, and 17% of the estimated total subsistence harvest, with an estimated total nonsalmon harvest of 15,223 edible pounds. The largest contributions to nonsalmon fish harvests were 1,556 sheefish, 1,125 least cisco, 888 broad whitefish, 660 humpback whitefish, 399 Arctic grayling, 99 Dolly Varden, 75 Bering cisco, 50 burbot, and 38 northern pike (Braem et al. 2015).

In 2013, Shungnak household harvested a total of 101,203 edible lb of fish, of which 41% (7,257 fish, 41,222 edible lb) were chum salmon. Fishers did not report catching any other kinds of salmon. Salmon harvests were 167% greater in 2013 compared to the 2012 study year. Nonsalmon fishes accounted for 59% of the total harvest in 2013, a total of 59,980 edible lb. The largest contributions to the nonsalmon

fish harvest were 3,559 sheefish, 8,400 humpback whitefish, 578 broad whitefish, 127 northern pike, and 110 Arctic grayling.

Kobuk residents harvested 15,142 edible pounds of salmon in 2012, accounting for 65% of the total fish harvests. Chum salmon harvests (2,637 fish) were the greatest, accounting for 99% of the total salmon harvest, followed by 14 coho salmon, 4 pink salmon, and 4 Chinook salmon. Seventy percent of Kobuk households reported using less salmon in 2012 than in previous years. Nonsalmon fishes accounted for 35% of the total fish harvest, and 19% of the estimated total subsistence harvest, with an estimated total harvest of 8,329 edible pounds. The largest contributions to nonsalmon fish harvests were 1,062 sheefish, 286 broad whitefish, 256 Arctic grayling, 157 humpback whitefish, 96 Northern pike, 40 Dolly Varden, and 23 burbot (Braem et al. 2015).

In 2013, Kobuk residents harvested 11,845 edible pounds of salmon, accounting for 21% of the total fish harvest. The vast majority the salmon harvest was chum salmon (2,076 fish, 11,790 edible pounds), and residents reported limited harvest of Chinook salmon (3 fish), pink salmon (9), and sockeye salmon (1). 2013 salmon harvests were 22% less than 2012 harvests. Nonsalmon fishes composed 79% of the total fish harvest. The largest contributions to the nonsalmon harvest were 13,729 unknown whitefish (respondents were unable to identify which species), 1,382 humpback whitefish, 1,337 broad whitefish, 865 sheefish, and 140 Arctic grayling (Braem and Kostick *In prep*).

In a separate study, the Division of Subsistence collected subsistence fishery harvest data from Noorvik for 2012 and 2013. Noorvik residents harvested 60,326 edible pounds of salmon in 2012, accounting for 31% of the total fish harvests. Chum salmon harvests (9,584 fish) were the greatest, accounting for 95% of the total salmon harvest by weight, followed by 338 coho salmon, 275 pink salmon, 81 sockeye salmon, and 7 Chinook salmon. Forty-seven percent of Noorvik households reported using less salmon than in previous years. Nonsalmon fishes accounted for 69% of the total fish harvest, and 38% of the estimated total subsistence harvest, with an estimated total harvest of 135,274 edible pounds. The largest contributions to nonsalmon fish harvests were 6,032 sheefish, representing 67,197 edible pounds and the second largest species contribution to the total subsistence harvest following caribou. Noorvik residents also harvested 10,087 broad whitefish, 5,134 northern pike, 6,406 humpback whitefish, 876 burbot, 1,445 least cisco, and 99 Dolly Varden. Information about other fish harvests will be summarized in the technical report (Braem et al. 2015).

In 2013, Noorvik households harvested 269,328 lb of fish, of which 45% were salmon species. Chum salmon was the largest contribution to the total fish harvest (19,972 fish, 113,441 edible lb), and residents reported lesser harvests of coho salmon (1,207 fish), pink salmon (173), Chinook salmon (37), and sockeye salmon (15). Salmon harvests were 99% greater in 2013 compared to the 2012 study year. Nonsalmon fishes composed 55% of the total fish harvest. The largest contributors to the nonsalmon harvest were 14,380 broad whitefish, 3,167 sheefish, 15,945 humpback whitefish, 7,932 northern pike, and 3,929 least cisco (Braem and Kostick *In prep*).

The Division of Subsistence's Office of Subsistence Management (OSM) project, entitled "Northwest Alaska Key Subsistence Fisheries" documented subsistence fishery harvests in Kiana and Noatak for 2012 and 2013. Data was collected for Selawik and Buckland in 2013. Kiana residents harvested 16,975 edible pounds of salmon in 2012, accounting for 30% of the total fish harvests. Chum salmon harvests (2,442 fish) were the greatest, accounting for 86% of the total salmon harvest by weight, followed by 320 pink salmon, 240 coho salmon, 63 sockeye salmon, 3 Chinook salmon, and 8 unknown salmon. Twenty percent of Kiana households reported using less salmon in 2012 than in previous years. Nonsalmon fishes accounted for 70% of the total fish harvest, with an estimated total harvest of 39,955 edible pounds. The largest contributions to nonsalmon fish harvests included 1,787 sheefish, 3,596 broad whitefish, 2,307 humpback whitefish, 464 burbot, 278 northern pike, and 250 Dolly Varden.

In 2013, Kiana households harvested 18,554 lb of salmon, accounting for 33% of the total fish harvest. Chum salmon accounted for 91% of the salmon harvest (2,969 fish), followed by 212 pink salmon, 161

coho salmon, 37 sockeye salmon, and 5 Chinook salmon, and an additional 12 salmon of unknown species. Nonsalmon fishes accounted for 67% of the total fish harvest, with an estimated total harvest of 38,100 edible lb. The greatest contributors to the nonsalmon fish harvest included 1,787 sheefish, 2,832 broad whitefish, 3,251 humpback whitefish, 316 burbot, and 242 northern pike (Braem and Kostick *In prep*).

Noatak residents harvested 50,721 edible pounds of salmon in 2012, accounting for 62% of the total fish harvests. Chum salmon harvests (7,814 fish) were the greatest, accounting for 92% of the total salmon harvest by weight, followed by 612 coho salmon, 94 sockeye salmon, 80 pink salmon, and 2 Chinook salmon. Forty-seven percent of Noatak households reported using less salmon in 2012 than in previous years. Nonsalmon fishes accounted for 38% of the total fish harvest, with an estimated total harvest of 30,849 edible pounds. The largest contributions to nonsalmon fish harvests included 6,437 Dolly Varden (called "trout" by Noatak residents), 1,826 broad whitefish, 1,205 humpback whitefish, 100 sheefish, 352 Arctic grayling, and 26 northern pike.

In 2013, Noatak residents harvested 38,236 edible lb of salmon, accounting for 55% of the total fish harvest. Chum salmon harvests (5,655 fish) were the greatest, accounting for 84% of the total salmon harvest by weight. Households reported lesser harvests of coho salmon (1,233 fish), pink salmon (32), and Chinook salmon (5). Nonsalmon fishes accounted for 45% of the total fish harvest (31,772 edible lb). The largest contributions to the nonsalmon fish harvest included 6,223 Dolly Varden, 2,219 broad whitefish, 247 sheefish, 358 humpback whitefish, and 93 least cisco.

Selawik residents harvested 234,995 edible lb of fish in 2013, of which only 2,109 edible pounds (1% of the total fish harvest) were salmon. Households reported harvesting 362 chum salmon, 15 pink salmon, and 1 Chinook salmon. Nonsalmon harvests were 99% of the total fish harvest, an estimated 232,886 edible lb. Sheefish contributed the most to the nonsalmon fish harvest, 98,353 edible lb (8,829 fish), followed by 23,159 broad whitefish, 10,593 northern pike, 7,648 humpback whitefish, 4,670 least cisco, and 795 burbot.

Buckland residents harvested an estimated 55,159 edible lb of fish in 2013, of which 46% were salmon. Chum salmon contributed 70% of the total salmon harvest (3,104 fish, 17,631edible lb), followed by 838 coho salmon, 236 sockeye salmon, 226 Chinook salmon, 129 pink salmon, and 1 unknown salmon. Nonsalmon fishes accounted for 54% of the total fish harvest. The largest contributor to the nonsalmon harvest was smelt (2,069 gallons, 12,414 edible lb), followed by 1,007 sheefish, 1,118 humpback whitefish, 333 broad whitefish, 312 Dolly Varden, and 246 northern pike (Braem and Kostick *In prep*).

Division of Subsistence conducted comprehensive subsistence research in Point Lay on the western North Slope of Alaska in 2012, and conducted fish harvest surveys in 2013 as a part of the OSM project, entitled "Emerging North Slope Salmon Fisheries". Point Lay residents harvested 8,479 edible pounds of salmon in 2012, accounting for 58% of the total fish harvests. Chum salmon harvests (659 fish) were the greatest, accounting for 47% of the total salmon harvest by weight, followed by 1,120 pink salmon, 372 coho salmon, 14 Chinook salmon, and 13 sockeye salmon. Twenty-six percent of Point Lay households reported using less salmon in 2012 than in previous years. Nonsalmon fishes accounted for 42% of the total fish harvest, and 5% of the estimated total subsistence harvest, with an estimated total harvest of 6,076 edible pounds. The largest contributions to nonsalmon fish harvests included 1,945 Arctic grayling, 493 Dolly Varden, 279 Bering cisco, 99 gallons unknown smelt, 279 round whitefish, and 37 sheefish. Information about other fish harvests will be presented in the technical report (Braem et al. 2015).

In 2013, Point Lay households harvested less fish overall than in the 2012 study year. Residents harvested an estimated 5,106 edible lb of fish, of which 26% (1,346 edible lb) were salmon species. Chum salmon accounted for the largest portion of the salmon harvest (72%, 157 fish), followed by pink salmon (17%, 84 fish), 30 sockeye salmon, and 3 coho salmon. Nonsalmon species accounted for 73% of the total fish harvest, with Arctic grayling contributing 71% of the total nonsalmon fish harvest by weight (2,670 fish).

Point Lay nonsalmon fish harvests also included 131 gallons of smelt, 20 Dolly Varden/Arctic char, and 8 humpback whitefish.

The Division of Subsistence's OSM project, entitled "Emerging North Slope Salmon Fisheries" also documented subsistence fishery harvests in Wainwright for 2012 and 2013. Wainwright residents harvested 1,711 edible pounds of salmon in 2012, accounting for 5% of the total fish harvests. Coho salmon represented the greatest contribution to salmon harvest by weight, with 105 coho salmon harvested, followed by 66 sockeye salmon, 51 chum salmon, 136 pink salmon, and 20 Chinook salmon. Seventeen percent of Wainwright households reported using less salmon in 2012 than in previous years. Nonsalmon fishes accounted for 95% of the total fish harvest, with an estimated total of 31,801 edible pounds. The largest contributions to nonsalmon fish harvests included 3,489 gallons of smelt (20,935 edible pounds), 1,562 broad whitefish, 1,606 humpback whitefish, 648 Bering cisco, 7,513 Arctic grayling, 101 burbot, 624 least cisco, 20 lake trout, and 20 flounder.

In 2013, Wainwright residents harvested 3,357 edible pounds of salmon, accounting for 10% of the total fish harvest. Chum salmon contributed the most to the salmon harvest by weight (33% of the salmon harvest, 180 fish, followed by 144 coho salmon, 154 pink salmon, 121 sockeye salmon, and 62 Chinook salmon. Nonsalmon fishes accounted for 90% of the total fish harvests, totaling 29,374 edible pounds. Smelt contributed slightly over one half (51%) to the nonsalmon fish harvest; Wainwright residents reported harvesting 2,536 gallons of smelt in 2013. Other nonsalmon harvests included a total of 7,373 whitefishes (Bering cisco, least cisco, Arctic cisco, broad whitefish, humpack whitefish, and round whitefish), 3,056 Arctic grayling, 62 Dolly Varden/Arctic char, and 38 sheefish (Mikow et al. *In prep*)[9].

### *Arctic-Kotzebue Area Salmon Harvest Overall*

Of the 2013 harvest of salmon in the Kotzebue Area for which we have data, the 8 communities harvested an estimated 50,754 salmon. The vast majority of the harvest was chum salmon (90%), followed by coho salmon (7%), pink salmon (2%), sockeye salmon (<1%), and Chinook salmon (<1%) (Table 3-8; Figure 3-3).

Of the 2013 harvest of salmon in the Arctic Area for which we have data, the 2 communities harvested an estimated 935 salmon. The majority of the harvest was chum salmon (36%), followed by pink salmon (25%), coho salmon (16%), sockeye salmon (16%), and Chinook salmon (7%) (Table 3-9; Figure 3-4).

*Source* ADF&G Division of Subsistence, ASFDB 2014 (ADF&G 2015).

a. Includes Gambell and Savoonga.

b. Normally includes Ambler, Kiana, Kobuk, Kotzebue, Noatak, Noorvik, and Shungnak.

c. Includes Deering and Wales; does not include Kotzebue.

d. Includes Shishmaref.

e. Does not include Ambler.

f. Includes only Noatak and Noorvik.

g. Does not include Kotzebue.

h. Due to lack of funding, no collection of subsistence salmon harvest data took place in Kotzebue area communitiesfrom 2005–2011. The average yearly subsistence harvest of salmon in the Kotzebue area between 1994 and 2004 was 59,650 fish.

i. Formerly Kotzebue Area.

j. Limited data exist in 2006, 2007 and 2011 for Kiana (2006), Kivalina (2007), Noatak (2007), and Selawik (2011). These are available online through the Community Subsistence Information System (CSIS) at http://www.adfg.alaska.gov/sb/CSIS/

k. Includes Point Lay and Wainwright.

ND = no data.

Table 3-4.–Subsistence salmon harvests by district, Northwest Alaska, 2013.

| District | Households surveyed or permits returned | Estimated salmon harvest[a] | | | | | |
|---|---|---|---|---|---|---|---|
| | | Chinook | Sockeye | Coho | Chum | Pink | Total |
| Norton Sound District[b] | 1,062 | 859 | 571 | 13,343 | 15,491 | 18,007 | 48,271 |
| Port Clarence District[c] | 431 | 38 | 5,243 | 651 | 6,588 | 1,788 | 14,308 |
| Kotzebue District[d,f] | 618 | 285 | 298 | 3,626 | 45,715 | 830 | 50,754 |
| Arctic District | 122 | 62 | 151 | 147 | 337 | 238 | 935 |
| **Total[e]** | **1,819** | **1,244** | **6,263** | **17,767** | **68,131** | **20,863** | **114,268** |

*Source* ADF&G Division of Subsistence, ASFDB 2014 (ADF&G 2015).

a. Harvests reported during household surveys are expanded into estimates to account for uncontacted households. Harvests reported on permits are not expanded.

b. Household surveys conducted in Unalakleet, Koyuk, and Shaktoolik. Permits issued for Cape Woolley, Nome Subdistrict (Tier I), Golovin Subdistrict, and Elim Subdistrict.

c. Permits issued for Port Clarence District, Pilgrim River, and Salmon Lake.

d. Due to lack of funding, no collection of subsistence salmon harvest data took place in Kotzebue Sound communities from 2005–2011. The average yearly subsistence harvest of salmon in the Kotzebue area between 1994 and 2004 was 59,650 fish.

e. Households surveyed or permits returned column does not add up to the total shown above due to individual households fishing in multiple districts.

f. Formerly Kotzebue Area.

ND = no data

Table 3-5.–Page 2 of 2.

*Source* ADF&G Division of Subsistence, ASFDB 2014 (ADF&G 2015).

*Note* Since 1994 ADF&G has conducted an annual subsistence salmon harvest assessment effort in Northwest Alaska that provides more extensive and reliable estimates. Harvest estimates prior to 1994 cannot be directly compared.

a. Includes selected communities in the Norton Sound District, Port Clarence District, Arctic District, and Kotzebue District (formerly Kotzebue Area).

b. Includes Shishmaref.

c. Includes Gambell and Savoonga.

d. Does not include Ambler.

e. For the Kotzebue District, includes only Noatak and Noorvik.

f. Does not include Kotzebue.

g. Does not include Koyuk.

h. Does not include Kotzebue District.

i. For the Arctic District, includes only Point Lay and Wainwright.

# CHAPTER 4: YUKON AREA

## BACKGROUND

Residents of the Yukon River drainage have long relied on fish for human food and other subsistence uses. While nonsalmon fish species are an important component of the overall fish harvest (Andersen et al. 2004; Brown et al. 2005), large numbers of Chinook salmon, summer and fall chum salmon, and coho salmon compose the majority of all subsistence harvests of fish in the Yukon River drainage. Indeed, subsistence salmon harvests have occurred alongside robust commercial, sport, and personal use harvests across species.

Yukon Area fishers use drift gillnets, set gillnets, and fish wheels to harvest the majority of salmon. Set gillnets are used throughout the Yukon Area, often in the main rivers and coastal marine waters. Drift gillnets are used extensively in about half of the river. Under state regulations, drift gillnets are allowed from the mouth of the Yukon River to approximately 18 miles downriver of Galena, and under federal permit in subdistricts 4B and 4C. Fish wheels are a legal subsistence gear type throughout the Yukon drainage, although due to river conditions and the availability of wood for building materials, they are used almost exclusively on the middle and upper Yukon and Tanana rivers.

Depending on the area of the Yukon River drainage and each salmon species' run timing, subsistence fishing for salmon occurs from late May through mid October. Subsistence harvesters usually base their fishing activities either from fish camps or from their home communities. Extended family groups, typically representing several households, often participate in subsistence salmon fishing together. Households and related individuals typically cooperate to harvest, process, preserve, and store salmon for subsistence uses.[1]

The majority of the subsistence salmon harvest is preserved for later uses by freezing, drying, or smoking; the head, viscera, backbones, and other scraps are often fed to dogs. Chinook salmon are harvested and processed primarily for human consumption, although those fish deemed not suitable for human consumption due to the presence of the fungus *Ichthyophonus hoferi* or some other disease or abnormality are often fed to dogs. Small male Chinook salmon ("jacks") or spawned-out salmon may also be fed to dogs. In addition, while fishers harvest chum and coho salmon primarily for human consumption, dog mushers harvest and process relatively large numbers of these species as food for sled dogs. Fall chum salmon and coho salmon typically arrive in the upper portion of the drainage late in the season, coinciding with freezing weather, during which time some dog mushers "crib" salmon for use as dog food. This method involves storing whole salmon outdoors in large wooden boxes or log cribs in late fall, and allowing them to freeze (Andersen 1992). The practice of keeping sled dogs is much more common in communities along the upper Yukon River than in the lower river area.

## REGULATIONS

Regulation and management of Yukon River drainage subsistence salmon fishing follows the Yukon River Drainage Subsistence Salmon Fishery Management Protocol, which provides a framework for coordinated subsistence fisheries management between ADF&G and the federal subsistence management programs in the Yukon River drainage. This protocol is applied through a Memorandum of Agreement between state and federal agencies which formalizes the working relationships between state and federal managers and fosters cooperation with federal regional advisory councils and fisheries interest groups. State managers are responsible for management of state subsistence, commercial, recreational, and personal use fisheries in all waters. Federal managers are responsible for management of subsistence fishing by qualified rural residents in applicable federal waters. The protocol also directs state and federal managers to solicit input from the Yukon River Drainage Fisheries Association (YRDFA), the Yukon

1. For more detail on subsistence uses of Yukon River salmon, see ADF&G 1987a–b, 1988.

River Coordinating Fisheries Committee (YRCFC), and other stakeholders during the decision-making process.

The majority of the United States' portion of the Yukon Area is open to subsistence fishing. However, the Joint Board has defined a portion of the Tanana River in the Yukon River drainage as lying within the Fairbanks Nonsubsistence Area (5 AAC 99.015). Subsistence fisheries may not be authorized within nonsubsistence areas; the harvest of fish for home uses in these nonsubsistence areas occurs under personal use and sport fishing regulations.

In 2011 area managers implemented a 2010 Board of Fisheries decision to reduce the maximum stretched mesh net size to 7.5″. Prior to this, Yukon Area fishers widely used 8″-8.5″ mesh nets to target Chinook salmon. This change was considered a conservation tool to allow more of the older and larger Chinook salmon, especially females, to escape to the spawning grounds. During the spring of 2011, in cooperation with the Pacific States Marine Fisheries Commission (PSMFC), the Tanana Chiefs Conference (TCC) administered a net exchange program to help fishermen comply with this new regulation. Eligible fishermen could send in their 8″ or larger mesh nets in exchange for new, 7.5″ mesh nets (Frothingham 2011). Kwik'pak Fisheries, LLC, a community-based economic development organization in the lower Yukon River, also facilitated a net exchange program in lower river communities. However, restrictions in the subsistence fisheries necessary for conservation in the following years (discussed below) have kept fishermen from actually using these new nets to date.

Over the last 2 decades, several other regulatory changes have affected the subsistence salmon fishery in the Yukon River drainage. In 1993, the BOF adopted regulations which separated subsistence and commercial salmon fishing times in districts 1, 2, and 3 and in the lower portion of District 4 (Subdistrict 4A) (figures 4-1 and 4-2). In these areas, subsistence salmon fishing is allowed 7 days per week but may not occur 24 hours prior to and immediately following the commercial salmon fishing season. By regulation, once the commercial season is open, subsistence salmon fishing may not occur 18 hours immediately before, during, and 12 hours after each district 1, 2, or 3 summer season commercial fishing period unless altered by emergency order. During the fall season in districts 1, 2, and 3, subsistence fishing may not occur 12 hours immediately before, during, and 12 hours after each commercial fishing period. In areas including and upriver from subdistrict 4B, subsistence salmon fishing periods coincide with commercial salmon fishing periods. Since 1988, subsistence fishing in the lower Tanana River drainage in subdistricts 6A and 6B has been allowed for two 42-hour periods per week unless altered by emergency order.[2] In the upper Tanana River drainage upstream of the Volkmar (north bank) and Johnson (south bank)[3] rivers, subsistence fishing is allowed 7 days per week.

In 2005, the Federal Subsistence Board (FSB) established a subsistence drift gillnet fishery in subdistricts 4B and 4C, which includes the mainstem Yukon River villages of Galena and Ruby. Participation in this fishery was open to qualified rural residents under a federal subsistence permit, and limited to gillnets that were no longer than 150 ft and no deeper than 35 meshes. The mesh size was unrestricted so as to target Chinook salmon. In previous years, the regulation allowed drift gillnet fishing in the last 18 hours of each subsistence salmon fishing opening in the federal public waters of subdistricts 4B and 4C. However, in 2008, the FSB liberalized the regulation to align it with the regulatory openings, usually two 42-hour periods per week.

2. In the lower Tanana River drainage, the fishery to harvest salmon for home uses in Subdistrict 6C is a personal use fishery. Its fishing schedule matches those of the 6A and 6B subsistence salmon fisheries; namely, that personal use fishing is allowed for two 42-hour periods per week unless altered by emergency order. In that portion of Subdistrict 6B from the downstream side of the upper Tolovana River to 3 miles upstream of Totchaket Slough (the Old Minto area), subsistence fishing is allowed 5 days per week.

3. Salmon fishing is closed in that portion of the Tanana River drainage upstream of Subdistrict 6C, from the Salcha River upstream to the Volkmar River (north bank) and to the Johnson River (south bank). The area is closed to salmon fishing other than sport fishing and is included in the Fairbanks Nonsubsistence Area. Whitefishes and longnose suckers may be harvested upstream of the Salcha River under a personal use permit.

Since 1996, Yukon River salmon stocks have fluctuated in terms of abundance. The distastrous runs of all species in 2000 resulted in subsistence restrictions late in the summer subsistence salmon season to protect Chinook salmon and summer chum salmon populations. Because of the inability to maintain expected yields and harvestable surpluses above escapement goals for several years, the BOF classified the Yukon River Chinook salmon stock as a stock of yield concern at its September 2000 work session (Lingnau and Salomone 2003). After a modest increase in Chinook salmon abundance from 2004 to 2007, more severe restrictions were imposed on the summer season to protect declining Chinook salmon runs beginning in 2008. Restrictions have been implemented through both period closures and limited gear use in all districts. During its January 2010 and 2013 meetings in Fairbanks, the BOF continued the stock of yield concern designation for Yukon River Chinook salmon.[4]

Fall chum salmon returns have also been variable over time. Restrictions on subsistence fall season salmon fishing occurred intermittently throughout the 1990s. There was a complete closure of the fall season in 2000 severely affecting the subsistence harvest of fall chum and coho salmon. In 2001 the BOF declared Yukon fall chum salmon a stock of concern. In 2007, after the returns of fall chum rebounded, the BOF lifted the stock of concern designation.

In 2001, as a result of the disastrous runs the year before, the BOF instituted a new subsistence schedule on the Yukon River based on historical subsistence fishing opportunities structured around commercial openings, commonly referred to as the "windows" schedule. The schedule was intended to fulfill several goals: 1) increase the quality of escapement, 2) distribute subsistence opportunity among users during years with no commercial fishing, and 3) reduce the impact of harvest on any one stock by spreading the harvest throughout the run, thereby providing windows of time that salmon may migrate upriver with reduced exploitation. The schedule, based on past fishing schedules, is initiated each year based on the historical average time of Chinook salmon entry into the Yukon River. Once initiated, the schedule is implemented chronologically upriver. The BOF determined that the schedule provides reasonable opportunity for subsistence users to achieve their harvest goals when salmon runs are below average. Subsistence fishing is allowed 7 days per week in all areas prior to the established schedule dates. In 2003, the BOF clarified the window schedule to allow ADF&G to relax the schedule if Chinook salmon run abundance allowed commercial fishing.

Preseason outlooks for 2013 projected a poor Chinook salmon run (98,000-144,000) (JTC 2014:4), especially for Canadian-origin fish. YRDFA facilitated a pre-season meeting for managers, fishers, and other stakeholders to discuss options and develop a preseason plan. The results of this meeting were summarized in an informational flyer that was distributed to approximately 2,900 Yukon River households (JTC 2014:5). The 2013 subsistence fishing schedule for the Lower Yukon Area is presented in Table 4-1. Table 4-2 displays the 2013 subsistence fishing schedule for the Upper Yukon Area, and Table 4-3 displays the schedule for the Old Minto Area, Tanana River, and Koyukuk River Historically, the windows schedule began around May 28 in District 1. In 2013, the regulatory subsistence fishing schedule began on May 30. The summer chum salmon run was expected to be similar to the run in 2012 of approximately 1.5 to 1.8 million fish and to provide for escapements, a normal subsistence harvest, and a surplus for commercial harvest. A projected run of 900,000–1,200,000 fall chum salmon was expected to provide for escapement, subsistence harvests, and a projected commercial harvest of 500,000–700,000 fish. Coho salmon runs were projected to be of below average to average strength, around 137,000 fish, based on escapements observed in 2009.[5]

Throughout the season, emergency orders were issued to modify the subsistence fishing schedule to protect Chinook salmon. Ice break up in the lower river occurred on June 3, which was considerably later than the average of May 23, and the first Chinook salmon was caught by ADF&G test nets on June 10

4. Alaska Department of Fish and Game Division of Commercial Fisheries. "Yukon Area regulatory changes," news release, January 25, 2013. Accessed August 2014. http://www.adfg.alaska.gov/static/applications/dcfnewsrelease/245219141.pdf

5. Alaska Department of Fish and Game Division of Commercial Fisheries. "2013 Yukon River Fall Season Summary," news release, November 27, 2013. Accessed June 2015. http://www.adfg.alaska.gov/static/applications/dcfnewsrelease/376437276.pdf

(JTC 2014:6). Consistent with the new regulation requiring closure of the first pulse of Chinook salmon for conservation purposes, subsistence closures were initiated in District 1 and the northern portion of the Coastal District on June 20 and implemented chronologically upriver as the pulse migrated. As the Chinook salmon migration progressed upriver, managers were increasingly concerned that the run was very weak and insufficient to meet all escapement objectives. In order to try to meet escapement goals, managers protected each of the subsequent 3 pulses of Chinook salmon in Districts 1–5 and only offered very limited fishing opportunities between pulses to allow for the harvest of summer chum salmon and other nonsalmon speciesDuring these openings, gill nets were restricted to 6-inch mesh or smaller and in upper Yukon River districts, fishermen could use fishwheels with the stipulation that all Chinook salmon would be released back to the water unharmed. Low passage numbers at Eagle sonar necessitated further restrictions in Subdistrict 5-D; as a result, subsistence closures were most pronounced in Subdistrict 5-D (JTC 2014:8).

During the preseason, it was considered unlikely that there would be a directed commercial Chinook salmon fishery given previous years' failures to meet minimum treaty escapement goals for Canadian Chinook salmon and because of the likely restrictions on the subsistence fishery. Ultimately, given the need for subsistence restrictions indicated by the preseason outlook and early inseason indicators, ADF&G did not authorize any commercial fishing periods targeting Chinook salmon on the mainstem Yukon River.

Preseason projections expected the 2013 summer chum run to be average, to provide for escapement and subsistence uses, and to have a surplus for commercial harvest, noted above. A harvestable surplus of summer chum has been available for the last 10 years (2004–2013). Because of the concurrent run timing of Chinook and summer chum salmon, managers expected that the conservative management strategies, designed to protect a poor Chinook salmon run, would affect and reduce the commercial harvest of summer chum salmon. Ultimately, the sonar at Pilot Station estimated the passage of summer chum at approximately 2.7 million fish in 2013, well above the historical median of 1.9 million (JTC 2014:9). To reduce the incidental catch of Chinook salmon in the summer chum commercial fishery, commercial fishing was delayed until the estimated midpoint of Canadian-orgin Chinook salmon run had passed through the Lower Yukon Area. Additionally, managers implemented new regulations adopted by the BOF in 2013 that allowed the commercial harvest of summer chum salmon using dip nets and beach seines beginning on June 18 in District 1 and June 20 in District 2. Fishermen were required to immediately release incidentally caught Chinook salmon. Later in the season, 5½ -inch mesh gill nets were allowed on July 2 in the South Mouth part of District 1 where the majority of Chinook salmon had already migrated upriver; the rest of District 1 and District 2 did not transition to the use of gillnets until July 8 (JTC 2014:9). A new regulation adopted by the BOF in 2012 allowed ADF&G to open a commercial summer chum fishery in Subbdistrict 4-A using fish wheels that were attended at all times in order to immediately release Chinook salmon back to the water alive. In 2013, the BOF adopted regulations detailed construction specifications intended to reduce injuring Chinook salmon as they passed through the wheels (JTC 2014:10) A total of 928 Chinook salmon were reported caught in dip nets and beach seines in the lower river districts and released back to the water alive; a total of 100 Chinook salmon were reported caught and released back to the water alive in the fish wheel fishery in upper river districts. A total of 484 Chinook salmon were incidentally harvested and reported as caught but not sold during commercial chum salmon openings.[6]

The preseason outlook for fall chum salmon estimated a return of greater than 800,000 fish, enough to meet the escapement goal and provide for subsistence harvests, and support a commercial harvest.[7] In 2013, fall chum salmon returned to the river slowly through July, and daily sonar passages continued to

6. Alaska Department of Fish and Game Division of Commercial Fisheries. "2013 Preliminary Yukon River Summer Season Summary," news release, October 7, 2013. Accessed June 2015. http://www.adfg.alaska.gov/static/applications/dcfnewsrelease/369991357.pdf

7. Alaska Department of Fish and Game Division of Commercial Fisheries. "2013 Preliminary Yukon River Summer Season Summary," news release, October 7, 2013. Accessed June 2015. http://www.adfg.alaska.gov/static/applications/dcfnewsrelease/369991357.pdf

be below historical medians through mid-August. As a result, no commercial opentings were allowed to ensure the passage of fall chum into upper river districts for escapement and subsistence harvest. Beginning on August 14, a 2-day pulse delivered approximately 195,000 fish to the river followed by 2 more pulses for an estimated total sonar count of 717,000 fish by early September 2013. Commercial opportunities began in mid August and continued through September (JTC 2014:12). A directed commercial fall chum salmon fishery resulted in a harvest of 289,692 fall chum salmon, but coho salmon passage was below average for the entire season with an estimated sonar count of 85,000 fish. While coho salmon were harvested incidentally in directed fall chum commercial openings, no coho salmon directed commercial openings were prosecuted in 2013A total of 443 permit holders participated in the fall season salmon commercial fishery; 436 in districts 1 and 2 combined and 7 in districts 4, 5, and 6 combined. Participation in lower river districts during the 2013 fishing season was above historical averages while participation in the upper river districts was about the same.[8]

## SUBSISTENCE HARVEST ASSESSMENT METHODS

For the majority of villages within the Yukon Area, there are no regulatory requirements to report subsistence salmon harvests. For these villages, ADF&G utilizes a voluntary survey program to estimate the total subsistence salmon harvest. Harvest information is collected using a combination of subsistence harvest calendars mailed prior to fishing activities and postseason surveys conducted in person or by phone or letter. In road-accessible portions of the Yukon Area—including the majority of the Tanana River drainage (subdistricts 6A and 6B and the Upper Tanana River drainage), the Yukon River drainage between Hess Creek and the Dall River (known as the Yukon River Bridge Area), the upper portion of Subdistrict 5D between the upstream mouth of Twenty-two Mile Slough and the U.S.–Canada border, and, as of 2004, the Rampart Area (western end of Garnet Island to the mouth of Hess Creek), and the Middle and South Fork Area of the Koyukuk River—subsistence fishers are required to obtain an annual household permit prior to fishing, document their subsistence salmon harvests on the household permit, and return it to ADF&G at the end of the season.

Prior to salmon fishing activities, subsistence harvest calendars are mailed to all identified fishing households within the survey communities. The Lower Yukon Area calendars contain the months of May through September and the Upper Yukon Area calendars contain the months of June through October. Additional calendars are mailed to those households for which fishing activities are unknown and are also made available to households upon request from ADF&G offices in Emmonak and Fairbanks. The calendars provide space for fishers to record their daily subsistence harvests of salmon by species. Calendars are return-postage-paid and are mailed to ADF&G or given to ADF&G research staff during postseason trips to the villages, especially during the postseason salmon survey. Posters sent to village post offices and announcements on area radio stations remind fishers to give their calendars to research staff. In 2013, Division of Commercial Fisheries staff distributed calendars to all households identified as participating in some level of fishing or with unknown fishing harvests; households identified as nonfishing households did not receive calendars. A total of 1,760 calendars were sent to Yukon River households. Approximately 19% of calendar recipients (330) returned harvest calendars either by mail or through research staff during their fall surveys. Calendars provide additional Yukon Area run and harvest timing information that is not obtained by other data collection methods (Jallen et al. *In prep*).

In addition to the harvest calendars, ADF&G Division of Commercial Fisheries staff conduct postseason in-person interviews with a stratified random sample of all households in surveyed communities within the Yukon River drainage. Survey questions focus on Chinook, summer chum, fall chum, and coho salmon, but households are also asked about other species as well, such as pink salmon (primarily taken by coastal communities), northern pike *Esox lucius*, whitefishes, and sheefish. Some households that are

8. Alaska Department of Fish and Game Division of Commercial Fisheries. "2013 Yukon River Fall Season Summary," news release, November 27, 2013. Accessed June 2015. http://www.adfg.alaska.gov/static/applications/dcfnewsrelease/376437276.pdf

not contacted in person by the surveyors are contacted by telephone. Those households not contacted by telephone are mailed a survey questionnaire and a postage-paid return envelope.

A subsistence permit is required in the road-accessible portions of the Yukon River drainage. Subsistence fishers record their daily salmon harvests on a household permit and return the permit within 10 days of the expiration date on the permit. Subsistence permit applications are mailed to all who returned the prior year's permit, along with instructions on how to apply by mail. In addition, ADF&G staff travel to select villages so that applicants can be issued permits in person. Permits are also issued in several ADF&G offices or by mail throughout the season. Those who do not return permits are sent up to 2 reminder letters. Telephone contacts with households that do not respond to the reminder letters are attempted as a final measure.

Subsistence salmon permit holders in a portion of Subdistrict 6B (the Tanana River drainage above a point 3 miles upstream of Totchaket Slough to the boundary with Subdistrict 6C) and the personal use fishers in Subdistrict 6C are required to report their harvests weekly for inseason management purposes. To maximize the return of permits, ADF&G staff also sent reminder letters to these households. A total of 435 salmon fishing permits were issued to households in the Yukon Area in 2013, including 368 subsistence and 67 personal use permits (Table 4-4). Of these permits, 348 (95%) subsistence permits and 66 (99%) personal use permits were returned to ADF&G (Table 4-4) (Jallen et al. *In prep*). Unreturned permits were considered to be unfished, and subsistence fishing households are not eligible to receive a permit the following year until the previous year's permit is returned.

Department staff surveyed 1,193 households (out of a sample of 1,434 selected) in the Yukon Area concerning their subsistence salmon harvests (Table 4-5). Local surveyors also collected information from 41 households in Grayling as part of a pilot study to assess methods for local harvest documentation An additional 58 households mailed in their harvest numbers on a survey or a calendar (Jallen et al. *In prep*).

## SUBSISTENCE SALMON HARVESTS IN 2013

In 2013, 1,125 surveyed households (43% of the total households in surveyed communities)and 414 permit holders that returned permits provided harvest data for the Yukon Area subsistence–personal use salmon fishery (Table 4-4; Table 4-6). The estimated subsistence–personal use salmon harvest for the entire Yukon Area included 12,575 Chinook salmon (5% of the estimated total salmon harvest), 115,252 summer chum salmon (45%), 113,767 fall chum salmon (44%), 14,566 coho salmon (6%), and 1,079 pink salmon (<1%), for a total of 257,239 salmon (Table 4-6; Figure 4-2). Note that this is an estimated total based on household surveys and returned permits and calendars, and it includes subsistence harvests, personal use harvests, commercial harvests retained for subsistence, and fish distributed from ADF&G test fisheries.

Since the disastrous harvest levels in 2000 (152,300 total salmon), subsistence salmon harvests have fluctuated by species. Chinook salmon harvest levels have remained relatively stable except in years when conservative management actions were taken. As shown in Table 4-7, the 2013 Chinook salmon harvest estimates were below the most recent Yukon Area 5-year averages (2008–2012), likely reflecting the restrictions put in place to protect them. The estimated subsistence and personal use harvest of 12,575 Chinook salmon in 2013 was 68% below the most recent 5-year average of 39,104 fish, and 73% below the most recent 10-year average of 46,746 fish. Other explanations for decreases in Chinook harvest include voluntary reduction of harvest by Yukon River communities and individual households. Regardless, subsistence Chinook salmon harvests have not fallen within the amounts necessary for subsistence (ANS) range for the last 5 years. Households could also replace some of their Chinook harvest with other, more abundant, salmon species. For example, summer chum harvests stayed high after 2012 harvests and fall chum salmon harvests increased again in 2013 from 2010 to 2012 levels, possibly demonstrating species replacement strategies. Although the harvests of both summer and fall chum

salmon in 2013 were higher than their respective 5-year and 10-year averages, the harvests of Chinook salmon and coho and pink salmon all fell below their respective 5-year and 10-year averages.

Until 1996, when the market for chum salmon roe declined, subsistence harvests of summer chum salmon were regularly estimated between 115,000 and 142,000 fish. Fishers harvested summer chum salmon for roe and kept most of the carcasses primarily for dog food; these fish were counted in the subsistence harvest. Since then, summer chum harvests have been relatively stable. The estimated 2013 subsistence harvest of 115,252 summer chum salmon was 20% above the 5-year average of 95,993 fish and 22% above the 10-year average of 94,502 fish. Summer chum salmon may continue to play a larger role in subsistence salmon harvests if Chinook salmon harvests continue to decline as subsistence users attempt to adapt to changes in Chinook salmon availability.

Fall chum salmon harvests steadily declined in the late 1980s through the 1990s. Since then, harvest has fluctuated. Unlike summer chum, flucuations in harvest are less connected to the commercial market (Figure 4-3). Fall chum salmon are used as both human food and dog food, depending on quality and timing of harvests within the run. 2013 marks the second time in 6 years that the harvest of fall chum salmon fell within the ANS range (Table 4-8); declines in the maintenance of dog teams along the river likely account for this change in harvest levels. Historically, due to run timing, the management of coho salmon has been tied to the management of fall chum salmon. As such, it is difficult to assess actual trends in the harvest of coho salmon and reasons for these trends.

Pink salmon are on the calendar and survey for the entire survey area, but harvest is typically only reported in lower river communities. Although pink salmon can be abundant in lower Yukon River and coastal Yukon River delta communities, fishers do not typically harvest large numbers of this species.

Figure 4-4 shows the number of dogs reported by surveyed households in each fishing district, as well as the percentage of total dogs in the Yukon Area reported in each district. Of the estimated 1,774 households in the Yukon Area that own dogs, about 14% (244 households) fed whole salmon to their dogs in 2013 (Jallen et al. *In prep*). Most households that own dogs feed fish scraps, but do not harvest salmon to feed to dogs. Of the 5,007 dogs owned by Yukon Area households in 2013, upper Yukon households in districts 4, 5, and 6 owned 3,258 dogs (65% of the total number of dogs owned in Yukon River districts) (Figure 4-4). In 2013, the Division of Commercial Fisheries collected information on the number of each of the 5 species of salmon that fishers retained for dog food from subsistence harvests in surveyed communities. In permit communities, only the total number of whole salmon, and not the numbers of each species, was documented. In the Coastal District and in districts 1 through 5, an estimated 18,890 summer chum salmon, 51,427 fall chum salmon, and 191 coho salmon were retained for dog food from subsistence salmon harvests. Additionally, permit holders fed 24,873 whole salmon to dogs, including in District 6, which includes Manley Hot Springs, Minto, Fairbanks, Healy and other Upper Tanana villages (Jallen et al. *In prep*).

Primary gear types used by Yukon Area fishing households in 2013 included set gillnet (45%), drift gillnet (47%), and fish wheel (8%) (Figure 4-5), largely the same as 2009, 2010, and 2011.

Since 1992, ADF&G has asked surveyed households whether they were able to meet their subsistence salmon needs for each survey year. The disastrous fishing year in 2000 resulted in restrictions and closures in subsistence salmon fishing schedules and made it extremely difficult for fishing families to meet their needs (64% of surveyed households reported not meeting their needs in 2000) (Borba and Hamner 2001:98). In 2003, ADF&G began asking households to describe whether they met their subsistence needs for each species of salmon, measuring responses by community and by species. Specifically, surveyed households were asked whether 100%, 75%, 50%, or less than 25% of their harvest needs were met for each species. Two checkboxes, “0%” and “no need,” were added to the 2005 survey in order to distinguish those who had a need but no success in harvesting a species from those who had no need and therefore did not harvest any fish. Not all surveyed households supplied information about whether or not they met their needs for each species. The number of surveyed households responding to

the needs met question was greatest for Chinook salmon, and lowest for coho salmon (Chinook salmon, 769 households; summer chum salmon, 510 households; fall chum salmon, 353 households; coho salmon, 136 households). According to the data, there was a marked change in responses to the needs met question from 2011 and previous years. Only 16% of all households reported meeting greater than 75% of their needs for Chinook salmon (Jallen et al. *In prep*). This represents a continued decrease since 2005 in the percentage of households reporting that they met the majority of their needs for Chinook salmon. Households that cited reasons for their decreased harvest most often reported the poor Chinook salmon run, regulatory closures, lack of gear, and voluntary harvest cut-backs to conserve Chinook salmon (Jallen et al. *In prep*). In 2013, more than half (56%) of surveyed households reported meeting greater than 75% of their needs for summer chum salmon; nearly half of households reported meeting greater than 75% of their needs for fall salmon species; 50% and 49% of surveyed households reported meeting greater than 75% of their needs for fall chum and coho salmon, respectively. Eighty percent of households reported meeting less than one-half (<50%) of their needs for Chinook salmon; 35%, 47%, and 49% of households reported meeting less than one-half their needs for summer chum salmon, fall chum salmon, and coho salmon, respectively.

In 1993, the BOF made a positive C&T use finding for all salmon in the Yukon–Northern Area. The ANS determination was established at 348,000–503,000 salmon for all species combined (5 AAC 01.236). Under these guidelines, 1992 marked the last year when total subsistence salmon harvests fell within the combined ANS range. Since 1990, the overall total subsistence salmon harvest in the Yukon Area has declined by approximately 32% (Table 4-7). In 2001, the BOF made species-specific ANS determinations for each of 4 species of salmon harvested in the Yukon Area, including separate ANS determinations for summer chum salmon and fall chum salmon. In 2013, the BOF added an ANS for pink salmon, 2,100–9,700. The ANS range provides one index of the extent to which reasonable opportunity is provided in each subsistence fishery. Harvests below the lower bound of the ANS range may indicate, with other evidence, that there was not a reasonable opportunity for subsistence harvests during the previous season. Harvests consistently below the lower bound of the ANS are an indication to the BOF to consider whether additional management actions are necessary to provide reasonable subsistence opportunities or if harvest and use patterns for a species have changed over time such that harvests fall outside of ANS ranges. With the exception of Chinook salmon, harvests of all salmon species in 2013 fell within their respective ANS ranges (Table 4-8). This was the sixth consecutive year that Chinook salmon harvests remained below the minimum bound of the ANS range; however, 2013 was only the second year since 2007 that both summer and fall chum salmon harvests fell within their respective ANS ranges (Table 4-8). See Table 4-8 for a comparison of ANS ranges and subsistence salmon harvests from 1998–2013.

## NONSALMON FISH HARVESTS

Although salmon harvests dominate most of the regulatory actions in the Yukon Area, nonsalmon fish harvests remain significant components of the seasonal subsistence round for Yukon Area fishers. Salmon are only available seasonally, but most nonsalmon species are available year-round. Nonsalmon fishes not only provide an important source of nutrition for residents of the Yukon Area, they also represent a significant cultural resource for subsistence fishers in the region. In 1987, and again in 1993, the BOF made a positive C&T use determination for freshwater fish species in the Yukon Area, including sheefish, whitefish species, Arctic lamprey, burbot, longnose sucker, Arctic grayling, northern pike, and Arctic char (5 AAC 01.236). Subsistence fishing for nonsalmon species is generally open by regulation 7 days per week, 24 hours per day, year-round. These state regulations also apply to subsistence fisheries in waters adjacent to federal lands in the project study area (unless superseded on federal public lands by federal subsistence regulations, applicable only to federally qualified subsistence users). Under ANILCA, rural Alaskan residents of the Yukon–Northern Area (except those living in ADF&G Game Management Unit 26B) and residents of the Yukon River drainage have a C&T use determination for nonsalmon fishes, and are qualified to participate in subsistence activities on federal public lands, even if other uses

and/or users have been prohibited from subsistence fishing in federal waters due to conservation concerns or user conflicts.[9]

ADF&G Division of Commercial Fisheries collects nonsalmon harvest data on an annual basis as part of a postseason salmon survey; however, collection of nonsalmon harvest data is not the primary purpose of the postseason subsistence salmon harvest survey. Furthermore, the implementation of this survey immediately following the salmon fishing season may not be timed to produce the most accurate results for nonsalmon harvests, nor is the stratified sample of salmon fishing households necessarily the best design for collecting nonsalmon harvest information. However, while other single-year harvest data collection efforts suggest that the postseason survey may significantly underestimate harvests (Andersen et al. 2004; Brown et al. 2005), these data have value as the only annual estimate of nonsalmon fish harvests in the Yukon Area (Table 4-9).

Table 4-9 estimates harvests of whitefish, sheefish, and northern pike by community. In 2013 Yukon area fishers from districts 1–5 harvested a total of 91,583 of these nonsalmon fish. This represents an increase since 2010 and 2011 when the total harvest of these species was 76,967 and 74,571 fish, respectively but an approximately 14% decrease of 2012 harvests (106,030 fish) (Jallen et al. *In prep*, 2012:111). The "large whitefish" category includes broad and humpback whitefishes while the "small whitefish" category includes least and Bering cisco species and round whitefish. Fishers in District 1 harvested the most number of whitefishes (18,371), followed by District 5 (14,236). On a drainagewide level, large whitefish species were harvested in greater numbers than any other nonsalmon fish. Approximately 36,333 large whitefishes, or 40% of the total nonsalmon harvest, were harvested by Yukon River fishers from districts 1–5—a slight decrease from the harvest in 2012; fishers in District 2, 4, and 5, harvested the greatest numbers of large whitefishes—between 7,932 and 9,647 fish—while fishers in District 1 harvested the largest number of small whitefishes (13,363). It is important to note that these totals do not include large whitefish harvests from District 6 along the Tanana River; data there are not reported by large and small categories. Fishers from districts 1–5 reported harvesting 11,264 northern pike and 15,553 sheefish in 2012. Districts 1, 2, and 4 households all harvested approximately the same numbers of northern pike (~2,400). District 1 households harvested more sheefish than in any other district (7,098). Permit fishers, primarily along the Tanana River and a few other locations along the Yukon River reported an additional harvest of 2,766 whitefish, 403 northern pike, and 48 sheefish (Jallen et al. *In prep*).

The Division of Subsistence has conducted numerous subsistence surveys along the Yukon River over time. Since 2008 for example, comprehensive surveys that included questions on nonsalmon species have been administered in Emmonak (Fall, Brown, et al. 2012); Galena, Nulato, Ruby, Marshall, Mountain Village[10]; Anvik, Grayling, Russian Mission (Ikuta et al. 2014); Shageluk, Pilot Station[11], Minto and Manley Hot Springs (Brown et al. 2014); and Tanana, Stevens Village, and Rampart.[12] Additionally, studies on the traditional ecological knowledge of nonsalmon have been conducted in the middle Yukon River communities of Tanana, Ruby, Galena, Nulato and Kaltag, and the Yukon Flat communities of Beaver, Birch Creek Village, Central, Circle, and Fort Yukon (Brown et al. 2010; Koskey and Mull 2011). A 2005 study explored the contemporary use of nonsalmon in the lower middle Yukon River communities of Grayling, Anvik, Shageluk and Holy Cross (Brown et al. 2005). Information on historical and contemporary harvest and use of nonsalmon in communities along the Yukon River, where data are

## THE ROLE OF SALMON WITHIN ANNUAL SUBSISTENCE HARVESTS

Considering salmon within the context of total subsistence harvests provides a true measure of the importance of the resource and the extent to which declines in Chinook salmon specifically affect rural communities. In addition to post-season salmon surveys conducted by ADF&G, Division of Commercial Fisheries staff, Division of Subsistence staff conducted comprehensive subsistence surveys in the community of Galena in District 4 of the Yukon River. In 2010, fish was among the most widely used category of wild foods used by Galena households: 79% of Galena households used 63,651 edible pounds of fish (Brown et al. in prep). Salmon accounted for 47% of Galena's total subsistence harvest by weight and 79% of the total fish harvest in 2010. Chinook salmon accounted for 25% of all fish resources harvested for subsistence and 15% of the total subsistence harvest in Galena. Chinook salmon were already in decline by 2010. In an earlier baseline comprehensive study, Galena residents harvested an estimated 3,057 Chinook salmon in 1985 (Marcotte 1990) compared to an estimated 1,689 Chinook salmon in 2010. The 1985 Chinook salmon estimate accounted for approximately 8% of the total harvest and 10% of the total fish harvest. These lower percentages are likely due to the extremely high numbers of summer chum harvested by Galena residents for the commercial roe fishery where carcasses were used primarily for dog food to support large dog teams and was counted in the subsistence fishery. For comparison, Galena residents harvested 15,322 lb of summer chum salmon in 2010 compared to 274,260 lb in 1985. After the disappearance of the roe fishery by 1990, summer chum harvests by Galena residents have remained stable around 2,000–3,000 fish. Aside from salmon species, the resource harvested in the next largest amounts was moose in 1985, which accounted for 17% of the total subsistence harvest; with fewer salmon being harvested in 2010, moose harvests accounted for 34% of the total harvest. A poor king salmon run and conservative management strategies in 2013 resulted in even lower harvests of king salmon throughout the drainage than in 2010, and according to ADF&G's post-season salmon survey, Galena housheolds harvested 275 king salmon (Jallen et al. *In prep*), a 91% decline from 1985 and a 84% decline from 2010.

*Note*: Shaded areas indicate fishery closures; outlined shaded days were closed to protect the first and second pulses of Chinook salmon. **Bold font indicates openings for commerical fishing periods**. Dates with double lines above and below contain subsistence openings limited to beach seines and dip nets with no retention of Chinook salmon allowed. Dates with dark shading were closed for subsistence fishing for 12 hours before, during and 12 hours after commercial fishing periods. Unless noted, mesh size was restricted to 7.5-inch or less in all districts and subdistricts in 2013. The Innoko River remained open 24 hours a day 7 days a week, but was restricted to 6-inch or smaller mesh from 8pm June 5 to July 14. During subsistence salmon fishing closures, all gillnets with a mesh size greater than four inches and a length greater than 60 feet must be removed from the water.

a. The Coastal District was split for management purposes based on which mouths various salmon species were entering the delta.
b. The portion of the Coastal District from the Naskonat Peninsula north to 62 degrees North latitude and three miles offshore, including communities of Chevak, Hooper Bay, and Scammon Bay.
c. The portion of the Coastal District from 62 degrees North latitude to Point Romanof and 3 miles offshore.
d. Commercial period open during all or part of a subsistence fishing period.
e. Commercial salmon fishing with beach seine and dip net gear only. Beach seine mesh size is restricted to 4-inch or smaller mesh size. Dip net mesh size is restricted 4.5-inch or smaller mesh. Fishermen employing dip nets or beach seine gear were required to immediately release incidentally caught Chinook salmon back to the water alive. Chinook salmon killed by these gear types were required to be recorded on a fish ticket and forfeited to the state. Commercial permit holder may operate up to four dip nets, while subsitence fishermen may only operate one dip net per person.
f. Subsistence fishing opened concurrently with a commercial dip net/beach seine period during all or part of a subsistence closure and restricted to beach seine and dip net gear only. Fishermen were required to release Chinook salmon alive.
g. Subsistence fishing period restricted to 6 inch or smaller mesh with retention of Chinook salmon allowed occuring during all or part of a commercial and subsistence period restricted to beach seines and dip nets where all Chinook salmon must be immediately released alive.
h. Commercial fishing limited to beach seine and dip net. Subsistence fishing with these gear types not allowed during this opening.
i. Commercial salmon fishing in the South Mouth area of District 1 open for a 6-hour commercial fishing period with gillnets restricted to 5 ½-inch or smaller mesh size and not exceeding 30 meshes in depth to target summer chum salmon. The area open to commercial fishing extends from the lower point of Head of Passes to Chris Point and includes Black River, Kwiguk Pass, and coastal waters from the Black River to one mile north of Kwiguk Pass. Middle and North Mouth and passes such as Aproka and Bugomowik, north of the mainstem South Mouth are closed to commercial fishing.
j. Effective 12:00 noon commercial fishing not allowed on the south bank of the Yukon River from an ADF&G buoy upstream of the Pilot Station Sonar to an ADF&G marker 500 yards downstream of the sonar.
k. Commerical fishing open to 6" or smaller mesh. Chinook salmon may be retained for subsistence.
l. Commercial fishing open in the entire District 1 with gillnets restricted to 5.5" or smaller mesh and not exceeding 30 meshes in depth. Chinook salmon may be retained for subsistence purposes.
m. Commercial fishing open in the entire District 1 area for 6-inch or smaller mesh. Commercial gillnet fishemen may retain Chinook salmon for subsistence purposes.
n. Coastal District reopened to 7.5" or smaller mesh by Emergency Order. Not announced in News Releases until July 14th.
o. Commerical fishing open between these hours in either or both the Coastal Set Net only area of District 1 and the remainder of District 1. Typically the remaineder of District 1 was open 3 hours after the start of commercial fishing periods in the Coastal Set Net Only Area. Chinook salmon may be retained for subsistence purposes, but not sold. Gear restricted to gillnets of 6" or smaller mesh.
p. Remained open 24 hours a day seven days a week.

*Note*: Shaded areas indicate windowed fishery closures; outlined shaded days were closed to protect the first and second pulses of Chinook salmon. Unless noted, mesh size was restricted to 7.5 inch or less in all districts and subdistricts.

a. Subdistrict 4-A was divided into two separate areas above and below Stink Creek to protect the first pulse of Chinook salmon as it passed through this long section of river.

b. State regulations do not allow the use of drift gillnets in State waters of Subdistrict 4-B and 4-C. Federal regulations allow the use of drift gillnets in Federal waters of Subdistricts 4-B and 4-C.

c. Subdistrict 5-D was divided into three separate areas to protect the first pulse of Chinook salmon as it passed through this long section of river. Subdistrict 5-D Lower: from the ADF&G marker two miles downstream of Waldron Creek upstream to the Hadweenzic River, Subdistrict 5-D Middle: from the Hadweenzic River upstream to 22 Mile Slough, Subdistrict 5-D Upper: from 22 Mile Slough to the US/Canada border.

d. By regulation, fishermen in Subdistrict 4A may use drift gillnets during scheduled subsistence salmon fishing periods on the mainstem of the Yukon River from June 10 to July 14. This period was extended until 6pm Monday, July 15.

e. Commercial fishing period in Subdistrict 4A with fish wheels only. Fish wheels were required to be manned at all times, and any Chinook salmon caught were to be immediately released alive. From July 1 to July 20, commercial fishing was open for twenty 24-hour periods. As per construction specifications adopted by the Board of Fisheries, fish wheels must be constructed in a manner that reduces the potential for injury to Chinook salmon.

f. Subsistence fishing open for gillnets restricted to 6-inch or smaller mesh. Fish wheels must be equipped with a chute or live box, closely attended while in operation, and all Chinook salmon released back to the water alive.

g. Gear restrictions discontinued in this period and subsequent periods. Subsistence fishing allowed with gillnets 7.5 inches or less, and Chinook salmon may be kept when caught in fish wheels.

h. Beginning 12:01 a.m. Saturday, August 3, the use of subsistence drift gillnet gear was allowed during subsistence salmon fishing periods in the portion of Subdistrict 4-A upstream from the mouth of Stink Creek. Fishermen could use gillnets with a mesh size of 7.5 inches or less.

i. Commercial fishing open in Subdistricts 5-B and 5-C concurrent with subsistence fishing periods. Chinook salmon may not be sold but may be used for subsistence.

*Note*: Shaded areas indicate windowed fishery closures; outlined shaded days were closed to protect the first and second pulses of Chinook salmon. Unless noted, mesh size was restricted to 7.5 inch or less in all districts and subdistricts.

a. The regulatory schedule is always in place in the Tanana River District and does not have a start date.

b. Commercial fishing open concurrent with subsistence and restricted to fish wheels only. Fish wheels were required to be constructed in a manner that reduces the potential for injury to Chinook salmon, manned at all times, and any Chinook salmon caught were to be immediately released alive.

c. Commercial fishing open during subsistence or personal use fishery closure and restricted to fish wheels. Fish wheels were required to be constructed in a manner that reduces the potential for injury to Chinook salmon, manned at all times and any Chinook salmon caught were to be immediately released alive.

d. Commercial fishing open concurrent with subsistence fishing. Commercial fishermen restricted to fish wheels or 6-inch or smaller mesh

e. Commercial fishing open during a personal use fishery closure and restricted to fish wheels or set gillnets with 6-inch or smaller mesh.

f. Commercial fishing opening concurrent with subsistence and personal use fishery openings. No additional gear restrictions. Some commerical periods had no harvest or fishermen participating.

g. Commerical fishing open continuously for 76 hours and during a subsistence fishing closure.

Table 4-4.–Household subsistence and personal use permits, listed by fishery and community of residence, Yukon Area, 2013.

| Community | Permits | | Percent returned | Number of permits returned that fished |

a. Fairbanks North Star Borough (FNSB) residents from the communities of Ester, Fairbanks, North Pole, Salcha, and Two Rivers.
b. Upper Tanana River (UTV) residents from the communities of Delta Junction, Dot Lake, Northway, Tanacross, and Tok.
c. Includes residents from Anchorage, Anderson, Copper Center, Denali Park, Eagle River, Palmer, Tanana, Wasilla, and Wiseman who were issued a subsistence fishing permit for the Yukon, Tanana, Tolovana, Kantishna, and Upper Koyukuk Rivers.
d. Includes residents of Nenana and Delta Junction that applied for a personal use permit.

a. Estimates for 1998-2004 do not include personal use harvests, ADF&G test fishery distributions, or salmon removed from commercial harvests. Estimates for 2005–2013 include test fishery distributions because the amounts necessary for subsistence (ANS) are based on harvests from 1990–1999 and included test fishery distribution. **Bold underlined** cells indicate harvest amounts are below the minimum ANS.

b. ANS for pink salmon added by BOF in 2013.

c. Species-specific ANS ranges do not apply before 2001.

# CHAPTER 5: KUSKOKWIM AREA

## BACKGROUND

The subsistence salmon fisheries in the Kuskokwim Area are some of the largest in the state of Alaska, in terms of the number of residents who participate and the number of salmon harvested (Fall et al. 2014). Since 1994, when the Alaska Department of Fish and Game (ADF&G) began acquiring reasonably complete statewide coverage of subsistence harvest survey data, over 50% of Chinook salmon harvested under subsistence regulations have been taken in the Kuskokwim Area, mostly in the Kuskokwim River drainage. Between 2010 and 2014 (study years 2009–2013), the Division of Subsistence conducted comprehensive subsistence harvest and use surveys in 23 Kuskokwim Management Area communities. The results indicate that, on average, salmon contribute 42% of the total wild resource harvest (in edible pounds) in the Lower Kuskokwim communities, 65% in the Central Kuskokwim communities, and 25% in the Upper Kuskokwim communities (Brown et al. 2012, 2013; Ikuta et al. 2014).[1] Residents of the Kuskokwim Area harvest 5 species of Pacific salmon for subsistence purposes: Chinook salmon *Oncorhynchus tshawytscha*, chum salmon *O. keta*, coho salmon *O. kisutch*, pink salmon *O. gorbuscha*, and sockeye salmon *O. nerka*. Drift gillnetting, set gillnetting, and hook and line fishing are the primary methods used when harvesting salmon, although additional gear types are allowed as specified in 5 AAC 01.270. Kuskokwim Area communities are heavily reliant upon the annual returns of salmon not only for basic nutrition, but also for maintenance of cultural identity and cultural values, in addition to economic opportunities for commercial sales (Andrews and Coffing 1986; Andrews 1989:154; Barker 1993; Brown et al. 2012, 2013; Coffing 1991; Fienup-Riordan 1990:184, 1995:120, 123; Himmelheber 1987:32; Ikuta et al. 2013, 2014; Oswalt 1963a–b, 1990; Pete 1993; Senecal-Albrecht 1998, 1990; Walker and Coffing 1993; Wolfe et al. 1984).

ADF&G has been estimating Kuskokwim Area subsistence salmon harvests annually by postseason subsistence harvest survey since 1960. Simon et al. (2007) discussed the history of annual harvest monitoring methods used by the Division of Commercial Fisheries from 1960–1987 as well as the different methods used from 1988–2007 by the Division of Subsistence (see also Walker and Coffing 1993). Beginning in 2008, the Division of Commercial Fisheries once again assumed responsibility for the annual postseason subsistence salmon harvest monitoring program using methods outlined in Carroll and Hamazaki (2012a). In the Kuskokwim Area, there are 38 communities, 28 of which are surveyed each year on a voluntary basis. As Table 5-1 shows, in 2013, there were approximately 4,314 households in 32 communities, excluding the 6 Bering Sea communities.[2] Bethel is the largest community in the region, consisting of approximately 2,126 households in 2013. The north Kuskokwim Bay communities of Kwigillingok, Kongiganak, and Kipnuk are not located on the Kuskokwim River, but many subsistence salmon fishing households from these communities have traveled to the Kuskokwim River to fish, but may have also harvested salmon from coastal areas and local tributaries (Himmelheber 1987:7; Stickney 1984:60–61; Walker and Coffing 1993:1). Except in 2000 and 2004, only the community of Kongiganak (Carroll and Hamazaki 2012a) has participated in the voluntary ADF&G harvest survey. The communities of Quinhagak, Goodnews Bay, and Platinum, located in south Kuskokwim Bay, comprise 7% of the total Kuskokwim Area households (Carroll and Hamazaki 2012b) and harvest salmon primarily from the drainages of the Kanektok, Arolik, and Goodnews rivers (Walker and Coffing 1993:1; Wolfe et al. 1984:321–322). Subsistence users from Bering Sea coastal communities have chosen to not participate

1. See also Ikuta, Hiroko and David S. Koster. *In prep*. Bethel Subsistence, 2012: Wild Resource Harvests and Uses, Land Use Patterns, and Subsistence Economy in the Hub Community of the Yukon–Kuskokwim Delta. Fairbanks: Alaska Department of Fish and Game, Division of Subsistence Technical Paper No. NNN. Hereafter referred to as (Ikuta et al. *In prep*).
2. Household number estimates are not available for the coastal communities. Subsistence users from these communities harvest salmon in coastal waters as well as in area rivers. Relatively little documentation exists of subsistence salmon harvests of Bering Sea coastal communities because the communities are not included in either the Kuskokwim or the Yukon postseason subsistence salmon harvest monitoring programs (Wolfe et al. 2012).

in the ADF&G study for most years. These include the communities of Mekoryuk (on Nunivak Island), Newtok, Tununak, Toksook Bay, Nightmute, and Chefornak (Carroll and Hamazaki 2012a–b). While little information is available, residents of Bering Sea coastal communities harvest salmon from local rivers and coastal waters, which likely include coastal stocks as well as mixed stocks that were not bound for the Kuskokwim River (Fienup-Riordan 1983:112; Walker and Coffing 1993:1). In 2011, sponsored by the Arctic-Yukon-Kuskokwim Sustainable Salmon Initiative, the Association of Village Council Presidents (AVCP) collected subsistence salmon harvest data in 7 coastal communities: Chefornak, Kipnuk, Mekoryuk, Newtok, Nightmute, Toksook Bay, and Tununak (Kwigillingok chose not to participate in the AVCP project) (Wolfe et al. 2012). This project provided the only reliable subsistence salmon harvest data in recent years for this portion of the Kuskokwim Area (Table 5-2), and in 2013, these data were considered by the Alaska Board of Fisheries as they revised the amount reasonably necessary (ANS) for subsistence uses of salmon in the remainder of the Kuskokwim Area.

## REGULATIONS

Statewide eligibility criteria require individuals to be Alaska residents for the preceding 12 months before harvesting salmon for subsistence uses. Most subsistence salmon fishers in the region are Kuskokwim Area residents; however, some subsistence fishers are domiciled in other parts of Alaska and return to fish alone, or to assist family or friends with the harvesting or processing of salmon (Simon, Krauthoefer, Koster, and Caylor 2007:5).

Prior to 1990, there were additional restrictions on participation in the subsistence fishery related to the state's rural priority for subsistence, which subsequently was determined by the Alaska Supreme Court to be unconstitutional. In 1988, the State of Alaska Board of Fisheries formed the Kuskokwim River Salmon Management Working Group (KRSMWG) in response to requests from stakeholders in the Kuskokwim Area who sought a more active role in the management of salmon fishery resources (Bailey and Shelden 2014:1; Smith and Linderman Jr. 2008:1). The KRSMWG is composed of knowledgeable stakeholders, processors, and sport fishery representatives, as well as ADF&G biologists and social scientists. It acts in a representative fashion for communities throughout the Kuskokwim River drainage.

As a result of the passage of Alaska National Interest Lands Conservation Act (ANILCA) and in light of a 1989 Alaska Supreme Court decision, the federal government established the federal subsistence program, which provides subsistence opportunity for qualified rural residents on applicable federal public lands and in applicable federal public waters. Federal subsistence schedules, openings, closings, and fishing methods in the Kuskokwim Area are generally the same as those for state subsistence salmon fisheries, unless superseded by federal special action (50 CFR § 100.27). Regulatory authority for Kuskokwim River salmon management is shared by the Federal Subsistence Board (FSB) and the BOF. On the Kuskokwim, ADF&G is responsible for implementing the Kuskokwim River Salmon Management Plan (5 AAC 07.365) and also has inseason discretionary management authority of salmon in Alaska navigable waters. Waters of the lower Kuskokwim River are largely within or adjacent to federal public lands, namely the Yukon Delta National Wildlife Refuge. As such, the U.S. Fish and Wildlife Service (USFWS) shares inseason subsistence fishing management decision-making with ADF&G. USFWS holds final decision-making authority over management of salmon in these waters only in the event that the federal subsistence program determines that subsistence uses by non-federally qualified users must be eliminated in order to meet the federal subsistence priority. The KRSMWG advises state and federal managers through an established process and is currently the primary forum through which management decisions are made regarding Kuskokwim River subsistence, commercial, and sport salmon fisheries (Smith and Linderman Jr. 2008:1). The highest priority in state and federal management of the Kuskokwim River's salmon populations is biological sustainability of the resources based on principles of sustained yield. In the event that returning salmon numbers are not sufficient to meet established escapement goals that will allow for the maintenance of future generations of salmon populations, consumptive uses of salmon may be restricted. Under conditions when there is a harvestable

surplus beyond these minimum escapement levels, consumptive uses of salmon are prioritized for different user groups. Individuals must be Kuskokwim Area residents to participate in the Kuskokwim federal subsistence salmon fishery (50 CFR § 100.5)

Alaska Statute 16.05.258, "Subsistence use and allocation of fish and game," establishes the subsistence use priority (above sport, commercial, and personal uses) when resources are not abundant enough to provide for all consumptive uses, while remaining in accordance with principles of sustained yield. Subsistence uses protected by the subsistence priority are those practices identified as customary and traditional practices, as determined by the BOF. In 1993, the BOF made positive findings for customary and traditional uses of all salmon species in the entire Kuskokwim Area.[3] As part of these findings, the BOF then determined the amount reasonably necessary for subsistence (ANS) in these respective areas as one means to provide reasonable opportunities for subsistence uses. Based on historical harvest information, an ANS of 192,000–242,000 for salmon of all species in the Kuskokwim Area was determined (5 AAC 01.286). In 2001, the BOF amended these ANS ranges for Kuskokwim River using subsistence harvest data from the years 1990 to 1999. After reviewing various options, the BOF made new customary and traditional use and ANS findings for the Kuskokwim area by species.

In January 2013, the BOF again modified ANS ranges by species for each river system. The current ANS ranges for salmon in the Kuskokwim Management Area are as follows (5 AAC 01.286(b)):

| | |
|---|---|
| 67,200–109,800 | king [Chinook] salmon in the Kuskokwim River drainage; |
| 41,200–116,400 | chum salmon in the Kuskokwim River drainage; |
| 32,200–58,700 | sockeye salmon in the Kuskokwim River drainage; |
| 27,400–57,600 | coho salmon in the Kuskokwim River drainage; |
| 500–2,000 | pink salmon in the Kuskokwim River drainage; |
| 6,900–17,000 | salmon in Districts 4 and 5 combined; and |
| 12,500–14,400 | salmon in the reminder of the Kuskokwim Area |

The BOF in 2013 also updated and clarified the Kuskokwim River Salmon Rebuilding Management Plan (5 AAC 07.365). The new plan provides guidelines for managing the Kuskokwim River salmon fisheries to meet escapement goals and the subsistence priority. During times when the amount of fish available for subsistence harvest is limited, the commissioner may open a fishing period during which king salmon may only be taken by persons 60 years of age or older. Persons 60 years of age or older can only be assisted by family members within the second degree of kindred. The persons 60 years of age or older must be present while fishing, and proxies are not allowed.

Subsistence harvest of Pacific salmon species in the Kuskokwim River is allowed without a permit (5 AAC 01.280) and with generally no closed seasons (5 AAC 01.260), except as specified in the management plan or otherwise ordered for conservation purposes. Alaska regulations allow a variety of gear types to be used in the Kuskokwim River for subsistence salmon fishing and include specifications regarding the use of gillnets (5 AAC 01.270). There are no federal or state bag or possession limits for subsistence salmon harvests in the Kuskokwim River, except from June 1 through August 31, when subsistence fishing with a hook and line attached to a rod or pole, in that portion of the Aniak River drainage upstream of Doestock Creek, the bag and possession limit is 2 Chinook salmon, and rainbow trout, *O. mykiss*, may not be retained (5 AAC 01.295). Federal regulations of all subsistence fish harvests in Alaska federal public lands and waterways are administered under 50 CFR §100.27, including seasons, gear types, and bag and possession limits on all salmon and nonsalmon species.

3. The Kuskokwim Area includes the Kuskokwim River drainage, all waters of Alaska that flow into the Bering Sea between Cape Newenham and the Naskonat Peninsula, and Nunivak and St. Matthew islands. 38 communities are located within this area.

By regulation, therefore, the subsistence salmon fishing season in the Kuskokwim Area is generally open unless a subsistence fishing schedule closure is implemented. If closures to the fishery are necessary, they are implemented by emergency order prior to, during, and after commercial fishing periods, or closures to the fishery are implemented by emergency order for conservation purposes (see 5 AAC 01.260, and 5 AAC 07.365). On the Kuskokwim River, a subsistence fishing schedule with periodic fishing closures (openings between these closures were often referred to as "windows" or "openers") was implemented from 2001–2006 and has since been discontinued.

### Subsistence Fishery

In January 2013, the BOF adopted a new Kuskokwim River Salmon Management Plan (5 AAC 07.365) and established a new drainage wide sustainable escapement goal (SEG) of 65,000–120,000 Chinook salmon. The 2013 Kuskokwim River Chinook salmon forecast was for 160,000–240,000 fish. The historical average subsistence Chinook salmon harvest between 1990 and 2011 is approximately 84,000 fish. The 2013 Chinook salmon forecast indicated that there would be enough fish to meet escapement goals and provide for average subsistence harvest (Chavez and Shelden 2014).[4]

Preseason management actions included a closure on subsistence Chinook salmon fishing with hook and line gear, and a restriction on gillnet use to a mesh size of 4 inches or less and net length no greater than 60 feet in lower river tributaries. Restrictions were implemented in the mainstem Kuskokwim River beginning on June 28 from the mouth of the Kuskokwim River to the village of Tuluksak, and July 3 from Tuluksak to the village of Chuathbaluk. In each conservation section, gillnets were restricted to 6-inch or less mesh size, and hook and line fishing for Chinook salmon was closed. Each section was subject to 12 days of restriction in an attempt to allow sufficient numbers of Chinook salmon to reach spawning grounds. All actions were recommended by state and federal managers and supported by the Working Group. Except for closures around commercial fishing periods, subsistence salmon fishing was open with unrestricted gillnet mesh size and all other legal gear types from July 15 through the remainder of the salmon fishing season. During the inseason subsistence harvest monitoring project in 2013, the majority of families considered the Chinook salmon catch to be "very good." Assessment of chum and sockeye salmon catchers were mostly considered "normal" to "very good." A small minority reported it as "poor" (Chavez and Shelden 2014:7). The report about the results of 2013 postseason subsistence harvest survey is currently unavailable.

In 2013, subsistence Chinook salmon harvests (51,211) were approximately 50% higher than the 2012 harvest (25,706) (Table 5-3). However, due to low abundance and restrictions, subsistence Chinook salmon harvests did not meet the lower range of ANS (67,200) in 2011–2013. In addition, in the 2013 season, Chinook salmon escapements at tributary weirs were the lowest on record at all projects, and the Kuskokwim River drainagewide sustainable escapement goal (SEG) was not achieved (Personal communications, Travis Elison, Kuskokwim Area Biologist, December 2, 2013 and January 8, 2014). Although the minimum bound of the current escapement goal range set by BOF is 65,000 Chinook salmon spawning throughout the entire Kuskokwim drainage, possibly less than 30,000 Chinook salmon reached the spawning grounds of Alaska's second largest river system.

## SUBSISTENCE SALMON HARVEST ASSESSMENT METHODS

ADF&G has been estimating Kuskokwim Area subsistence salmon harvests annually by postseason subsistence harvest survey since 1960: by the Division of Commercial Fisheries in 1960–1987, by the Division of Subsistence in 1988–2007, and by the Division of Commercial Fisheries since 2008 (Carroll and Hamazaki 2012a–b). The purpose of the survey is to collect data about the number and species of salmon harvested by area residents.

4. Alaska Department of Fish and Game Division of Commercial Fisheries. "2013 Preliminary Kuskokwim Area Salmon Season Summary Kuskokwim Area Management," news release, October 9, 2013. http://www.adfg.alaska.gov/static/applications/dcfnewsrelease/370446131.pdf

For data collection in 2013, under a cooperative program between ADF&G and the USFWS Office of Subsistence Management, subsistence salmon harvest data collection in Bethel was conducted by staff from the Orutsararmiut Native Council (ONC), which has been involved in subsistence salmon harvest monitoring in Bethel since 1999. Subsistence harvest data collection in Aniak was conducted under a similar agreement by staff from the Kuskokwim Native Association (KNA), which has been involved in subsistence salmon harvest monitoring in Aniak since 2002 (Simon, Krauthoefer, Koster, and Caylor 2007).

The data from the postseason subsistence harvest survey are analyzed to provide an estimate of the number of salmon harvested for subsistence purposes. This information has been used by ADF&G, the U.S. Fish and Wildlife Service (USFWS), the BOF, and the FSB to manage customary and traditional (C&T) uses of salmon and to provide reasonable opportunities for continued customary and traditional uses of salmon throughout the area. More detailed descriptions of subsistence salmon harvest monitoring methods utilized in the Kuskokwim Area are found elsewhere (Hamazaki 2011; Simon, Krauthoefer, Koster, and Caylor 2007; Shelden et al. 2014; Walker and Coffing 1993).

## Household Harvest Surveys

### *Study Design*

The postseason subsistence harvest survey for the majority of communities was designed based on a stratified random survey methodology (Scheaffer 1990). From 1989 to 2010, each household was classified into three strata based on the household's recent 2-year history of participation in the subsistence fishery. Beginning in 2005, surveys collected harvest data for pink salmon. In 2011, the above household classification was expanded into 5 strata based on a household's most recent 2 known years of participation within the past 5 years in the subsistence fishery.

An attempt was made to census the 2 highest harvest strata groups, and the strata group for which no past harvest level could be determined. The remaining 2 strata groups of light and non-harvesters were sampled at 30% each. A full description of methods used for harvest level classification and sampling are available in Shelden et al. (2014:4-12).

The data were entered into the subsistence harvest database maintained by the Division of Commercial Fisheries. The data were subsequently extracted and processed by Commercial Fisheries staff. The analyzed data were transmitted to Division of Subsistence analysts for final formatting and inclusion in the Alaska Subsistence Fishery Database, maintained by the Division of Subsistence. All subsistence harvest data were treated as confidential, such that individual harvest data are not shared, and all analysis is aggregated and anonymous. The study was generally conducted in accordance with the *Alaska Federation of Natives Guidelines for Research*.[5]

### *Estimating Bethel Salmon Harvests*

In Bethel, the Division of Commercial Fisheries was responsible for designing and producing the survey instrument and selection of survey households, and ONC was responsible for conducting household surveys. Due to the impracticality of maintaining an accurate household list in order to stratify Bethel, a 25% random survey was conducted based on a simple random survey methodology where each dwelling (physical location instead of household) was the primary sampling unit. Before the harvest survey, ADF&G oriented ONC technicians to the project and instructed them in the proper implementation of the survey. ONC technicians conducted surveys in Bethel from October through November. Survey data were entered and analyzed by Division of Commercial Fisheries staff to generate subsistence salmon harvest estimates by species.

5. Alaska Federation of Natives. 2013. "Alaska Federation of Natives Guidelines for Research." Alaska Native Knowledge Network. Accessed May 14, 2014. http://www.ankn.uaf.edu/IKS/afnguide.html.

### *Estimating Aniak Salmon Harvests*

Like Bethel, Aniak is too large to effectively maintain a reliable household list, but due to its smaller size than Bethel, an attempted census is required to obtain the level of reliability of the estimate desired for this project.

The ADF&G Division of Commercial Fisheries was responsible for designing and producing the survey instrument and selection of survey households, and KNA was responsible for conducting household surveys in Aniak. Before the harvest survey, ADF&G oriented KNA technicians to the project and instructed them in the proper implementation of the survey. KNA technicians conducted surveys in Aniak from October through December 2013. Survey data were entered and analyzed by ADF&G Commercial Fisheries staff to generate subsistence salmon harvest estimates by species.

### *Estimating Kuskokwim Area Community Subsistence Salmon Harvests*

For the remaining communities in the Kuskokwim Area, the goal was to collect subsistence harvest data through harvest surveys conducted by Division of Commercial Fisheries staff beginning in the first week of October and continuing through November. The survey crew consulted with community officials before arriving in the community to update community household lists. Other resources were also useful in updating household lists, including telephone and utility records. Communities were prioritized based on transportation scheduling, staff time and community willingness to participate in the program. Participation in the surveys was voluntary, and some community leaders requested that the surveys not take place in their communities.

## Harvest Calendars

In addition to systematic household harvest surveys, subsistence salmon harvest calendars were mailed in late April or early May so that they were available to fishers prior to the start of the salmon fishing season. The calendar data continue to be instrumental for examination of subsistence salmon harvest timing. The calendars are also used by some area fishers throughout the fishing season so that they can be referenced during postseason household harvest surveys.

Calendar mailings were based on the most up-to-date household lists used in the harvest monitoring program. Extra calendars were printed and maintained at the Bethel ADF&G office for distribution as needed or upon request. In an effort to increase the use and return rate of subsistence salmon harvest calendars, public service announcements were broadcast on local radio stations during the fishing season reminding fishers to keep logging their catches on their calendars and describing the importance of calendars for documenting subsistence salmon uses.

Most subsistence salmon harvest data obtained from the returned calendars were not used to directly calculate Kuskokwim Area subsistence salmon harvest estimates, but these data were used to corroborate household survey data. Calendars were occasionally used as the primary source of harvest data when contact was not made with a particular household. Calendars often include harvests from multiple households that fished together, so reported harvests may represent the efforts of multiple households. In such cases, every effort was made to contact the head of household to verify harvest information when using the calendar data. Calendars also provided data for assigning households to the 3-user strata, especially in cases where households were not contacted as part of the household surveys. Calendar data are not provided in this report.

## Data Correction and Archiving

Division of Commercial Fisheries staff reviewed and edited all completed surveys and periodically sent reviewed surveys to staff in Bethel and Anchorage for further processing. The survey data were entered into an Arctic-Yukon-Kuskokwim Database Management System (AKDBMS) data server. The database was structured to ensure data were entered completely and accurately, and there were periodic back-ups to prevent data loss.

### Data Analysis

Community estimates of subsistence salmon harvest for surveys collected in communities outside of Bethel and Aniak were generated using a stratified random sampling expansion technique. This approach applies means to unsurveyed households within each strata group and sums total estimates of the 5 strata groups to give a community harvest estimate. Communities where harvest survey data were inadequate or unavailable, for 2013 and earlier, were estimated by employing a Bayesian hierarchical multiple imputation method. The details of these approaches are described in Shelden et al. (2014).

## 2013 SAMPLING SUMMARY

In 2013, an estimated total of 4,314 households were located in the Kuskokwim Area, excluding households in the coastal communities that declined to participate (Table 5-1): 77 % of the households were located in the Lower Kuskokwim Region, including 2,126 households (49 % of the total estimated households) in Bethel and 1,177 households (27%) in the rest of the Lower Kuskokwim communities, followed by 357 households in Middle Kuskokwim, 309 households in Upper Kuskokwim, and 90 households in North Kuskokwim Bay (Figure 5-2).

Out of the 4,314 households, surveys were conducted with 1,755 households within 25 Kuskokwim Area communities (Table 5-1). As noted above, a new method was developed in 2008 to estimate subsistence salmon harvests in communities in which no household surveys took place if adequate harvest data for previous years existed; however, there were Kuskokwim Area communities for which there were insufficient historical data to develop annual harvest estimates using a Bayesian hierarchical multiple imputation method. As a result, the Kuskokwim Management Area total should be viewed as a minimum estimate because data for some communities are not available (Simon, Krauthoefer, Koster, and Caylor 2007:20).

For lower Kuskokwim River communities, 1,197 (36%) of the 3,303 households were contacted. Based upon 2013 data, the region represents 77% of the estimated total number of households in the Kuskokwim Area.

In the south Kuskokwim Bay region (Quinhagak, Goodnews Bay, and Platinum), 138 (54%) of the 255 households were contacted. The Bering Sea coastal communities of Mekoryuk, Newtok, Nightmute, Toksook Bay, Tununak, and Chefornak had an estimated 453 total households as of 2009, but none were surveyed in 2013, and data for previous years are incomplete. Currently, subsistence salmon harvest information collected by AVCP for 2011 is the only available and reliable data source for the region (Wolfe et al. 2012).

The 13 communities of the middle and upper Kuskokwim River regions are generally smaller than lower river communities, and together compose 15% (666 households) of total households in the Kuskokwim Area. In the middle Kuskokwim River region, defined here as communities located on the Kuskokwim River from Lower Kalskag upriver to Chuathbaluk, 272 (76%) of 357 households were contacted in 2013. For upper Kuskokwim communities, defined here as communities located on the Kuskokwim River from Crooked Creek upriver to Telida (in addition to Lime Village located on the Stony River and Takotna located on the Takotna River), 148 (48%) of 309 households were contacted. Crooked Creek, Lime Village, Takotna, and Telida were not surveyed in 2013. The communities of Georgetown and Napaimute are not currently included in the community sampling list due to limited permanent populations and primarily seasonal use patterns for these 2 communities; the large majority of Georgetown and Napaimute community members are surveyed during their residence in other Kuskokwim River communities.

## 2013 SUBSISTENCE SALMON HARVEST SUMMARY

A summary of the subsistence salmon harvest estimates by community and fishing area is presented in Table 5-1. In 2013, fishers harvested an estimated total of 177,643 salmon for subsistence use from the Kuskokwim Area. People in the Lower Kuskokwim communities harvested 134,160 salmon, 76% of the

estimated total subsistence salmon harvest, including 55,237 salmon (31%) in Bethel and 78,923 salmon (44%) in the rest of the Lower Kuskokwim communities (Figure 5-3). Fishers in the Middle Kuskokwim communities harvested 18,421 fish (10%), followed by 10,771 fish (6%) in South Kuskokwim Bay, 9,874 fish (6%) in the Upper Kuskokwim, and 4,417 fish (2%) in North Kuskokwim Bay.

Chum salmon contributed 31% (54,821 fish) of the estimated subsistence salmon harvest, followed by Chinook salmon (29%, 51,211), sockeye salmon (24%, 42,996 fish), coho salmon (16%, 27,874 fish), and pink salmon (0.4%, 741 fish) (Figure 5-1). In 2013, all species of subsistence salmon harvests were below the 5-year (2008–2012) and 10-year (2003–2012) averages: Chinook salmon: 51,211 Chinook salmon (76% of 5-year average, 64% of 10-year average); 54,821 chum salmon (92% of 5-year average, 85% of 10-year average); 42,996 sockeye salmon (92% of 5-year average, 94% of 10-year average); and 27,874 coho salmon (78% of 5-year average, 73% of 10-year average) (Table 5-3). It is possible that subsistence harvesters have been targeting more abundant species in years of lower Chinook salmon abundance, and they are tied to both voluntary and involuntary changes in gear usage. Chinook salmon abundance in the Kuskokwim River drainage has decreased since 2007, with some of the lowest total runs occurring in 2011–2013 (Bue et al. 2012; Personal communication with Toshihide Hamazaki, Biometrician, May 12, 2015). Lower Kuskokwim River Area communities accounted for 76% of the total estimated subsistence salmon harvests in the Kuskokwim Area and 82% of the entire estimated Chinook salmon subsistence harvest. Residents of Bethel accounted for 31% of the Kuskokwim Area subsistence salmon harvests and 34% of subsistence-caught Chinook salmon and 45% of the estimated total of subsistence-caught coho salmon (Table 5-1).

As noted, several coastal communities within the Kuskokwim Area have chosen not to participate in the postseason subsistence harvest surveys conducted by ADF&G. However, 7 of these communities participated in a study conducted by AVCP to estimated subsistence salmon harvests for 2011 (Wolfe et al. 2012; Table 5-2). The total estimated subsistence harvest of salmon for these 7 communities in 2011 was 16,593 fish, including 7,226 chum (44%), 4,439 sockeye (27%), 2,864 coho (17%), 1,298 Chinook (8%), 746 pink (4%), and 20 salmon of unknown species (<1%).

### Use of Salmon for Dog Food

Historically, salmon harvested for use as dog food were a large portion of the overall subsistence salmon harvest; specifically, chum and coho salmon. In recent years, the number of households harvesting salmon specifically for dog food has declined, likely due to decreased use of dog teams for transportation. In 2013, data show a reported harvest of 4,784 salmon for use as dog food (Table 5-4). The majority of the salmon harvested for dog food were chum salmon, at 3,151 fish, while coho salmon accounted for 1,462 fish. Sockeye salmon contributed 127 fish and pink salmon 42 fish to the harvest for dog food. Households do not target Chinook salmon for dog food; however, 2 Chinook salmon, likely unfit for human consumption, were reported to have been fed to dogs in an effort to avoid wasting the fish. It is common for most households to feed scraps—backbones, entrails, and salmon unfit for human consumption—to their dogs.

### Gear Types

Kuskokwim Area subsistence fishers deploy a variety of gear types to harvest salmon (e.g., set gillnet, drift gillnet, fish wheel, or rod and reel) (Table 5-5). Households that harvested salmon were asked to provide information on the primary gear type used by their household for harvesting salmon. In 2013, out of 1,093 contacted fishing households that responded to gear type questions, 894 (82%) reported drift gillnets as their primary subsistence salmon fishing gear type, 118 (11%) reported set gillnets, 70 (6%) reported subsistence rod and reel gear, and 11 (1%) reported fish wheel. Preferred gear types vary between regions of the Kuskokwim Area, and fishers often select which gear type to use based on local environmental factors such as river morphology. In recent decades drift gillnets have been the most common gear type deployed by fishers in the lower and middle Kuskokwim River communities where river depth and width permit the efficient use of this type of net. In communities of the upper Kuskokwim

River, a narrower and generally shallower river channel typically restricts fishers to the use of set gillnets and occasionally fish wheels. Also, subsistence fishers who reside near clear water streams often harvest salmon by rod and reel (e.g., Kwethluk, Takotna, and Nikolai). Perhaps equally important in determining selection of gear types are local and familial customs and traditions associated with subsistence salmon fishing.

### Salmon Retained from Commercial Fishing for Subsistence Uses

Households involved in commercial salmon fishing occasionally keep a portion of their commercial harvest for subsistence uses; however, the number of salmon retained from commercial fishing activities for subsistence is usually low. In 2013, few households reported retaining commercially-caught salmon for subsistence uses. Data show a reported total of 594 salmon were retained from commercial catches, including 223 Chinook, 35 chum, 88 sockeye, 199 coho, and 49 pink salmon (Table 5-6).

## OTHER FISH

Harvest data for nonsalmon fish species are also collected as part of the postseason salmon survey. In 2012, reported harvests of nonsalmon species in the Kuskokwim Area included 12,835 humpback whitefish; 12,591 broad whitefish; 8,100 cisco; 2,158 sheefish; 10,348 burbot; 188,433 blackfish; 111,104 smelt; 20,059 Northern pike; 7,135 herring; 1,467 grayling; 9,998 char; 533 rainbow trout (Table 5-7).

The Division of Subsistence has recently conducted comprehensive subsistence harvest and use surveys in the following 20 Kuskokwim River drainage communities: in 2010 (study year 2009), Aniak, Chuathbaluk, Crooked Creek, Lower Kalskag, Red Devil, Sleetmute, Stony River, and Upper Kalskag (Brown et al. 2012); in 2011 (study year 2010), Akiak, Kwethluk, Oscarville, Tuluksak, Georgetown, and Napaimute (Brown et al. 2013); in 2012 (study year 2011), Napakiak, Napaskiak, McGrath, Nikolai, and Takotna (Ikuta et al. 2014); and in 2013 (study year 2012), Bethel (Ikuta et al. *In prep*). These comprehensive surveys included questions about salmon and nonsalmon harvests as well as harvests of wildlife and plants. In addition, the division conducted an ethnographic project to understand socioeconomic patterns and trends of subsistence Chinook salmon fishing in Tuntutuliak, Kwethluk, Kalskag, Sleetmute, and Nikolai in 2009 and in the Bethel area in 2012 (Ikuta et al. 2013). Studies focusing on the traditional ecological knowledge of nonsalmon fishes and nonsalmon harvest amounts have been conducted in Aniak and Chuathbaluk for 2001–2003 (Krauthoefer et al. 2007), Bethel for 2001–2003 (Simon, Krauthoefer, Koster, Coffing, et al. 2007), Eek, Tuntutuliak, and Nunapitchuk for 2005–2009 (Ray et al. 2010), as well as Nikolai and Lime Village for 2012–2013 (Van Lanen and Runfola 2015). Information on historical and contemporary harvest and use of salmon and nonsalmon in communities along the Kuskokwim River, where data are available, can be accessed through the Community Subsistence Information System (CSIS) on the ADF&G website.

## THE ROLE OF SALMON WITHIN ANNUAL SUBSISTENCE HARVESTS

According to the Subsistence Division's comprehensive subsistence surveys, salmon provide a large portion of the total subsistence food supply in Kuskokwim River communities (Brown et al. 2012, 2013, Ikuta et al. 2014, Ikuta and Koster in prep). In 2012, the top 5 resources harvested by edible weight were moose at 20%, chum salmon at 12%, coho salmon at 11%, sockeye salmon at 10%, and Chinook salmon at 8% of the estimated total subsistence harvest by Bethel residents (Ikuta and Koster *In prep*). It is important to keep in mind that the Chinook salmon harvest in Bethel was particularly low in 2012 due to the impact of declining Chinook salmon abundance and subsistence fishing restrictions during the Chinook salmon fishing season. In 2012, the total estimated Chinook salmon harvest in the Kuskokwim Area was 70% below the 10-year average Chinook salmon harvest for the region.

In other Lower Kuskokwim communities in 2010 (Oscarville, Kwethluk, Akiak, & Tuluksak ) and 2011 (Napakiak, & Napaskiak), the five most heavily harvested resources were Chinook salmon at 20%, chum salmon at 12%, and northern pike, sockeye salmon, and humpback whitefish in relatively similar

proportions, each from 8 to 9% of the total subsistence harvest (Brown et al. 2013, Ikuta et al. 2014). Like people in Bethel, people living in other Lower Kuskokwim communities rely on salmon and moose, yet they tend to harvest more nonsalmon fish species, such as northern pike and humpback whitefish, than people living in Bethel. Data from other Lower Kuskokwim communities from other communities in this presentation are more representative of historical data than the 2012 Bethel data because of fewer restrictions to Chinook salmon fishing in the period 2009–2011.

In the 8 Central Kuskokwim communities (Lower Kalskag, Upper Kalskag, Aniak, Chuathbaluk, Crooked Creek, Red Devil, Sleetmute, and Stony River), the 5 most heavily harvested resources in 2009 were Chinook salmon at 30% of the total subsistence harvest, chum salmon providing 15%, coho salmon at 12%, moose at 11%, and sockeye salmon at 8% of the total subsistence harvest (Brown et al. 2012). Like people in Lower Kuskokwim communities, residents of Central Kuskokwim River communities heavily rely on salmon and moose. These data demonstrate that, proportionally, Chinook salmon harvests make up a greater portion of the total annual subsistence harvest than in Lower Kuskokwim River communities, 30% compared to 20%.

In the 3 Upper Kuskokwim communities (McGrath, Nikolai, and Takotna), the top 5 resources in 2012 were moose at 45%, Chinook salmon at 14%, coho salmon at 6%, and sheefish and northern pike both at 4% of the total subsistence harvest (Ikuta et al. 2014). People in Upper Kuskokwim communities are more dependent on moose than those in Lower and Central Kuskokwim communities. Yet, Chinook salmon was ranked as the second most harvested resource, demonstrating its importance to the overall subsistence economy of the Upper Kuskokwim region.

Table 5-1.–Subsistence salmon harvests by community, Kuskokwim Area, 2013.

| Community | Households | | Estimated salmon harvest | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Total | Contacted | Chinook | Sockeye | Coho | Chum | Pink | Total |
| Kipnuk[b] | -- | -- | -- | -- | -- | -- | -- | -- |
| Kwigillingok[b] | -- | -- | -- | -- | -- | -- | -- | -- |
| Kongiganak[a] | 90 | 0 | 1,203 | 1,222 | 487 | 1,505 | -- | 4,417 |
| **North Kuskokwim Bay** | **90** | **0** | **1,203** | **1,222** | **487** | **1,505** | **0** | **4,417** |
| Tuntutuliak | 90 | 57 | 2,448 | 1,183 | 450 | 2,180 | 3 | 6,264 |
| Eek | 88 | 50 | 1,188 | 1,319 | 483 | 1,232 | 18 | 4,240 |
| Kasigluk | 104 | 49 | 2,919 | 1,470 | 418 | 2,197 | 14 | 7,018 |
| Nunapitchuk | 118 | 71 | 2,563 | 1,806 | 226 | 2,977 | 20 | 7,592 |
| Atmautluak | 63 | 37 | 1,592 | 1,316 | 203 | 2,409 | 47 | 5,567 |
| Napakiak | 97 | 51 | 1,588 | 1,105 | 634 | 1,185 | 3 | 4,515 |
| Napaskiak | 103 | 57 | 2,939 | 2,069 | 772 | 2,589 | 0 | 8,369 |
| Oscarville | 15 | 13 | 585 | 347 | 37 | 490 | 0 | 1,459 |
| Bethel | 2,126 | 519 | 17,246 | 12,616 | 12,662 | 12,506 | 207 | 55,237 |

*Note* Includes harvests using rod and reel and the removal of salmon from commercial harvests as well as subsistence nets.

a. These communities were not contacted during the 2013 study period. Harvests were estimated using historical average household harvest expanded by the number of households.

b. These communities were not contacted during the 2013 study period. Not enough data was available to estimate harvest.

-- Data not available.

# CHAPTER 6: BRISTOL BAY AREA

## BACKGROUND

In spite of numerous social, economic, environmental, and technological changes, Bristol Bay residents continue to depend on salmon and other fish species as an important source of food. Subsistence harvests still provide important nutritional, economic, and sociocultural benefits to most Bristol Bay households. The 5 species of salmon found in Alaska are utilized for subsistence purposes in Bristol Bay, but the most popular are sockeye, Chinook, and coho salmon. Many residents continue to preserve large quantities of fish through traditional methods, such as drying and smoking, and fish are also frozen, canned, salted, pickled, fermented, and eaten fresh.

## REGULATIONS

Permits are required to harvest salmon for subsistence purposes in Bristol Bay. Standard permit conditions include prohibition of fishing within 300 ft of a dam, fish ladder, weir, culvert, or other artificial obstruction. Since 1990, under state regulations, all Alaska state residents have been eligible to participate in subsistence salmon fishing in all Bristol Bay drainages. From 1998 through 2006, with 3 exceptions, only gillnets were recognized as legal subsistence gear. The first exception occurred in the Togiak District, where spear fishing was also allowed. Second, in 1998 the BOF adopted new regulations for the taking of "redfish" (postspawn sockeye salmon) in portions of the Naknek District. Thirdly, at their 2006 meeting, the BOF adopted regulation that beach seines are allowed in Iliamna Lake, Six Mile Lake, and Lake Clark. Gillnets, spears, and dip nets may be used along a 100 yd length of the west shore of Naknek Lake near the outlet to the Naknek River from August 20 through September 30, at Johnny's Lake from August 15 through September 25, and at the mouth of the Brooks River from October 1 through November 15. In the Bristol Bay Area in 2010, gillnet lengths were limited to 10 fathoms in the Naknek, Egegik, and Ugashik rivers; Dillingham beaches; and within the Nushagak commercial district during emergency openings. Up to 25 fathoms could be used in the remaining areas, except that nets were limited to 5 fathoms in the special "redfish" harvest areas in the Naknek District.

Along the Dillingham beaches, and in the Naknek, Egegik, and Ugashik rivers, subsistence fishing was limited to several fishing periods per week during the peak of the sockeye salmon run. All commercial districts were open for subsistence fishing during commercial openings. In addition, all commercial districts were open for subsistence fishing in May and October, from Monday to Friday. In the late 1990s and early 2000s, declining Chinook salmon and coho salmon stocks resulted in longer commercial closures, and some residents had difficulty obtaining fish for home uses. Since 2004, there have been improvements in abundance of all species (Jones et al. 2009:20). Since 1988, the Nushagak commercial district has been open to subsistence fishing by emergency order during extended commercial closures.

In May 2001, the National Park Service (NPS) announced that it would begin enforcing the prohibition of subsistence fishing with nets in Lake Clark National Park and Preserve, including all of Lake Clark, except by federally qualified area rural residents. This was a new enforcement action of an existing NPS regulation and was applied to individuals who were not permanent residents of Iliamna, Lime Village, Newhalen, Nondalton, Pedro Bay, or Port Alsworth, or who did not have a Section 13.44 subsistence use permit issued by the park superintendent.

ADF&G has continued to issue Bristol Bay subsistence salmon permits to those Alaska residents who request them. However, ADF&G informs permit applicants that unless they live in one of the above-named communities or have a Section 13.44 permit, they need to take this NPS closure into account when they subsistence fish in waters of the park and preserve. ADF&G also informs permittees that waters outside of national park and preserve boundaries remain open for subsistence salmon fishing to all permit holders.

## INSEASON MANAGEMENT IN 2013

From June 1 through September 30 in all waters of a commercial salmon district within the Bristol Bay region, subsistence salmon could be taken only during commercial fishing periods. For a list of 2013 commercial fishing emergency orders for Bristol Bay in commercial districts, see Table 6 in Jones et al. (2014:30). In the Nushagak District, subsistence salmon fishing was provided for by emergency order during periods of extended commercial fishing closures.

## SALMON HARVEST ASSESSMENT PROGRAM

A permit program was gradually introduced throughout the Bristol Bay region in the late 1960s to document the harvest of salmon for subsistence uses. Much of the increase in the number of permits issued during these years reflects: 1) a greater compliance with the permitting and reporting requirements, 2) an increased level of effort expended by ADF&G in making permits available (including issuance by area vendors), 3) contacting individuals to remind them to return the harvest forms, and 4) a growing regional population. Most fishers are obtaining permits and reporting their harvests, and overall permit returns have averaged between 85% and 90%. However, fish removed for home uses from commercial catches are not included in most reported subsistence harvest totals. Also, fish caught later in the season, such as coho salmon and spawning sockeye salmon, are probably not documented as consistently as Chinook and prespawn sockeye salmon.

In 2013, a total of 1,162 permits were issued for the Bristol Bay Management Area; of those 986, or 85%, were returned (Table 6-1; Table 6-2). The largest number of permits were issued for the Nushagak (584 permits) and Naknek–Kvichak (460 permits) districts (Table 6-1). The number of permits issued in 2013 was slightly above the 5-year (1,110 permits), the 10-year (1,102 permits), and the historical (1,093 permits) averages (Table 6-2).

## SUBSISTENCE SALMON HARVESTS IN 2013

Estimated total Bristol Bay subsistence salmon harvests in 2013 were 125,764 fish (Table 6-1). The 2013 salmon harvest was above the 5-year (124,787 salmon) and 10-year (125,752 salmon) averages, but below the historical (1983–2012 of 146,136 salmon) average (Table 6-2).

Chinook salmon harvests were estimated at 12,858 in 2013, a slight increase from the previous year's harvest of 12,136. Estimated sockeye salmon harvests for 2013 were 98,765, which was a little below the recent 5-year average of 98,945 fish but above the 10-year average of 97,749 fish. The historical average (1983–2012) was 114,594 fish. Because the return of pink salmon to Bristol Bay is higher in even-numbered years than odd-numbered years, the number of pink salmon harvested was significantly lower in 2013 (333 fish) than in 2012 (1,874 fish). The estimated harvest of chum salmon in 2013 (5,173 fish) was higher than both the recent 5-year (4,651 fish) and 10-year averages (4,968 fish) and below the historical average (1983–2012) of 6,395 fish. The coho harvest in 2013 (8,635 fish) was much larger than the previous year (3,837 fish) and also higher than the 5-year average at 6,312 fish, the 10-year average at 6,451 (Table 6-2) and the historical 1983–2012 average at 8,170 fish.

In 2013, the Bristol Bay subsistence salmon harvest was composed of 78.5% sockeye salmon, 10% Chinook salmon, 7% coho salmon, 4% chum salmon, and less than 1% pink salmon (Figure 6-1). Of the entire Bristol Bay Area subsistence salmon harvest in 2013, residents of Bristol Bay communities harvested 114,982 salmon (91%), and other Alaska residents harvested 10,783 salmon (9%) (Table 6-3).

In 2013, as over the last several decades, most of the Bristol Bay Area subsistence harvest was taken in the Naknek–Kvichak (50.5%) and the Nushagak (43%) districts (Figure 6-2). The Naknek–Kvichak total harvest of 63,535 salmon in 2013 (Table 6-1) was lower than in 2012 (74,578) and in 2011 (68,675 salmon). Kvichak River drainage residents within the Kvichak River–Iliamna Lake Subdistrict and other permit holders fishing in the Kvichak drainage portion of the Naknek–Kvichak District harvested an estimated 181 Chinook salmon and 42,556 sockeye salmon in 2013, while those fishing in the Naknek

River Subdistrict harvested 321 Chinook salmon and 19,587sockeye salmon (Table 6-1). The 2013 subsistence harvest of 42,556 sockeye salmon in the Kvichak drainage (Table 6-1) was lower than the 2012 harvest of 52,370 sockeye, and the 2011 harvest of 45,226 sockeye (Fall et al. 2009a:69) and below historical levels (the most recent 10-year average harvest from 2004 through 2013 was 47,559 sockeye salmon) (Jones et al. 2015:102).[1]

Subsistence sockeye salmon harvests in the Kvichak District have declined since the early 1990s (Salomone et al. 2011:113). From 1998 to 2013, estimated harvests were below the range of 55,000 to 65,000 sockeye salmon established by the BOF as the amount reasonably necessary for subsistence uses (5 AAC 01.336 (b)(1)). Poor sockeye salmon returns, like those seen in 2000–2002, are likely one factor responsible for declining harvests, but socioeconomic and sociocultural factors may be partly responsible as well (Fall et al. 2001, 2003, 2006; Fall, Turek, et al. 2009; Stickman et al. 2003).

In the Nushagak District, the total estimated subsistence harvest in 2013 of 54,176 salmon (Table 6-1) was an increase from the previous year (37,960 salmon). The next lowest estimated harvests were 39,791 salmon in 2010 and 40,373 salmon in 2006 (Jones et al. 2014:97). The estimated harvest in 2013 of 54,176 salmon was the highest since 55,159 salmon in 1994 (Jones et al. 2014:97). The 2008 estimated harvest more completely recorded harvest numbers for the season due to the administration of comprehensive baseline household subsistence harvest surveys by the Division of Subsistence in Aleknagik and Manokotak. For a more detailed description of these data see Fall et al. (2012b:75). The Nushagak District Chinook salmon harvest in 2013 was 11,602 (Table 6-1), and was an increase from the year before (10,350 fish), but lower than in 2011 (12,461). The lowest estimated harvests were 9,150 salmon in 2010 and 9,971 salmon in 2006 (Jones et al. 2014:94). The highest estimated harvest of Chinook was in 2003 with 18,686 fish.The 2013 Nushagak District sockeye salmon harvest of 30,283 fish (Table 6-1) was the highest since 1993 (Jones et al. 2014:94).

The estimated total subsistence salmon harvest for the Togiak District in 2013, 5,002 fish (Table 6-1), was lower than the previous year's estimate of 7,339 fish, but higher than the previous 10-year average (5,000 salmon) (Jones et al. 2014:95). Estimated harvests in 2002 and from 2004 through 2007 were below those for 2001 and 2003; this likely reflects at least in part the result of postseason household surveys in Togiak and Twin Hills for 2001 and 2003. Postseason household surveys included more harvesters in the estimate because fishers who did not turn in their harvest permits were contacted. Comprehensive baseline household subsistence harvest surveys conducted in Togiak for the 2008 calendar year also showed an increase in the participation in the 2008 harvest assessment program.

The estimated subsistence salmon harvest in the Ugashik District in 2013 was 672 fish, which was lower than the previous year at 1,281 fish (Table 6-1). The 2013 harvest was below than the 10-year average (2003–2012) of 1,000 fish (Jones et al. 2014:94). In the Egegik District, the estimated subsistence salmon harvest of 2,380 fish (Table 6-1) was higher than the 2012 estimate of 1,425 fish; however, the 2012 estimate was notably lower than the 4,711 fish estimated for 2004 (the second highest estimate since 1984), and was less than the previous 5-year average of 1,732 salmon (Jones et al. 2014:93).

## OTHER SUBSISTENCE FISHERIES

In May 2003, new federal regulations authorizing subsistence fishing for Pacific halibut came into effect. A harvest assessment program for the subsistence halibut fishery was implemented in 2004. Subsistence halibut harvest estimates for 2012 appear in Fall and Koster (2014). Beginning in 2003 subsistence fishing for rainbow/steelhead trout *O. mykiss* and Arctic char/Dolly Varden in the Bristol Bay Area under federal subsistence regulations required a federal permit. No permits were issued (Michael Edwards,

1. Note that the Kvichak River drainage sockeye salmon harvest total for 2007 listed in the 2008 Bristol Bay Area Annual Management Report (Jones et al. 2009:106) was adjusted down to the total of 47,473 by the Division of Subsistence. The updated data were included in the 2011 Annual Management Report (Jones et al. 2012:100). Additional harvest reports collected through subsistence salmon household harvest surveys in 4 Kvichak drainage communities increased the accuracy of the reported harvests and reduced the expansion factor for the estimated subsistence salmon harvest in the Kvichak drainage in 2007.

Fisheries Biologist, USFWS, King Salmon Field Office, personal communication, 2004). The permit requirement was dropped in 2005. The following overview derives primarily from Fall and Chythlook (1997) and Fall et al. (2009).

## Subsistence Regulations

The BOF determined that all finfishes of the Bristol Bay Management Area support customary and traditional uses (5 AAC 01.336). In addition, the BOF determined that approximately 250,000 lb usable weight (about 41 lb per person) was the amount reasonably necessary to provide for these uses. This amount was based upon estimates of fish harvests derived from systematic household surveys conducted by the Division of Subsistence. Amounts for specific species or more specific stocks were not established.

For the most part, subsistence fishing for species other than salmon and rainbow/steelhead trout is open year-round in the Bristol Bay Area with gear listed in 5 AAC 01.010 (a). There are no seasonal limits established by regulation. The following regulations apply to subsistence fishing for species other than salmon in the area:[2]

- Rainbow/steelhead trout taken incidentally in other subsistence net fisheries and through the ice are lawfully taken and may be retained for subsistence uses (5 AAC 01.310 (g)).
- Subsistence fishing with a line attached to a rod or pole is prohibited except when fishing through the ice (5 AAC 01.320 (l)).
- Subsistence fishing with nets is prohibited in 18 waters of the Kvichak–Iliamna Lake drainage and within one-quarter mile of the terminus of those waters from September 1 through June 14.

## Subsistence Harvests and Uses

A detailed description of subsistence uses of freshwater fishes in the Bristol Bay Area appears in Fall et al. (1996) and Holen and Lemons (2012). Holen et al. (2012) and Wright and Chythlook (1985) describe the uses of herring spawn on kelp in the Togiak District. Harvests of fish other than salmon contribute about 10% of the annual subsistence harvests of wild foods in the Bristol Bay region, about 41 lb per person (Fall, Krieg, et al. 2009; Holen and Lemons 2012).

Subsistence harvests of fish other than salmon are not annually monitored by ADF&G. Harvest and use data are available for most communities through Division of Subsistence household harvest surveys (BBNA and ADF&G 1996; Coiley-Kenner et al. 2003; Evans et al. 2013; Fall et al. 2006; Holen et al. 2011; Holen, Stariwat, et al. 2012; Krieg et al. 2005, 2009). As part of an OSM project (02-034, Subsistence Fisheries Assessment: Kvichak River Watershed Resident Species), the Division of Subsistence and the Bristol Bay Native Association collected subsistence harvest data in Kvichak River watershed communities from October 2002 to September 2003. The final report for that project (Krieg et al. 2005) includes detailed information about uses of nonsalmon fish in 8 study communities. Some of the findings of ADF&G research regarding nonsalmon fish are summarized in Table 6-4. The vast majority of households in the Bristol Bay Area use fish other than salmon for subsistence purposes. Most households also participate in the harvest of these fish. Harvests, as measured in pounds usable weight per person for available study years, vary from community to community and from year to year, but generally make important contributions to annual subsistence harvests. Fish other than salmon generally rank third behind salmon and land mammals in their contribution to the total subsistence harvests in Bristol Bay communities.

Harvests and uses of the nonsalmon fish listed in Table 6-5 have been documented in Bristol Bay communities through Division of Subsistence research. Uses of other species may occur: fish taken in the

2. In 2004, the BOF eliminated a permit requirement for subsistence fishing for rainbow/steelhead trout and Arctic char/Dolly Varden in the Bristol Bay Area. ADF&G had not developed a program for issuing these permits.

largest quantities in the area as a whole include smelt, whitefishes, Dolly Varden, Arctic grayling, and northern pike (see Fall et al. [1996] for a summary of harvest data).

In the Bristol Bay Area, harvests of nonsalmon finfish occur throughout the year. Harvest effort for these fish is generally lower among Bristol Bay residents in the summer because attention is focused on salmon. Spring is important for herring, herring spawn on kelp, and rainbow smelt. Harvests of nonsalmon fish occur in winter. "Smelting" is a popular activity in October and in late winter when these fish can be caught by jigging. Halibut are mostly taken in June and July (Wright et al. 1985:34).

Many gear types are used to harvest nonsalmon fish for home uses in the Bristol Bay Area. Rod and reel is used for most fish; some, such as Arctic char/Dolly Varden and herring and other marine fishes, are removed from commercial catches. Other methods are used, including (but not necessarily limited to) the following:

- Traps (fyke nets): Alaska blackfish, burbot*;*
- Set hooks: burbot;
- Handline jigging through the ice: Arctic grayling, Arctic char/Dolly Varden, lake trout, rainbow smelt, rainbow/steelhead trout, whitefishes, northern pike;
- Set gillnets: Arctic grayling, Arctic char/Dolly Varden, lake trout, longnose suckers, rainbow/steelhead trout, herring, northern pike, burbot, whitefishes;
- Beach seining: Arctic char/Dolly Varden, lake trout, rainbow smelt, herring, whitefishes;
- Hand line in open water: Pacific halibut, rainbow/steelhead trout; and
- Dip nets: rainbow smelt, herring.

Herring spawn on kelp is usually picked by hand, although rakes, knives, and *uluaqs* (women's knives) are also used (Schichnes and Chythlook 1988:127).

Maps of areas used by Bristol Bay communities to harvest nonsalmon fish appear in the *Alaska Habitat Management Guide Reference Atlas* series (ADF&G 1985), and in Wright et al. (1985). Updated maps of harvest locations for 8 communities in the Kvichak watershed appear in Krieg et al. (2005). Harvest activities occur throughout the region in most rivers and lakes as well as along shorelines. It is likely that most effort occurs near each community and near seasonal camps such as Kulukak. See Wright and Chythlook (1985) and Schichnes and Chythlook (1988) for maps of herring camps at Kulukak Bay. For frequency of uses of various areas for freshwater fishing by Nushagak River communities, see Schichnes and Chythlook (1991) and by Togiak and Manokotak, see BBNA and ADF&G (BBNA and ADF&G 1996).

Bristol Bay residents use a wide variety of methods to process and preserve their harvests of fish other than salmon. These vary by species and community. Some freezing of harvests of most species occurs. Some examples of other methods include the following:

- Arctic grayling: dried, half-dried, fresh frozen, aged frozen and eaten with seal oil (various species);
- Dolly Varden: dried, smoked, half dried (*egamaarrluk*);
- Northern pike: dried, half-dried, fresh frozen, aged frozen and eaten with seal oil;
- Rainbow/steelhead trout: dried, half dried, smoked; and
- Whitefishes: dried, fresh frozen, aged frozen and eaten with seal oil.

Dried fish products are eaten with seal oil. Fat from brown bears *Ursus arctos* mixed with dry fish is also consumed. Rainbow smelt are fried, boiled, dried, or eaten frozen with seal oil (Fall et al. 1986:100; Fall, Krieg, et al. 2009). Herring are salted, or split, dried, and smoked (Schichnes and Chythlook 1988:126). The heads and stomachs of northern pike are boiled and eaten (Schichnes and Chythlook 1991:139). Freshwater fish that are usually eaten frozen with seal oil form a category called *kumlaneq*. This includes Arctic grayling, whitefishes, lake trout, and northern pike (Fall et al. 1986:102; Fall, Krieg, et al. 2009).

There is much traditional knowledge of the subsistence uses of nonsalmon fish in the Bristol Bay Area. For example, a Yup'ik taxonomic classification system for freshwater fish species has 3 entries, and thus 3 taxons, for the fish that Western science classifies in only 1: Dolly Varden. The Yup'ik distinctions are made depending upon the condition of the flesh for aging, freezing, and/or drying; harvest locations; and harvest methods (Fall et al. 1996; Fall, Krieg, et al. 2009).

The Division of Subsistence has compiled a traditional ecological knowledge (TEK) database, "From *Neqa* to *Tepa*," about the fish of Bristol Bay based on interviews with area residents in 2003 as part of OSM project 01-109.[3] An expanded version of the database incorporating findings from 8 Kvichak watershed communities was renamed "From *Neqa* to *Tepa*, *Łuq'a* to *Chuqilin*" to reflect the addition of Dena'ina Athabascan TEK (BBNA and ADF&G 1996; Krieg et al. 2005).

a. Nushagak River villages.

b. Manokotak, Aleknagik, Twin Hills, Togiak.

c. Also includes the closely related Arctic char.

d. At Togiak, Manokotak, and Aleknagik, and perhaps elsewhere, there are three Yup'ik names for Arctic char/Dolly Varden. Yugyak probably refers to resident char/Dolly Varden. Anerrluak, called "Togiak trout" in the local English dialect, probably refers to anadromous fish taken in fresh water. Finally, anyuk or "sea run dollies" are Dolly Varden or Arctic char taken in salt water. See Fall et al. (1996:16–20) for further discussion of these distinctions.

e. Broad whitefish are rare to absent in the Bristol Bay region. *Akakiik* is the word used at Aleknagik and Manokotak to refer to whitefish they receive from Kuskokwim River communities, where broad whitefish are common. Humpback whitefish are caught in the Iliamna Lake subregion and called *uraruq*. *Uraruq* is also used for round whitefish in the Togiak and Nushagak drainages.

# CHAPTER 7: CHIGNIK MANAGEMENT AREA

## BACKGROUND

The Chignik Management Area (CMA) encompasses all coastal waters and inland drainages on the south side of the Alaska Peninsula from Kilokak Rocks at the southern entrance to Imuya Bay at 57 degrees 10.34'N. lat., 156 degrees 20.22' W. long., then due south to Kupreanof Point at 55 degrees 33.98' N. lat. 159 degrees 35.88' W. long. (5 AAC 15.100).[1] There are 5 communities in Alaska Department of Fish and Game's (ADF&G) salmon Chignik Management Area (CMA): Chignik with a 2013 estimated population of 92, Chignik Lagoon (population 78), Chignik Lake (population 76), Perryville (population 120), and Ivanof Bay (population 7) (Figure 7-1).[2] All of these communities are within the Lake and Peninsula Borough, and virtually all area residents participate in harvesting salmon in the CMA. Published Division of Subsistence reports for the CMA include annual salmon permit harvest reports, sporadic household surveys, and subsistence salmon ethnography studies.

The Division of Subsistence household harvest surveys show that salmon compose approximately 45% of all resources harvested, by weight, for subsistence in these communities (Fall et al. 1995). Chignik subsistence salmon permits are issued annually by CMA vendors, with harvest reports due to the department by December 31. The 2013 estimated total subsistence salmon harvest was 8,433 salmon; 78% sockeye salmon, 11% coho salmon, 8% pink salmon, 2% chum salmon, and 1% Chinook salmon (Table 7-1; Figure 7-2).

In 1993, the BOF made a positive determination that salmon in the CMA are customarily and traditionally taken or used for subsistence (a "positive C&T finding") and specified amounts of salmon are reasonably necessary for subsistence (ANS) in each CMA district. In 2002, the BOF modified the original finding for ANS (5 AAC 01.466 (a) and (b)) (ADF&G 1994). The current amounts necessary for subsistence for Chignik Bay, Central, and Eastern districts combined are 5,200–9,600 early-run sockeye salmon; 2,000–3,800 late-run sockeye salmon; 100–150 Chinook salmon; and 400–700 salmon other than sockeye or Chinook salmon. In the Perryville and Western districts combined, the ANS findings are 1,400–2,600 coho and 1,400–2,600 salmon other than coho salmon. The BOF has also set an ANS for rainbow/steelhead trout *O. mykiss* at 200–300 fish and for finfish other than salmon and rainbow trout at 15,200–22,800 pounds of usable weight.

## REGULATIONS

Current (2013–2014) State of Alaska regulations governing subsistence salmon fishing in the Chignik Management Area require that to fish, an individual must obtain an annual subsistence salmon permit, and must be an Alaska resident (5 AAC 01.480).[3] Annually, permits are available locally at the Chignik ADF&G weir facility and from local CMA community vendors. The permit holder must record daily salmon harvests directly on the permit and return it to the Alaska Department of Fish and Game by December 31. Catch information obtained from subsistence permits is compiled annually and used to assess regional subsistence salmon fisheries. There is an annual limit of 250 salmon per permit. (5 AAC 01.480(b)(c)).

Under state regulations, all waters within the CMA are open year-around for subsistence fishing except for the following areas or conditions:

1. Alaska Department of Fish and Game. 2011–2014 Chignik and Kodiak Areas, commercial salmon fishing regulations, 89. Alaska Department of Fish and Game, Juneau. http://www.adfg.alaska.gov/static/regulations/fishregulations/pdfs/commercial/ChigKod-2011-14.pdf
2. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage: Population Estimates." Accessed July 2015. http://laborstats.alaska.gov/pop/popest.htm
3. Alaska Department of Fish and Game. 2013-2014 Subsistence and personal use statewide fisheries regulations, 37. Alaska Department of Fish and Game, Juneau. http://www.adfg.alaska.gov/static/regulations/fishregulations/pdfs/commercial/Subsistence-PU-2013-2014.pdf

- Only Alaska residents are eligible to obtain a CMA subsistence salmon permit and may fish in the areas open to subsistence at any time. An Alaska resident commercial Chignik Area salmon fishing license holder (includes CFEC Permit and crewmember license holder) may subsistence fish during a commercial salmon fishing period, except for 12 hours before a commercial salmon fishing period and 12 hours after a commercial salmon fishing period (5 AAC 01.485).
- Legal gear includes seines and gillnets. Purse seines may not be used in Chignik Lake (5 AAC 01.470(a)). Additionally, any gillnet that is fixed, anchored, or otherwise held in place may not obstruct more than one half of the width of any stream open to subsistence fishing. All subsistence salmon fishing gear must be marked with a buoy listing the first initial and last name as well as the address of the person operating the gear (5 AAC 01.010(h)). Subsistence users must carry their subsistence fishing permit with them while fishing.
- Subsistence salmon fishing is permitted in the Chignik River; however, salmon may not be taken upstream from the ADF&G weir to the outlet of Chignik Lake from July 1–August 31 (5 AAC 01.475(1)), which is closed to protect the spawning Chinook salmon. The Chignik River, beginning 100 yards below the weir, is open to subsistence salmon fishing year round.
- Subsistence fishing is closed within 100 yards above or below the Chignik weir when it is operational (5 AAC 01.470).
- Subsistence fishing is closed year-round in Black Lake or any tributary to Black Lake or Chignik Lake, except the waters of Clark River and Home Creek from each of their confluences with Chignik Lake to a point 1 mile upstream (5 AAC 01.475(2)). The Alaska Board of Fisheries amended the subsistence regulations in 2008 to include these tributaries for the purposes of providing additional harvest opportunities for subsistence users.

## RECENT REGULATORY HISTORY

Subsistence harvest patterns in the CMA are often influenced by Chignik commercial salmon fisheries since many of those who commercial fish are also subsistence harvesters. Regulations for subsistence salmon fishing are tied to Chignik commercial fishing operations. Prior to 2002, the CMA commercial fishery was managed by ADF&G as a competitive limited entry permit fishery. Pre-2002 regulations allowed subsistence fishing with seine and gillnet gear and required an individual permit with a seasonal limit of 250 salmon. Purse seines could be used to harvest subsistence salmon, except in Chignik Lake, which has been open by regulation to subsistence salmon fishing with gillnets or hand seines since 1985 (Morris 1987:185). Also prior to 2002, CMA commercial salmon harvesters could not subsistence fish between June 10 and September 30, although they were allowed to remove salmon caught during commercial openings for home use. Subsistence salmon fishing was not allowed in Chignik River upstream of the ADF&G weir site to Chignik Lake, in tributaries to Chignik Lake, or in Black Lake.

From 2002 to 2005, the CMA commercial salmon fishery was managed based on 2 management plans: the Chignik Area Management Plan (“competitive fishery”) and the Chignik Area Cooperative Purse Seine Salmon Management Plan ("cooperative fishery"; Stichert 2007a). After development of the cooperative fishery, ADF&G management staff initiated subsistence permit conditions in 2003 that increased subsistence harvest opportunities for commercial fishing license holders.[4] By regulation, commercial fishing permit holders could not subsistence fish for salmon from 48 hours before the first

4. Regulations providing for a cooperative commercial salmon fishery in CMA were invalidated by a decision of the Alaska Supreme Court and have not been operative since 2005.

commercial salmon fishing opening through September 30. Subsistence fishing permit conditions allowed commercial permit holders who were not engaged in commercial fishing during an opening for cooperative or competitive fleets to subsistence fish during commercial openings, after registering with ADF&G.

In 2004, through emergency order, ADF&G allowed subsistence salmon fishing within the Chignik River, excluding the waters 100 yards upstream and downstream of the Chignik weir, through June 30. Regulations had closed the Chignik River to subsistence salmon fishing (5 AAC 01.475) until 2006. In addition to obtaining a subsistence permit, commercial harvesters wishing to subsistence fish after the first commercial opening were allowed to do so, with a requirement to register with ADF&G staff working at the weir. ADF&G established a subsistence fishing schedule for these commercial harvesters depending upon whether they fished for the cooperative fleet or independently (Bouwens 2004).

At its 2004 meeting, the BOF adopted regulations to increase subsistence fishing opportunities for commercial salmon fishing license holders by allowing them, with certain restrictions (5 AAC 01.485), to harvest subsistence salmon during the commercial salmon fishing season. In addition, the BOF directed ADF&G to manage for an increase in escapement of sockeye salmon during the August commercial fishery (from 50,000 to 75,000), in order to enhance late-season subsistence opportunities in Chignik Lake. Although the commercial fishery was limited in August, the sockeye escapement goal was not achieved in 2005 (Bouwens 2005). In 2005, the BOF opened the Chignik River drainage to subsistence fishing, except for waters within 300 feet of the weir, and except for a July 1 through August 31 closure upstream of the weir to protect spawning Chinook salmon (Stichert 2007b).

The cooperative fishery plan was repealed by the Alaska Supreme Court in March 2005, but the BOF reestablished the cooperative management plan by emergency regulation because there was not enough time between the ruling and the 2005 fishing season for co-op members to revert back to fishing as independent fishers. Since 2006, however, the CMA commercial fishery has been managed solely under the *Chignik Salmon Management Plan* as a competitive fishery (Stichert 2007b).

During its January 2008 meeting, the BOF adopted regulatory changes to subsistence fishing in the CMA that allowed subsistence salmon fishing in Clark River and Home Creek from their confluences with Chignik Lake upstream 1 mile. The use of gillnets for subsistence fishing in the CMA remained legal, but when they are fixed, anchored or otherwise held in place, they may not obstruct more than one-half of the stream that is open to subsistence salmon fishing (Jackson 2009).

The Village Council of Chignik Lake submitted a regulatory proposal at the CMA BOF meeting in January 2011. The proposal, if adopted, would have legalized subsistence fishing in the only areas in the CMA closed under state regulations—Chignik Lake, Black Lake, and all tributaries to both lakes—as well as legalized the use of hook and line gear for late-run spawned-out sockeye salmon in Clark River and Home Creek (Alaska Board of Fisheries 2011a). The BOF took no action on the proposal; however the Federal Subsistence Board (FSB) adopted a similar regulation for the CMA at its January 2011 meeting (Alaska Board of Fisheries 2011b; 76 FR 45:12566, 12578–12579 [March 8, 2011]; 36 CFR 242.27 (e) (8)).

At the FSB regulatory meeting January 24, 2013, the FSB adopted a proposal submitted by the Chignik Lake Traditional Council to allow the harvest of salmon in the Chignik River, with rod and reel, from a point 300 feet upstream of the AF&G weir to Chignik Lake from January 1 through August 9, with no daily harvest or possession limit under the authority of a federal subsistence fishing permit. In addition the FSB adopted a regulation allowing the taking of salmon by gillnet in Black Lake or any tributary to Black or Chignik lakes. The BOF closed this portion of the river in 2004 to protect spawning Chinook

salmon, and it remains closed for subsistence fishing July 1–August 31, but open to sport fishing, under state regulation.[5,6]

In 2013, escapement goals for Chignik River Chinook salmon (king salmon) were never achieved. Effective July 27, 2015, ADF&G Division of Commercial Fisheries released an emergency order that in an effort to conserve Chignik River Chinook salmon, and took the following actions: effective July 27, 2013 until December 31, 2013, Chinook salmon in the Chignik River drainage from Mensis Point upstream including Chignik Lake and its tributaries could not be retained in the subsistence fishery, and the sport fishery for Chinook salmon was closed. In addition, commercial fishers fishing within the Chignik Bay and Central districts of the CMA were not allowed to retain any Chinook salmon 28 inches or greater in length and any caught had to be returned to the river unharmed.[7,8]

The Alaska Board of Fisheries at their December 2013 meeting adopted a board-generated proposal to codify a management measure first established through board intent language adopted in 2004. The management measure is intended to ensure inriver harvest opportunities above the Chignik River weir to satisfy late-run subsistence harvests. To do so, the department shall manage for 50,000 sockeye salmon, in addition to late run escapement needs, which shall be comprised of 25,000 fish in August and 25,000 fish from September 1–15 (5 AAC 15.357(b)(3)).[9]

## HARVEST ASSESSMENT PROGRAM

Estimates of annual CMA subsistence salmon harvests are based on annual permit returns combined with periodic post permit household surveys in the CMA communities. The Division of Commercial Fisheries conducted its first subsistence salmon harvest assessment in the CMA in 1976. Subsistence harvest assessments for salmon have been conducted annually since then. Beginning in 1980, any fishers who chose to harvest their subsistence salmon from the Chignik Management Area had to obtain a permit. The Division of Subsistence assumed responsibility of the harvest assessment program from 1993–2011. In 1993, the Division of Subsistence obtained copies of all available subsistence permits for the CMA from the Division of Commercial Fisheries' archive in Kodiak. Permits issued prior to 1980 and for 1987 could not be located. Since 1993, harvest data from returned permits have been expanded by community of residence to estimate the harvest by all permit holders. Data from returned permits are tabulated by species and fishing area. Starting in 2012, the Division of Commercial Fisheries resumed the responsibility due to funding losses for the Division of Subsistence's harvest assessment program.

All permit data were entered into a database. The estimated harvests developed in this database and reported in subsequent Division of Commercial Fisheries reports differ slightly from those reported in earlier reports for several reasons. There are small discrepancies in some years in the number of permits issued or returned. Estimated harvests in earlier reports were based on a simple expansion from harvests reported on returned permits to the total number of permits issued.

The method of permit issuance in the communities varies by community and year, depending on the availability of vendors and other arrangements in place with area organizations. Permits are also issued upon request at the Chignik River fish weir by Division of Commercial Fisheries' seasonal staff, as well as from local community vendors. Chignik subsistence salmon permits must be returned by mail to the

Alaska Department of Fish and Game by December 31 of the year issued. Permits include a harvest report that fishers are required to complete. The report asks for the dates fished, the specific locations fished, and the number of each species of salmon caught on each day. Nonresponses are sent reminder letters, and those that return their permit are automatically issued a new permit the following year. In addition, from 1993–2008, and 2011, the Division of Subsistence administered face-to-face household subsistence salmon harvest in order to collect harvest information from households that subsistence fished but did not obtain a permit, or did obtain a permit, but had not returned their permit to the department at the end of the year. Survey technicians trained and hired by the Division of Subsistence from each community attempted to contact all households in the CMA. Surveys were generally conducted during January, February, and March. Respondents were asked questions similar to those included on the permit as well as additional questions regarding late season harvests and whether their subsistence needs were met.

Increases in permits issued and returned beginning in 1993–2007, and consequently higher harvest estimates, reflect the use of area vendors to issue permits as well as postseason surveys conducted by ADF&G staff and area research assistants. Comparisons of household survey data and permit data collected for 1984, and 1989 suggested that permit data underestimated subsistence harvests in the Chignik Area subsistence salmon fishery (Hutchinson-Scarbrough and Fall 1996:27).[10] With the assistance of area permit vendors, ADF&G Chignik weir staff, research assistants, and area governments, subsistence salmon harvest assessments for most recent years, with some exceptions, have resulted in more reliable estimates of the total harvest.

While subsistence salmon permits are issued to an individual, other members of a household can acquire additional permits if more fish are needed. Therefore the number of permits per household, and per community, can vary each year and may not necessarily represent a change in population or household size.

The number of permits issued as well as total salmon harvest estimates have fluctuated over time; but have declined overall in recent years. The reason for decline is not clearly understood; however, year-round populations in most CMA communities have declined as well, and there have been fewer participants in CMA commercial fisheries, which provide the main economic mainstay of these communities. Declining participation may be due to lower salmon prices, increased costs in maintaining boats and associated fishing expenses, a downturn in Alaska and U.S. economies, and a co-op commercial salmon fishery that occurred between 2002–2005 that resulted in numerous boats not fished that faced considerable repair and maintenance costs when the co-op fishery terminated and the limited entry only system resumed.

## CMA Subsistence Salmon Harvests

In 2013, the number of subsistence permits issued for the Chignik Area totaled 112 permits, and 96 (86%) were returned to the department. The previous year, was similar with 106 permits issued and 87 returned, a return rate of 82%. Since 1977, the number of subsistence salmon permits issued for the Chignik Area has averaged 104 per year, with 71 permits (68%) returned. Over the last 10 years (2003–2012), the average has been 112 permits issued and 85 permits (76%) returned, and the recent 5-year average (2008–2012) was 102 permits issued and 81 (79%) returned (Table 7-1).

Harvest reports printed on the back of subsistence salmon permits direct fishers to record each species of salmon they harvest. In 2013, the total estimated CMA salmon harvest was 8,433 fish, which was nearly the same as 2012 (8,242 fish, a 191 fish difference). The 2013 total harvest was 17% (1,707 fish) less than the recent 5-year average of 10,140 fish, and also well below the 10-year average of 11,259 fish and the 1977–2012 historical average of 11,254 fish (Table 7-1).

10. See also Hutchinson-Scarbrough, Lisa, and Meredith Ann Marchioni. *In prep.* Chignik Bay, Chignik Lagoon, Chignik Lake, and Perryville: An Ethnographic Study of Traditional Subsistence Salmon Harvests and Uses. Alaska Department of Fish and Game Division of Subsistence Technical Paper No. NNN, Anchorage. Hereafter cited as (Hutchinson-Scarbrough and Marchioni *In prep*).

The 2013 total salmon harvest consisted of 78% sockeye (6,588), a slight increase (15%) of 981 fish from the 2012 sockeye salmon harvest (5,607). Coho salmon made up 11% (916) of salmon harvested in 2013, far below (38%) the 2012 harvest of 1,488. Pink salmon represented 8% of the total salmon harvest in 2013 with a total of 686 fish, which was less than the 2012 harvest of 810. There were also 164 chum salmon harvested in 2013 (2% of the total), 56 (8%) fewer than in 2012. Chinook salmon composed 1% (79) of the 2013 salmon harvest, which was 33 (32%) fewer Chinook salmon than estimated harvested in 2012 (Table 7-1; Figure 7-2).

The 2013 composition of harvest was consistent with the recent 5-year, 10-year, and historical averages for the Chignik Management Area. The recent 5-year average (2008–2012) composition of the total salmon harvest (10,140) in the CMA comprised 76% sockeye (7,661), 13% coho (1,363), 8% pink (816), 2% chum (198), and 1% Chinook salmon (100) (Table 7-1; Figure 7-3). The 10-year average (2003–2012) composition of total salmon harvested (11,259) comprised 74% sockeye (8,277), 15% coho (1,664), 8% pink (949), 2% chum (227) and 1% Chinook salmon (142) (Table 7-1; Figure 7-4). The historical average (1977–2012) of the Chignik Management Area's total salmon harvest is 11,254 fish and has comprised an estimated 78% (8,739) sockeye, 12% (1,296) coho, 8% (883) pink, 2% (252) chum, and 1% (84) Chinook salmon (Table 7-1; Figure 7-5).

## CMA Subsistence Salmon Harvests by Community

The majority of individuals who do their subsistence salmon fishing in the Chignik area are residents of Chignik Lake, Chignik Lagoon, Chignik Bay, Perryville, and Ivanof Bay. CMA residents have consistently held the majority of the CMA subsistence salmon permits and are responsible for the majority of the reported salmon harvest each year. In 2013, 69% of permits (77) were issued to CMA residents, and they were responsible for 86% of the harvest (7,223 fish) while residents of other parts of Alaska held 34 permits (31%) and harvested 14% (1,209 fish) of the total salmon harvest (Table 7-2; Figure 7-6).

Perryville harvested more salmon than all the other communities harvesting salmon in the CMA, with a harvest of 2,298 total salmon representing 27% of the total CMA subsistence salmon harvests. Chignik Lagoon harvested the second highest amount of salmon (1,863) representing 22%, followed closely by Chignik Lake, with 1,740 salmon representing 21% of total salmon harvested in the CMA. Chignik Bay (1,010 salmon or 12%) and Ivanof Bay (312 salmon or 3%) harvested the least amount of salmon by community in the CMA. All other communities outside the CMA that participated in the CMA fishery in 2013 harvested a combined total of 1,209 salmon representing 14% of the total Chignik Management Area salmon harvest (Table 7-2; Figure 7-6).

### Community Salmon Harvests by Species

In 2013, the total sockeye salmon harvest in the CMA (6,588 fish) was apportioned as follows: Chignik Lagoon 1,762 (27%), Chignik Lake 1,647 (25%), Perryville 1,116 (17%), residents of other Alaska communities 1,088 (17%), Chignik Bay 905 (14%), and Ivanof Bay 70 (1%). Chignik Lagoon residents' 2013 sockeye salmon harvest of 1,762 was about the same as their 2012 harvest of 1,771 sockeye. Chignik Lake's 2013 estimated sockeye salmon harvest (1,647) was greater (19%) than what it was in 2012 (1,338). Perryville's 2013 harvest of 1,116 sockeye salmon was a 31% decline from their 2012 sockeye harvest of 1,607, and Chignik Bay's estimated harvest in 2013 (905) was significantly (58%) greater (383) than the previous year. Non-local residents harvested an estimated 1,088 sockeye in 2013, which was a notable increase from 2012 (60%) where only 436 sockeye were estimated harvested (Table 7-2; Figure 7-6; Figure 7-7). Researchers were told by residents of Chignik Lake and Chignik Lagoon that in 2011 the early run of sockeye was one of the largest in history, but that the late sockeye runs in 2012 and 2013 had poor returns, and that this explains the low harvest rates those years (Hutchinson-Scarbrough and Marchioni *In prep*).

Coho were the second most harvested species of salmon in the CMA, totaling 916 salmon in 2013, a significant decline (62%) from 2012's estimated harvest of 1,488 and the second lowest since 1992 (Table 7-1). As in all previous years, Perryville harvested the majority of coho salmon with a total of 513 harvested, which represented 56% of the total CMA coho harvests in 2013, which was significantly less (62%) than the 2012 harvest of 1,094. Perryville residents also harvested the highest numbers of pink and chum salmon in 2013, responsible for 83% (670) of pink and 55% (90) chum salmon harvests in 2013 (Table 7-2; Figure 7-7). Chignik Lake, Chignik Lagoon, and Chignik Bay are all close to strong sockeye salmon runs and therefore the majority of their salmon harvest is sockeye. Perryville is far from the other 3 communities and the Chignik River sockeye salmon runs, but they do have local coho, pink, and chum salmon runs that they target for subsistence. The majority of sockeye salmon harvested by Perryville residents are obtained from residents who commercial fish. There are fewer flights to Perryville each week than Chignik Lake, Chignik Lagoon, and Chignik Bay, and Perryville has no grocery store, making the residents of Perryville especially reliant on subsistence foods.

## Location of Harvest

Subsistence salmon permits require people to record their harvest by species, date, quantity, and location. Table 7-3 shows the 2013 reported subsistence salmon harvests by species and by general locations within the CMA identified by the Division of Subsistence as: Chignik Bay and Lagoon Subarea, Chignik Lake Subarea, and Perryville Subarea. The following section describes reported salmon harvests, by location and species for 2013, obtained from 63 returned permits for a total of 4,536 salmon. This included 2,652 salmon in the Chignik Bay/Lagoon subarea (Central, Eastern, and Chignik Bay commercial management districts [CMD], excluding areas above Mensis Point at the mouth of Chignik River at high tide in Chignik Lagoon), which represented 59% of the total reported harvest by location. Sockeye salmon (2,471 fish) made up the largest portion of the harvest in this subarea and represented 93% of the subarea harvest and 61% of the overall CMA sockeye harvest. The majority of coho salmon harvested in the CMA were also harvested from this area with a harvest of 95 (54%) out of 176 harvested (Table 7-3).

The Chignik Lake subarea includes all waters of the Chignik River drainage above Mensis Point in Chignik Lagoon, including the Chignik River, Chignik Lake, and Chignik Lake tributaries. The reported subsistence harvests in the Chignik Lake Subarea totaled 1,491 salmon, which represented 33% of reported harvests of all salmon by location. The majority of salmon harvested in this subarea were sockeye, totaling 1,451 (97%) of all salmon harvested for this area, and sockeye harvested from this area represented 36% of sockeye taken from the entire CMA. The Perryville Subarea corresponds to the Perryville and Western CMA commercial fishing districts. The reported salmon harvests in the Perryville subarea totaled 394 salmon, which represented 9% of all salmon harvested in CMA. The Perryville Subarea was responsible for the majority of the CMA's harvest of pink salmon with a total of 127 fish reported harvested, which represented 69% of all CMA pink salmon harvested (185). In all prior years, the Perryville area ranked highest of all subareas for coho, pink, and chum salmon harvests; however, in 2013 this area placed second below the Chignik Bay and Lagoon subarea for reported coho salmon harvests (67 or 39%) as well as chum salmon harvests (36 or 47%) (Table 7-3).

Table 7-4 shows reported CMA subsistence salmon harvests by species, fishing location, and date in 2013. Harvest dates are divided into two periods of time, before and after July 5, because of the early and late sockeye run up the Chignik River. In 2013, 58% of the total subsistence salmon harvest and 53% of the sockeye salmon harvest took place on or after July 5. Chignik Lagoon was the primary subarea where total salmon as well as sockeye salmon were harvested during both early and later time periods (Table 7-4).

## GEAR TYPE

Purse seines, hand seines, and gillnets are all allowable gear types for the harvesting of salmon for subsistence in the Chignik Management Area under state regulations. CMA subsistence salmon permits do not require that fishers record their gear type. Rod and reel or hook and line are sometimes used to harvest subsistence salmon under federal subsistence regulations (Hutchinson-Scarbrough and Fall 1996; Hutchinson-Scarbrough et al. 2010; Hutchinson-Scarbrough and Marchioni *In prep*).

## FEDERAL SUBSISTENCE FISHERY IN CMA

Federal subsistence fisheries are authorized in portions of the CMA for the permanent residents of the CMA communities.

Federal regulations in the CMA apply to waters within or adjacent to the Alaska Peninsula National Wildlife Refuge, Aniakchak National Monument and Preserve, and the Alaska Maritime National Wildlife Refuge. Federal and state subsistence regulations in the CMA generally parallel each other; however, federal regulations authorize additional gear, harvest locations, and harvest seasons in portions of the CMA not authorized by the state. Starting in 2013, the federal program established a limited harvest assessment program where a federal permit would be required in order for local residents of the CMA communities to havest salmon in specific locations and/or with specific methods or seasons that are allowded by federal regualtions but not state regulations in the federal lands and waters of the CMA. For example, a Federal subsistence permit is required, in addition to a state subsistence fishing permit, to take salmon upstream of the Chignik River weir from January 1–August 9 using a rod and reel, with no daily harvest or possession limit, and to take salmon by gillnet in Black Lake or any tributary to Black or Chignik lakes. Additional information about the federal subsistence fishery is available by contacting the United States Fish and Wildlife Service, Office of Subsistence Management in Anchorage, AK.

## SALMON REMOVAL FROM COMMERCIAL HARVESTS FOR HOME USE ("HOME PACK")

Commercial fishers may also retain finfish from lawfully taken commercial catch for their home use, including use for bait under 5 AAC 39.010 (called "home pack" by area residents). These fish, if taken, are required to be reported on the commercial fish ticket and not on the subsistence salmon permit. Reported harvests are included in the ADF&G Division of Commercial Fisheries CMA annual finfish management reports. In 2013, Chignik commercial fishing boats reported removing 587 sockeye, 85 Chinook, and 28 coho salmon from their commercial harvest for home pack (Anderson et al. 2013 Table 7-5).

## OTHER CHIGNIK AREA SUBSISTENCE FISHERIES

Estimates of subsistence halibut harvests for eligible communities and tribes, including those of the CMA, are available for 2012 (Fall and Koster 2014).

Although state regulations require a subsistence permit for the harvest of rainbow/steelhead trout and Arctic char/Dolly Varden, there are no annual harvest assessment programs for the other subsistence fisheries of the Chignik Area. The BOF, in an update of its C&T finding in January 2002, identified positive subsistence uses of all finfishes in the Chignik Area. Table 7-6 lists the finfishes other than salmon for which subsistence uses have been documented through systematic household interviews conducted by the Division of Subsistence.

For purposes of subsistence shellfish management, the Chignik Finfish Management Area is within the ADF&G Alaska Peninsula–Aleutian Islands Area. The BOF identified positive subsistence uses of all shellfish stocks in the Alaska Peninsula–Aleutian Islands Area. There are no subsistence harvest assessment programs for these shellfish stocks in the Chignik Area. Table 7-7 lists the shellfish for which subsistence uses have been documented through systematic household interviews.

In early 2004, the Division of Subsistence and the Bristol Bay Native Association, in a project funded by the *Exxon Valdez* Oil Spill Trustee Council, conducted comprehensive household surveys in Chignik Bay, Chignik Lagoon, Chignik Lake, and Perryville that, among other things, collected updated harvest data for nonsalmon fishes and marine invertebrates. A fifth community, Ivanof Bay, was not included in the study because it had no permanent year-round population at the time. A summary of these findings appears in Fall (2006).

The reader should consult Morris (1987), Fall et al. (1995), Hutchinson-Scarbrough and Fall (1996), and ADF&G (2002) for more background on these subsistence fisheries for nonsalmon finfishes and for shellfish. For harvest estimates based on systematic household interviews, see the CSIS. Limited nonsalmon subsistence resource use and harvest information was observed and documented during the Division of Subsistence 2010–2013 Chignik Management Area Subsistence Salmon Ethnography study (Hutchinson-Scarbrough and Marchioni *In Prep*).

## DISCUSSION

Prior to 2002, the years before the Chignik cooperative commercial fishery, many families processed most of their spring salmon for subsistence uses just prior to the first commercial opening in early June. Salmon were caught in early June either by purse seine or beach seine. Many families from Chignik Lake and Perryville would occupy fish camps across Chignik Lagoon. Chignik Lagoon and Chignik Bay families would, for the most part, put up their early subsistence fish as a family effort prior to the start of the first commercial fishing opening. These early-run fish (sockeye salmon) are especially important to subsistence users because these fish are traditionally smoked, and it is necessary to cure these fish before flies hatch and deposit eggs on the fish, which typically occurs in mid- to late June. Traditionally, subsistence users could maximize their early season subsistence harvests because of large pulses of early-arriving fish. Area subsistence fishers have also reported that the early-run fish taste better and freeze or salt better if harvested early in the season. The second run (late run) of sockeye salmon was traditionally taken either in Chignik Lagoon, Chignik Lake, or near the mouth of the Clark River. Gillnets and beach seines were typically used to harvest late-run salmon in Chignik Lake (Hutchinson-Scarbrough and Fall 1996:49).

During the years of the cooperative fishery (2002–2005), some changes occurred within area subsistence fishing patterns. Because many of the permit holders for Chignik were also area families who relied on subsistence fishing to feed their families, they would often use their commercial fishing boats to fish prior to the commercial fishing season. During these years, ADF&G opened the cooperative commercial fishery in early June, when many participants would have been processing their subsistence fish, and the nature of the management of the cooperative fishery resulted in fewer fish passing in the lagoon but at a more steady rate rather than experiencing pulses of fish that historically arrived when the competitive-only fishery was in operation. The management of the cooperative fishery resulted in a decrease in efficiency and an increase in effort for harvesting subsistence salmon in Chignik Lagoon.

According to verbal testimony by some Chignik families to Division of Subsistence personnel, many families had to wait until later in the summer to subsistence fish, and then the flies created spoilage. Other area residents reported both positive and negative changes occurring with their subsistence harvests and cash economy as a result of the creation of the cooperative commercial fishery. The cooperative fishing years resulted in a regulatory change that removed the restrictions on subsistence fishing for commercial fishers who could fish for subsistence throughout the summer as long as it was not done at the same time as a commercial opening and a permit was obtained. Fishers without a commercial permit and who wished to subsistence fish as before could fish for subsistence at any time as long as they had a subsistence permit. In addition, there was a reported increase in the amount of fish removed from the cooperative boats for home pack that were given to area residents to supplement their subsistence harvests. At that time, subsistence users informed ADF&G that despite the adjustments to the CMA

subsistence fishery, which allowed for more opportunity for subsistence fishing, some were still having difficulty obtaining their subsistence salmon in 2004 and 2005.

In 2002 and 2004, the USFWS implanted radio transmitters in sockeye salmon in August and early September to determine when sockeye salmon targeted in the late season subsistence fishery passed the Chignik weir. The results of the 2002 studies are described in Anderson (2003). As stated in the regulations section of this chapter, in 2004 the BOF modified the commercial fisheries management plan for late-run sockeye salmon to allow more fish to pass into Chignik Lake in September, thus providing for subsistence harvests. Late-run sockeye salmon, which are dried, are harvested from Chignik Lake in the fall by many Chignik Area residents, including some Perryville families. In 2006, several residents, particularly from Chignik Lake, commented to ADF&G that despite the limits to the August commercial fishery, they still had difficulty acquiring their late-run salmon because they were not seeing as many fish as in prior years. They needed to fish more days to achieve harvest goals, or they harvested fewer late-run salmon. By 2006, after the the cooperative commercial fishery was abolished, area subsistence patterns generally returned to the historical patterns used prior to the cooperative fishery, but on a reduced level. In 2008, there was a decrease in participation in the Chignik subsistence fishery with 89 permits issued; 39 fewer permits issued than in 2007, and 32 fewer than the previous 10-year (1996–2007) average of 121. In 2010, however, there was an increase in permits with 124 issued, which was an increase from 2009 (95). In 2012, 106 permits were issued, which was nearly the same as the historical average of 104 permits, and slightly less than the recent 10-year average of 113 permits.

Numerous fish or summer camps located on the north side of Chignik Lagoon were abundantly utilized in the 1990s but were mostly abandoned by 2006. However, in 2007 through 2012, a few families that reside in Perryville continued to stay at their camps during the commercial fishing season. A Perryville family member who has maintained and continues to utilize one of these multi-generational camps indicated that these camps are summer homes that provide housing for the families when commercial fishing; however, subsistence salmon are also harvested and processed while occupying the camps (Hutchinson-Scarbrough and Marchioni *In prep*).

In 2010 and 2011, gillnets, and purse seines were used to catch subsistence salmon, primarily sockeye from both runs in Chignik Lagoon and the lower mouth of Chignik River. In Chignik River, Chignik Lake and tributaries to Chignik Lake (primarily Clark River), salmon, primarily sockeye from both early and late runs, were harvested using gillnets or beach seines. In addition, beach seines and handlines were used to harvest the late-run “red fish” (sockeye salmon that have entered fresh waters and started to spawn) and “spawned-outs” (spawning sockeye), primarily at Hatchery Beach on Chignik Lake, the mouth of Clark River, or in Clark River and Home Creek. Also in 2011, sockeye salmon were harvested by handline in Black Lake, but not in 2012. Late-run or spawning fish are typically preserved by drying in the wind on racks after harvest. This method is preferred because residents report they have less fat than early-run sockeye salmon. Chinook salmon were caught in Chignik Lagoon and the Chignik River using gillnets, seines, and rod and reel, or removed from commercial harvests and preserved by smoking or canning (Hutchinson-Scarbrough and Marchioni *In prep*).

Perryville subsistence patterns have not changed greatly from historical times, though fewer families are going to fish camps or summer homes located on the northern side of Chignik Lagoon. In 2011, 2012 and 2013, 6 of these camps were occupied by Perryville residents who utilize these camps during commercial fishing and for subsistence fishing for sockeye salmon. Fresh sockeye salmon are brought back to the village by commercial fishing families. Area streams and beaches are used extensively for the harvest of the local runs of coho, chum, and pink salmon, as well as the occasional sockeye salmon. Due to the fluctuations in river locations and stream flow, and fluctuations in salmon runs to these systems, Perryville subsistence fishers may have to use other streams and bays as far east of the village as Mitrofania Bay and as far west as Ivanof Bay to harvest their fish. Fish are smoked, dried, canned, salted, and frozen by Perryville residents. Some Perryville families have relatives in Chignik Lake and travel to

Chignik Lake in the fall to harvest late-run sockeye salmon for drying (Hutchinson-Scarbrough and Marchioni *In prep*).

Table 7-1.–Historical subsistence salmon harvests, Chignik Area, 1977–2013.

| Year | Permits | | Estimated salmon harvest | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Issued | Returned | Chinook | Sockeye | Coho | Chum | Pink | Total |
| 1977 | NA | NA | 50 | 9,700 | 2,400 | 600 | 1,800 | 14,550 |

*Source* ADF&G Division of Subsistence, ASFDB 2014 (ADF&G 2015); Quimby and Owen (1994) for 1976–1979 and 1987.

*Note* NA indicates data not available. Information regarding the number of permits issued and returned was collected; however, the records containing this information no longer exist. Harvest data for these years are also recorded in ADF&G Division of Commercial Fisheries and Division of Sport Fish area management reports.

a. From 1993–2008 and 2011, post-season household surveys were conducted to supplement harvest data collected through returned permits. Limited budgets prevented administering the surveys for 2009, 2010, 2012, and 2013 likely resulting in an underestimate of subsistence harvests since not all subsistence fishing households obtained a permit. To compensate for this underestimate, the average annual harvest for the period 1999–2008 and 2011 reported during post-season surveys was added to harvests from returned permits to estimate the total subsistence harvest for 2009, 2010, 2012, and 2013.

a. The Chignik Bay-Lagoon Subarea corresponds to the portion of the Central District and the Chignik Bay District, not including any of the Chignik River from the outlet of Chignik Lake ("FRI Point" to the River's outlet at Mensis Point in Chignik Lagoon). The Chignik Lake Subarea includes subsistence harvests in the Chignik River from Mensis Point in Chignik Lagoon up to Black Lake. The Perryville Subarea corresponds to the Perryville and Western districts, including Ivanof Bay, Mitrofania Bay, the Kametolook River and other streams near Perryville and Ivanof Bay. In recent years there have been no subsistence harvests reported for the Eastern District.

b. Harvest estimates are based on 2013 permit returns only. Of 86 permits issued for the Chignik Area, 63 permits were returned (73%).

# CHAPTER 8: ALASKA PENINSULA AREA

## BACKGROUND

The Alaska Peninsula Area includes all Pacific Ocean waters of Alaska on the north side of the Alaska Peninsula southwest of a line from Cape Menshikof to Cape Newenham and east of the longitude of Cape Sarichef Light and on the south side of the Alaska Peninsula from a line extending from Scotch Cap through the easternmost tip of Ugamak Island to a line extending 135 degrees southeast from Kupreanof Point (5 AAC 01.400). The communities of the Alaska Peninsula Area are Port Heiden (estimated population 118 in 2013), Nelson Lagoon (population 45), False Pass (population 40), Cold Bay (population 85), King Cove (population 934), and Sand Point (population 1,018).[1] Port Moller has no year-round population and is only seasonally occupied. Port Heiden is in the Lake and Peninsula Borough; the other communities are in the Aleutians East Borough (which also includes Akutan in the Aleutian Islands Area).

## REGULATIONS

A subsistence permit, which must be used to record daily harvests, is required for fishing in the Alaska Peninsula Area. There is an annual limit of 250 salmon per household. Legal gear includes seines and gillnets. In waters open to commercial fishing, set and drift gillnets may not exceed 50 fathoms in length. In most other areas, set gillnets may not exceed 100 fathoms and drift gillnets may not exceed 200 fathoms. Purse seines may not exceed 250 fathoms in length. Other standard permit conditions include prohibition of fishing within 300 ft of a dam, fish ladder, weir, culvert, or other artificial obstruction. The Alaska Administrative Code (5 AAC 01.423) includes special provisions regarding subsistence gear for other areas, including Mortensens Lagoon, the False Pass vicinity, and Bear and Sandy rivers. Salmon may be taken at any time, except in those districts and sections that are open to commercial salmon fishing, salmon may not be taken during the 24 hours before and 12 hours following a commercial salmon fishing period. A few small areas closed to subsistence salmon fishing are listed in 5 AAC 01.425.

Federal regulations governing subsistence salmon fishing in waters under the jurisdiction of the FSB are generally identical to the state regulations summarized above, with the exception that rod and reel, in addition to gillnet and seine, is legal subsistence gear under federal rules. There is no separate federal subsistence permit; a state permit is required for subsistence fishing under the federal regulations.

## HARVEST ASSESSMENT PROGRAM

The Division of Commercial Fisheries has issued subsistence permits for the Alaska Peninsula Area since 1979. Except for residents of Sand Point and Cold Bay, permits are mailed each year to fishers who returned their permits at the end of the previous fishing season. Sand Point and Cold Bay residents are issued permits upon request at the ADF&G offices in Sand Point and Cold Bay. Permits are also issued upon request at other ADF&G offices and by mail to people who telephone to request them. Regulations require that permits be returned to ADF&G by October 31. Reminder letters are sent around November 1 to people who have not yet returned their permits. If a person does not return the permit, his or her name is removed from the mailing list. Data from returned permits are tabulated by species and fishing area. Harvest data from returned permits are expanded by community of residence to estimate the harvest by all permit holders.

## SUBSISTENCE SALMON HARVESTS IN 2013

From 1985 through 2012, the number of subsistence salmon permits issued for the Alaska Peninsula Area averaged 191 per year (Table 8-1). The recent 5-year average (2008-2012) was 170 permits. In both 2012 and 2013, 172 subsistence salmon fishing permits were issued for the Alaska Peninsula Area. This compares to the 249 permits issued for the commercial salmon fishery for the Alaska Peninsula Area in 2013 (Poetter and Nichols 2014). The response rate for subsistence permits was 91% in 2013 (157 of 172 permits were returned). Of all subsistence permits issued, 144 (84%) were issued to residents of Alaska Peninsula Area communities, and 28 (16%) were issued to residents of other Alaska communities (Table 8-2). Most nonlocal residents fish at Mortensens Lagoon, primarily because of easy road access from the Cold Bay airport which provides economically feasible transportation options (Tschersich and Russ 2008).

The estimated subsistence salmon harvest in the Alaska Peninsula Area in 2013 was 11,353 fish. This is a decrease from the prior year (14,231 salmon in 2012) and less than the recent 5-year average (13,677) and 10-year average (14,206) (Table 8-1). The 2013 subsistence harvest was made up of 59% sockeye salmon, 20% coho salmon, 10% pink salmon, 10% chum salmon, and 2% Chinook salmon (Figure 8-1). Of the total harvest, the residents of Cold Bay harvested 5%, False Pass residents 6%, Sand Point residents 39%, Port Heiden residents 1%, Port Moller residents <1%, Nelson Lagoon residents 1%, and King Cove residents 39%. Other Alaska residents harvested 7% (Table 8-2; Figure 8-2). Following historical peak harvest levels recorded in 1997, existing data indicate a general decline in the Alaska Peninsula Area subsistence salmon harvest (Table 8-1).

Home-pack from commercial fisheries can also be an important source of personal use salmon. Vessels fishing in the commercial fisheries Southern Alaska Peninsula management area reported taking 1,672 pink salmon from their commercial harvest in 2013 (Matthew Keyse, ADF&G Area Management Biologist, Alaska Peninsula and Aleutian Islands, Personal Communication, April 15, 2015). No other species of salmon was reportedly taken for personal use in this area in 2013. Homepack is required to be reported on commercial harvest tickets, but they may not be complete.

In interviews with Division of Subsistence staff in 2000, fishery managers expressed the view that the subsistence permit program did not completely document all subsistence salmon harvesting activities because some fishers did not obtain permits (Fall and Shanks 2000:30). A comparison of permit and household interview data for 1992 for King Cove found that about 31% of interviewed households that reported subsistence fishing did not have permits (Fall, Mason, et al. 1993:58–62). The estimated total subsistence salmon harvest for the community based on the interviews was 7,036 (±1,773), compared to 5,856 based on permit returns (Fall, Mason, et al. 1993:58–62.). At Sand Point in the same year, 41% of interviewed households reported that they harvested salmon for subsistence but did not have permits. The estimated total subsistence salmon harvest for Sand Point based on the household interviews was 11,338 (±2,551), compared to 7,833 based on estimates using permit return information (Fall, Andersen, et al. 1993:61).

The subsistence permit program for the Alaska Peninsula Area does not account for salmon withheld from commercial catches for home uses. Fishery managers believe that this number is substantial, especially in years when commercial salmon prices are low. For 1992, it was estimated that 51% of the salmon harvested for home uses at King Cove (Fall, Mason, et al. 1993), and 45% at Sand Point (Fall, Andersen, et al. 1993), were removed from commercial harvests.

In 2002 and 2003, the Division of Subsistence conducted the Subsistence Fisheries Harvest Assessment and Traditional Ecological Knowledge (TEK), Lower Alaska Peninsula and Aleutian Islands project, funded in part by OSM under project number 02-032. The goals of the project were to generate harvest data for salmon to supplement estimates produced through the subsistence permit program and to collect TEK about fisheries resources. Among other findings, the research documented that King Cove households removed 2,304 salmon from their commercial harvests for home uses in 2003, representing

24% of the total salmon harvest for home uses in the community (Davis 2005:116). Another product was a searchable TEK database called “The View from the Beach.” For detailed study findings, consult Davis (2005).

## OTHER SUBSISTENCE FISHERIES

Subsistence Pacific halibut fishing harvest estimates for communities and tribes in the Alaska Peninsula Area are available for 2003–2012 (Fall and Koster 2014). Due to a lapse in funding, subsistence Pacific halibut fishing harvest estimates were not collected for 2013.

There are no other annual harvest assessment programs for the other finfish and shellfish subsistence fisheries of the Alaska Peninsula Area. The Division of Subsistence has conducted 1 round of systematic household harvest surveys in each of the area’s communities, except for Cold Bay. The findings of these surveys, including species used, percentage of households harvesting each species in the study year, and estimated harvest quantities for the study year, appear in the CSIS. Table 8-3 reports the percentage of households in the surveyed communities that used selected nonsalmon finfish species in the study year. Generally, Pacific cod, halibut, and Arctic char/Dolly Varden were the most frequently used by households in these communities.

Nonsalmon subsistence harvest data is also available for Nelson Lagoon, Port Heiden, and False Pass in 2009 (Reedy-Maschner and Maschner 2012). The per capita edible weight of nonsalmon fish reported for Nelson Lagoon in this study was 15.5 lb, for Port Heiden 13.7 lb, and for False Pass, 117.9 lb. The higher per capita harvests reported for False Pass represents a much greater harvest of Pacific halibut. Pacific halibut represented the highest per capita subsistence harvest among nonsalmon fish in each of these communities except Nelson Lagoon where it was surpassed by unknown trout. For more information, refer to Reedy-Maschner and Maschner (2012).

# CHAPTER 9: ALEUTIAN ISLANDS AREA

## INTRODUCTION

The Aleutian Islands Management Area includes all waters of Alaska in, and surrounding, the Aleutian Islands west of Cape Sarichef Light and west of a line extending from Scotch Cap through the easternmost tip of Ugamak Island, including the waters in and surrounding the Pribilof Islands (5 AAC 01.350). For subsistence purposes, the Aleutian Islands Area is divided into 6 management districts. From east to west, they are the Akutan District, Unalaska District, Umnak District, Pribilof Islands District, Atka–Amlia Islands District, and the Adak District (5 AAC 01.355). The major communities of the Aleutian Islands Area are Akutan, Unalaska–Dutch Harbor, Atka, Nikolski, and Adak. Akutan is part of the Aleutians East Borough; the other communities are part of the Aleutians West Census Area, but they are not within an organized borough.

According to the US Census, Akutan's population in 2010 totaled 1,027, of which only 90 people lived in a total of 40 households in the Native Village of Akutan, and the remaining 937 lived in group quarters at the adjacent Trident Seafoods processing plant. In 2013, the total Akutan population was estimated at 1,154; however, most of the people (1,066) were estimated as residing in group housing, and 88 resided in households. In 2010, the population of Unalaska–Dutch Harbor was 4,376 with 2,277 residents residing in a total of 927 households and the remainder (2,099) in group quarters (primarily seafood industry workers housing). In 2013, the estimated population of Unalaska–Dutch Harbor was 4,735 with 2,417 residing in households and 2,318 in group quarters. In Nikolski, the population in 2010 was 18 residing in a total of 13 housholds; and in 2013, the estimated population was 18. Atka in 2010 had a population of 61 residing in a total of 24 households; and the estimated population in 2013 totaled 67. Adak's 2010 census population totaled 326 people which 109 lived in a total of 44 households and 217 in group quarters; and in 2013, the estimated population was 282 total people, 182 of which were estimated to be in group quarters. [1]

Two communities are within the Pribilof Island District. St. Paul in 2010 had a population of 479 with 455 residing in a total of 162 households and 24 residing in group quarters; and in 2013, the population was estimated at 453 with 441 residing in households and 12 people residing in group quarters. St. George's 2010 population was 102, with 98 residing in a total of 42 households, and 4 residing in group quarters; and the 2013 population estimate was 97 people; 4 of which resided in group quarters.[2][3]

The Alaska Board of Fisheries found that halibut and all other finfish in the Aleutian Islands Area and the waters surrounding the Pribilof Islands are customarily and traditionally taken or used for subsistence. The board found that (1) 13,500–23,000 salmon and (2) 200,000–330,000 usable pounds of finfish other than salmon are reasonably necessary for subsistence uses in the Aleutian Islands area (5AAC01.366).[4] Subsistence salmon harvests are monitored annually only in the Unalaska and the Adak districts, where a permit is required for harvest. A permit is not required for subsistence salmon fishing in the waters fished by the communities of Akutan, Atka, Nikolski, or Adak; therefore, subsistence salmon harvests are not systematically monitored in these communities. Harvest estimates for Akutan are based upon data in Davis (2005), from household surveys conducted in 2009 for the 2008 harvest year, and from household surveys conducted in 2010 for the 2009 study year (Reedy-Maschner and Maschner 2012). Estimates for

3. U.S. Census Bureau, Washington D.C. n.d. "American FactFinder." U.S. Department of Commerce. Accessed April, 2015. http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml
4. Alaska Department of Fish and Game. 2013–2014 Subsistence and personal use statewide fisheries regulations. Alaska Department of Fish and Game, Juneau.

Atka and Nikolski are based upon data in Davis (2005). There are no native populations of salmon in the Pribilof Islands, and therefore there are no local subsistence salmon fisheries available for the communities of St. Paul and St. George.

Home-pack from commercial fisheries can also be an important source of personal use salmon in some areas. Despite this fact, vessels fishing in the commercial fisheries Aleutian Islands management area did not report taking salmon out of their commercial harvest in 2013 (Matthew Keyse, ADF&G Area Management Biologist, Alaska Peninsula and Aleutian Islands, Personal Communication, April 15, 2015). Although it is required that homepack be reported on commercial harvest tickets, the reports may not be complete.

## SALMON HARVESTS IN THE UNALASKA DISTRICT

The Unalaska District includes all waters west of Akutan Pass up to, and including, Umnak Pass (5 AAC 12.200 (b)).

### Salmon Harvest Regulations

A permit is required for subsistence salmon fishing in the Unalaska District. Fishers must record their daily harvests on the permit and return it to ADF&G by October 31. Permit holders may harvest up to 25 salmon per permit plus an additional 25 salmon for each member of the same household who is listed on the permit. A permit holder may obtain an additional permit from the department if more fish are needed. A record of subsistence-caught fish must be recorded on the reverse side of the permit and the permit must be returned to the department by October 31, even if no salmon were harvested (5 AAC 01.380).

Other standard permit conditions include prohibition of fishing within 300 ft of a dam, fish ladder, weir, culvert, or other artificial obstruction. Salmon may be taken from 6:00 AM until 9:00 PM beginning January 1 through December 31, except that from June 1 through September 15, a salmon seine vessel may not be used to take salmon for subsistence purposes 24 hours before, during, or 24 hours after an open commercial fishing period within a 50-mi radius of the area open to commercial fishing. Salmon may be taken by seine or gillnet, but from June 1 through September 15, a purse seine vessel may be used to take subsistence salmon only with a gillnet. In the Unalaska District, subsistence gillnets must be attended at all times while fishing. (5 AAC 01.360–5 AAC 01.370). Waters within the Unalaska District that are closed to subsistence fishing for salmon are defined in 5 AAC 01.375.

### Salmon Harvest Assessment Program

The Division of Commercial Fisheries has issued subsistence salmon harvest permits for the Unalaska District since 1979. Permits are only issued in person at the ADF&G Dutch Harbor office. Unalaska District permits are required by regulation to be returned by October 31; they may be retuned in person or mailed to the ADF&G Dutch Harbor office. Reminder letters are sent on approximately November 1 to all permit holders who have not returned their permits. Data from returned permits are tabulated by species and fishing area. Harvest estimates are calculated by expanding reported harvest numbers from successfully and unsuccessfully fished permits to represent fish taken by all permit holders, including those who did not return their permits (Wilburn and Nichols 2013). Federal subsistence fisheries are authorized for permament residents residing in the Aleutian Islands Area; however they are managed consistently with the state fisheries in the region. [5]

5. Additional information about the federal subsistence fishery is available by contacting the United States Fish and Wildlife Service, Office of Subsistence Management in Anchorage, AK (http://www.doi.gov/subsistence/index.cfm).

### Subsistence Salmon Harvests in 2013

In 2013, 254 subsistence salmon permits were issued for the Unalaska District which was more than the previous year, 2012, when 211 were issued, more than the recent 5-year (2008–2012) average of 214 permits (and 10-year (2003–2012) average of 210 permits issued (Table 9-1). This number was also higher than the historical annual average (1985–2012) of 170 permits. Harvest numbers are recorded on the permit and returned at the end of the harvest season to ADF&G. In 2013, the return rate for the Unalaska District was 78%, with 197 permits returned out of 254 permits issued. Dutch Harbor and Unalaska residents accounted for 230, or 91%, of all permits issued in the Unalaska District, and returned 177 permits out of 197 permits (90%) (Table 9-2).

The estimated subsistence harvest of salmon in the Unalaska District in 2013 was 4,840 fish, which was was 950 salmon less than the previous year (5,790), and less than the recent 5-year average (4,864 fish) and equal to the10-year average (4,840 fish) for the district (Table 9-1). The composition of the 2013 subsistence salmon harvest was sockeye (88%, higher than 2012 (86%), coho (4%, down from 7% in 2012), pink (6%, the same as in 2012),), chum (1%), and Chinook (<1%) salmon (Figure 9-1). The primary subsistence salmon fishing locations used in the Unalaska District occurred primarily in Reese Bay where sockeye salmon are targeted as they are migrating to McLees Lake (Hartill and Keyse 2010).

In interviews with Division of Subsistence personnel in 2000, ADF&G fishery managers expressed the view that the permit program captured most subsistence salmon harvests occurring in the Unalaska District (Fall and Shanks 2000). In their view, most subsistence fishers likely obtained permits, perhaps due to the presence of Alaska Wildlife Troopers from the Alaska Department of Public Safety as well as a population that is self-enforcing (likely to report violators). Fishery managers in the Unalaska District believe that few commercially caught salmon are retained for home uses in the Aleutian Islands Area since most commercial fishing activities in the area target shellfish and groundfish rather than salmon. A 1994 survey of randomly selected Unalaska households conducted by the Division of Subsistence supports this view: it found that 4% of all salmon harvested for home uses were removed from commercial catches, 62% were harvested with noncommercial nets, and 34% with rod and reel under sport fishing regulations (CSIS).

## SALMON HARVESTS IN THE ADAK DISTRICT

The Adak District of the Aleutian Islands Area consists of waters west of Atka Pass at 175°23.00’ west longitude to the terminus of the Aleutian Islands. Adak Island hosted a U.S. Navy base and military community (population of 4,633 in 1990) that was phased out between 1993 and 1996. With the Navy base closure complete, the population was estimated at 0 in 1997; however, for several years following the base closure, the Aleut Corporation worked with the Department of Interior and Department of the Navy to lease the base facilities and ultimately secure a land transfer to the corporation in 2004, with the intention of repurposing and privatizing the facility’s infrastructure to support the local fisheries industry with processing, refueling, and housing services. During the lease period, the Aleut Corporation processed its first commercially caught fish in 1998 and has continued working with the Alaska seafood industry to further develop and maintain Adak as a commercial fish processing location. In 2000, the Alaska Boundary Commission approved Adak’s application to become a second-class city. In 2013, Aleut Enterprises and the Aleut Corporation owned and operated a seafood processing facility, and a few Adak residents held commercial fishing permits. In addition, Adak provides a fueling port and crew transfer facility for foreign fishing fleets.[6,7] Adak’s estimated population was 316 in 2000[8] and 331 in 2010, with

6. Gen. Hansford T. Johnson, USAF. 2002. Statement of H.T. Johnson Assistant Secretary of the Navy (Installations and Environment) Before the Subcommittee on Public Lands and Forests of the Senate Committee on Energy and Natural Resources To Ratify an Agreement Between the Aleut Corporation And the United States of America. 21 students attending the Adak school. The estimated population for Adak in 2013 was 282 of which 182 resided in group quarters. [9]

### Salmon Harvest Regulations

Prior to 1988, the noncommercial salmon net fishery at Adak was classified as a subsistence fishery, then a personal use fishery in 1988, followed by a return to a subsistence classification in 1998.

Subsistence regulations in place since 2001 require that fishers obtain a permit from ADF&G. Fishers must record their daily harvests on the permit, and return it to ADF&G by October 31. Permit holders may harvest up to 25 salmon per permit, plus an additional 25 salmon for each household member listed on the permit. Other standard permit conditions include prohibition of fishing within 300 ft of a dam, fish ladder, weir, culvert, or other artificial obstruction. Also, as specified in 5 AAC 01.380 (b)(2), "a permit holder may obtain an additional permit from the department to harvest more salmon." Salmon may be taken at any time. All salt waters within 100 yards of a stream terminus, as well as all fresh waters of and around Adak Island and Kagalaska Island, are closed to subsistence fishing for salmon (5 AAC 01.375 (6)).

### Salmon Harvest Assessment Program

Subsistence salmon permits are issued by the ADF&G Cold Bay office and are faxed upon request to Adak residents. Permits must be returned by mail or fax to the ADF&G Cold Bay office by October 31, after which reminder letters are sent to those who have yet to report their harvests. ADF&G fishery managers believe that the program provides reliable data on subsistence salmon fishing effort and harvests at Adak (Fall and Shanks 2000).

### Subsistence Salmon Harvests in 2013, Adak District

Only 6 subsistence salmon permits were issued for the Adak District in 2013. This was more than the 5-year (3) and 10-year (4) averages, but less than the historical 1988–2012 average (16) (Table 9-3). In 2013, all permits issued were to residents of Adak (Table 9-4). The total estimated harvest in 2013 was 122 salmon, comprising 30 sockeye salmon (25%), 12 coho salmon (10%), and 80 pink salmon (66%) (Table 9-3). The 2013 estimated harvest based on permits issued and retuned was more than any recent year between 2009 and 2012 when fewer than 3 permits were issued annually, but much less than in 2008 when 10 permits were issued with an estimated harvest of 400 salmon. The recent 5-year average of total salmon harvests (2008–2012) was 100 salmon, most of which were sockeye (97), followed by pink salmon (3). For the period 1988–1993, during the Navy's occupation of their base at Adak, an average of 49 personal use permits were issued and the average annual harvest was 611 salmon, with an average of 529 sockeye, 62 pink, 20 coho and 0 Chinook harvested (Table 9-3).

## SALMON HARVESTS AT AKUTAN, NIKOLSKI, AND ATKA

Permits are not required for subsistence salmon harvests in the Akutan, Umnak, and Atka–Amlia islands districts, and there are no annual harvest assessment programs in place. In these districts, no more than 250 salmon may be taken annually for subsistence purposes (5 AAC 01.380).

The Division of Subsistence conducted postseason household interviews in Akutan (Akutan District) and Nikolski (Umnak District) pertaining to 1991 subsistence harvests (all resources); again in Akutan pertaining to 2008 subsistence harvests (all resources); and in Atka (Atka–Amlia Islands District) pertaining to harvests in 1992 (salmon only), and 1994 (all resources). Salmon harvest data were also collected for Akutan and Nikolski (2002 and 2003 harvests) and Atka (2003 harvests) as part of the

project reported in Davis (2005). In most years, subsistence harvests of salmon in Akutan, Nikolski, and Atka are primarily composed of sockeye salmon, but coho and pink salmon also account for a relatively large proportion of yearly harvests (Table 9-5). Subsistence salmon harvests in Akutan totaled 3,268 fish in 1991, decreasing to 1,070 fish in 2002 and 1,675 fish in 2003. In 2008, Akutan harvests totaled nearly the same as in 1991 with a total of 3,363 salmon; with sockeye (1,489) and pink salmon (1,366) harvests being near equivalent. The Reedy-Maschner and Machner (2012) report indicates per capita usable weight of subsistence harvested salmon for Akutan in 2009 (73.9 lb) but it does not provide the total number of fish in total or by species. Considering the per capita harvest reported in 2009, Pink salmon was greatest (35.4 lb), followed by Sockeye salmon (27.5 lb; Reedy-Maschner and Machner 2012). Yearly salmon harvests in Nikolski also presented an apparent decreasing pattern, with 1,902 fish caught in 1991 and 604 fish in 2003; further data collection and analysis is necessary to confirm the trend. In Atka, the yearly salmon harvest varied between 1,454 and 2,387 in the 3 years for which information is available (Table 9-5).

## OTHER SUBSISTENCE FISHERIES IN THE ALEUTIAN ISLANDS AREA

### Finfishes

Harvest estimates of subsistence halibut for the Aleutian Islands Area are available for 2012 (Fall and Koster 2014). Due to a lapse in funding, harvest estimates of subsistence salmon are not available for 2013.

There are no annual harvest assessment programs for other subsistence finfish fisheries of the Aleutian Islands Area. Permits are required for the taking of rainbow/steelhead trout and Arctic char/Dolly Varden, but no harvest reporting program is in place. Fish other than salmon may be taken by gear specified in 5 AAC 01.010, except that under state regulations, halibut may be taken only by a single handheld line with no more than 2 hooks attached, while federal rules allow up to 30 hooks using a longline (skate). The Division of Subsistence has conducted systematic household surveys pertaining to a single year's harvests in Akutan (1991; 2008), Atka (1994), Nikolski (1991), Saint George (1994), Saint Paul (1994), and Unalaska–Dutch Harbor (1994). Results, including harvest estimates for finfishes, are available in the CSIS.

Nonsalmon subsistence harvest data is also available for Akutan in 2009 (Reedy-Maschner and Maschner 2012). The per capita edible weight of nonsalmon fish reported for Akutan in this study was 131.7 lb. This harvest was comprised primarily of Pacific halibut (105.1 lb per capita), followed by Pacific cod (19.4 lb per capita), and Dolly Varden (3.7 lb. per capita). For more information, refer to Reedy-Maschner and Maschner (2012).

### Shellfish

Permits for the taking of shellfish for subsistence purposes are required only for king and Tanner crabs in that portion of the Alaska Peninsula–Aleutian Islands Area west of Scotch Cap Light and east of 168° west longitude. Estimates of subsistence harvests of all marine invertebrates for single study years, based on systematic household surveys, are available in the CSIS.

# CHAPTER 10: KODIAK AREA

## INTRODUCTION

The Kodiak Area encompasses the waters of the Gulf of Alaska surrounding the Kodiak Archipelago and those waters along that portion of the Alaska Peninsula that drains into Shelikof Strait (Figure 10-1). The portion of the Kodiak Island Borough's population living along the island's road system is the largest rural community in Alaska (as defined by the Federal Subsistence Board [FSB]) and the largest community outside the nonsubsistence areas defined by the Alaska Joint Board (Figure 10-1). The population of the Kodiak Island Borough according to the State of Alaska Department of Labor and Workforce Development (13,815 in 2013) comprises all individuals residing on Kodiak and nearby islands; however, this population is often distinguished by which communities have access to the road system. Communities along the Kodiak Island road system include Kodiak City (6,331), the U.S. Coast Guard base (1,199), Womens Bay (783), Chiniak (48), and the remainder of the road-accessible Kodiak Island Borough (this includes all residents of Kodiak Island who are on the road system but are not identified within the population of a census designated place [CDP] or city) (4,598). For the purposes of this report we are not including Chiniak as part of the Kodiak Road system because the community uses its own postal code, and residents consider themselves distinct from Kodiak City. However, there is a road that leads from Kodiak City to Chiniak. Communities within the Kodiak Island Borough that are located outside the range of the road system include Akhiok (85), Aleneva CDP (44), Karluk (43), Larsen Bay (88), Old Harbor (224), Ouzinkie (184), and Port Lions (188).[1]

## SALMON HARVEST IN THE KODIAK AREA

### Salmon Harvest Regulations

Permits have been required to harvest salmon for subsistence purposes in the Kodiak Area since 1962. Since 1990, all Alaska state residents have been eligible to participate in subsistence salmon fishing in the Kodiak Area under state regulations. In 2013, legal gear for subsistence salmon fishing under state regulations included gillnets (maximum length 50 fathoms) and seines. Fishers are required to physically attend their net while fishing and should always have a valid subsistence salmon permit with them while fishing for salmon; they should also record the numbers of all fish harvested on the permit before concealing the fish from plain view or transporting them from the harvest area. Generally, fishing is open year-round from 6:00 AM to 9:00 PM daily. From June 1 through September 15, commercial purse seine vessels may be used for subsistence fishing only before June 1 and after September 15. Purse seines cannot be used for subsistence salmon fishing 24 hours before, during, and 24 hours after any period open for commercial salmon fishing. Only gillnets can be operated for subsistence purposes from purse seine vessels between the dates of June 1 and September 15, and only when no other salmon fishing gear is on board. Permits allow individual fishers to harvest 25 salmon for their own use plus 25 additional salmon for each member of the permit holder's household. An additional permit can be obtained if the fisher could demonstrate a need for more fish. A list of waters closed to subsistence fishing within the Kodiak Area appears in 5 AAC 01.525 and 5 AAC 01.530.

In 2013, federal regulations governing subsistence salmon fishing in waters of the Kodiak Area under jurisdiction of the FSB were generally identical to the state regulations summarized above, except that rod and reel (in addition to gillnets and seines) was legal subsistence gear under federal rules. Another

1. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed July 2014. http://labor.alaska.gov/research/pop/popest.htm

difference was that federal regulations allowed subsistence salmon fishing 24 hours per day, while state regulations limited subsistence fishing to the hours of 6:00 AM to 9:00 PM daily[2].

## Salmon Harvest Assessment Program

Staff in the Division of Commercial Fisheries' Kodiak office manage the subsistence salmon harvest assessment program for the Kodiak Area. Permits are mailed each year to people who turned in their permits at the end of the previous fishing season. People may request subsistence permits by mail or in person at the Kodiak ADF&G office. In June 2001, staff from the Division of Commercial Fisheries and the Division of Subsistence visited 6 communities off the road system in the Kodiak Island Borough (Akhiok, Karluk, Larsen Bay, Old Harbor, Ouzinkie, and Port Lions) to implement an area permit vendor program. A resident in each community was trained to issue subsistence fishing permits. Outreach activities were conducted in each community to encourage subsistence fishers to obtain permits, record their harvests, and return the permits at the end of the season. Research conducted in 2013 by Division of Subsistence researchers showed that outreach in regards to subsistence fishing regulations and permiting is again needed in the smaller communities on Kodiak Island. Researchers witnessed a great deal of confusion surrounding subsistence regulations and the permit system. Area managers were contacted so researchers could provide accurate answers to subsistence fishers' questions. Subsistence fishers mail permits with their harvest record to ADF&G at the end of the season or return them in person at the Kodiak ADF&G office. ADF&G sends reminder letters in February to permit holders who have not returned their permits.

## Subsistence Salmon Harvests in 2013

In the Kodiak Area, ADF&G sends permits to every permit holder who returned a permit in the previous year. The U.S. Postal Service returns a number of permits to ADF&G marked "undeliverable." No record is maintained regarding the number of "undeliverable" permits—as a result, the actual number of permits issued remains unknown. For this reason, harvest reports have not been expanded for this area since 1999 (Table 10-1). Results of the harvest monitoring program therefore reflect only the reported harvests of subsistence fishers who returned permits.

In 2013, 1,688 subsistence permits with harvest information were returned to ADF&G (tables 10-1 and 10-2). Of these, 1,420 (84%) were returned by residents of Kodiak Island Borough, 262 (16%) were returned by residents of other Alaska communities, and 6 (<1%) had been issued to Alaska residents who were serving in the military outside of the state. Following a well-established trend, permit holders with addresses in Kodiak Island Borough accounted for the majority (84%) of all permits returned for 2013 (Table 10-2).

The total reported subsistence salmon harvest for the Kodiak Area in 2013 was 31,405 fish, which is higher than the recent 5-year (2008–2012) average of 29,738 salmon, but lower than the 10-year (2003-2012) average of 32,840 salmon (Table 10-1). Of the total harvest, 30,200 salmon (96%) were harvested by residents of Kodiak Island Borough communities and 1,189 salmon (4%) were harvested by permit holders in other Alaska communities (Table 10-2). Of the 30,200 salmon harvested by Kodiak Island Borough residents, 24,962 fish (80%) were taken by residents living along the Kodiak Island road system (figures 10-1 and 10-2). The Kodiak Island road system includes Kodiak City, the U.S. Coast Guard base, Womens Bay, and the remaining residents who live along the Kodiak Island road system but who are not identified within the population of a CDP or city. This is consistent with the pattern between 2000 and 20012 when 72% to 83% of all salmon harvested by Kodiak Island Borough residents for subsistence purposes was taken by residents of Kodiak City and areas along the road system. Comparatively, the 6 villages and other populated remote locations that do not have access to the road system surrounding Kodiak City, together with Chiniak, harvested 5,238 salmon in 2013 (Table 10-2).

2. USFWS began issuing a separate subsistence salmon fishing permit in 2013. ADF&G will attempt to obtain harvest resultsfor inclusion in future reports.

In 2013, the Kodiak Area subsistence salmon harvest was composed of 88% sockeye salmon, 8% coho salmon, 3% pink salmon, 1% chum salmon, and <1% Chinook salmon (Figure 10-3). The commercial harvest retained for home use was different in 2013 in terms of the composition of the harvest. As shown in Figure 10-4, in 2013, 11,576 salmon, including 1,164 coho (10%), 5,721 pink (50%), 3,032 sockeye (26%), 592 Chinook (5%), and 1,067 chum salmon (9%), were retained from commercial harvests for home use (Jackson and Keyse 2013:13). The total numbers of pink and Chinook salmon retained from commercial harvests for personal use in 2013 were both 4 times as large as they were in 2012. The 2013 commercial retention of chum for personal use increased 34 times from 2012. The commercial retention of both sockeye and coho salmon decreased significantly from 2012 to 2013 (Jackson and Keyse 2013:13).

In 2001, interviews were conducted with Division of Subsistence staff and fishery managers within the Division of Commercial Fisheries. During interviews, fishery managers expressed uncertainty regarding the accuracy of subsistence salmon harvest data collected through the Kodiak Area permit program. ADF&G staff suspected that a substantial amount of subsistence harvests occurred without permits, especially in areas off the Kodiak Island road system. Subsistence salmon harvest estimates for the Kodiak Area based on household harvest surveys and reported in the CSIS were substantially higher than harvests reported in the FMRs. Delivery of permits to subsistence fishers living in communities outside of the road system, including Akhiok, Karluk, Larsen Bay, Old Harbor, Ouzinkie, and Port Lions, has proven problematic in the past. As mentioned above, an outreach effort and an area permit vendor program were implemented in 2001 to address this issue. These actions appeared to result in increased participation in the permit program in these 6 communities. A total of 100 permits were returned in 2000; from 2001 through 2006 between 189 and 143 permits were returned (Table 10-3). Accordingly, the yearly reported subsistence salmon harvest also fluctuated between 2000 and 2006 with the lowest number harvested being 6,299 fish in 2000 and the highest number being 10,172 fish in 2005. The most recent years of 2010–2013 have marked the lowest reported salmon harvests, the lowest being 5,138 in 2007 and the highest being 5,896 in 2010. In 2013, both the number of permits returned by the 6 villages, together with Chiniak, (122 permits) and the number of harvested salmon reported (5,238 fish) were the closest to data for 2000, which was prior to the implementation of the local permit vendor program and the outreach effort (Table 10-3). Due to lack of funding, in 2013 a limited local vendor program was in place only in Ouzinkie, Larsen Bay, and Port Lions (personal communication, Amanda Dorner, Division of Commercial Fisheries, Kodiak). Likewise, no outreach efforts occurred in the small communities on Kodiak Island in 2013. Additional research and outreach are needed to assess the most recent harvest data. In 2013, the Division of Subsistence conducted subsistence salmon harvest surveys with residents of Larsen Bay, Old Harbor, and Kodiak City and communities along the surrounding road system to address this need for current data and community outreach. These data are currently in the analysis stage with the Division of Subsistence Information Management team, and a final report is expected to be published in 2015.

Household surveys (with results reported in the CSIS) have documented noncommercial salmon harvests with rod and reel gear, which is legal subsistence gear under federal subsistence regulations but not under state regulations. Household surveys also document the number of salmon removed from commercial harvests for personal use. Information on these 2 types of harvests, not documented by the permit program, is needed for a better understanding of the household salmon harvest in the Kodiak Area. This need was addressed by Division of Subsistence researchers when administering 2013 subsistence salmon harvest surveys.

In early 2004, the Division of Subsistence and the Kodiak Area Native Association (KANA) conducted comprehensive household surveys in Akhiok, Larsen Bay, Old Harbor, Ouzinkie, and Port Lions in the context of a project funded by the *Exxon Valdez* Oil Spill Trustee Council. Among other objectives, this project provided updated harvest data for salmon, nonsalmon finfishes, and marine invertebrates (Fall 2006).

In spring 2013, the Division of Subsistence conducted household harvest surveys in the communities of Kodiak City (along the road system), Old Harbor and Larsen Bay. The purpose of this project is to update the existing subsistence salmon harvest data for these communities. The project is currently in the data analysis phase.

## OTHER SUBSISTENCE FISHERIES IN THE KODIAK AREA

### Finfishes

Federal Pacific halibut subsistence harvest data are currently available for communities and tribes in the Kodiak Area from 2003–2012 (Fall and Koster 2014). Due to a lapse in funding, Pacific halibut subsistence harvest estimates were not collected for 2013.

There are no annual harvest assessment programs for other subsistence finfish fisheries in the Kodiak Area. Harvest estimates based on comprehensive household surveys conducted by the Division of Subsistence are available in the CSIS for freshwater and marine species spanning multiple years for each Kodiak Island Borough community. Fish harvested in the largest quantities and used by the majority of households include Pacific cod, lingcod *Ophiodon elongatus*, various species of flounders, Pacific halibut, rockfishes, and Arctic char/Dolly Varden.

### Shellfish

Subsistence permits are required for the harvest of king, Tanner, and Dungeness crabs in the Kodiak Area (5 AAC 02.410). Harvesters only need one permit for both salmon and shellfish; the shellfish harvest is recorded on the back of the salmon permit. Regulations establish sex, size, and bag and possession limits for these species of crabs. Only male crabs may be taken. Other marine invertebrates used for subsistence purposes in the Kodiak Area include clams, cockles, mussels, chitons, octopuses, sea urchins, and more.

Table 10-1.–Historical subsistence salmon harvests, Kodiak Area, 1986–2013.

| Year | Permits Issued | Returned | Reported salmon harvest[a] Chinook | Sockeye | Coho | Chum | Pink | Total |

*Source* ADF&G Division of Subsistence, ASFDB 2014 (ADF&G 2015).

ADF&G sends permits to every permit holder who returned a permit in the previous year. The U.S. Postal Service returns a number of permits to ADF&G marked “undeliverable”. No record is maintained regarding the number of “undeliverable” permits. As a result the actual number of permits issued remains unknown (ND). For this reason, harvest reports have not been expanded.

# CHAPTER 11: COOK INLET AREA

## INTRODUCTION

As shown in Figure 11-1, most of the waters of the Cook Inlet Management Area are within the Anchorage–Matsu–Kenai Nonsubsistence Area as established by the Joint Board [5 AAC 99.015 (3)]. Because subsistence fisheries are not permitted within nonsubsistence areas, noncommercial harvesting opportunities occur under sport, personal use, and educational fishing regulations (as well as limited opportunity under federal subsistence regulations). Commercial harvesters may retain finfish from lawfully taken commercial catch for home use ("home pack"). These fish are required to be reported on the commercial fish ticket, not on the subsistence salmon permit or personal use permit. In some parts of Alaska, in addition to gear authorized under subsistence fishing regulations, subsistence users report that substantial numbers of fish for home uses are taken with rod and reel (Fall, Turek, et al. 2009), which, in this area, is allowable gear under sport fishing regulations. Harvest summaries for the personal use, sport, educational, and commercial fisheries of the Upper Cook Inlet (UCI) Management Area can be found in annual management reports prepared by the ADF&G divisions of Sport Fish and Commercial Fisheries. A summary of the personal use salmon fisheries of the Cook Inlet Area follows the discussion of Cook Inlet subsistence fisheries.

Waters outside the nonsubsistence area include the Tyonek Subdistrict; the western portion of the Susitna River drainage; waters north of Point Bede that are west of a line from the easternmost point of Jakolof Bay and north of the westernmost point of Hesketh Island, including Jakolof Bay, and that are south of a line west of Hesketh Island; and those waters south of Point Bede which are west of the easternmost point of Rocky Bay, in Lower Cook Inlet.

Communities within the areas excluded from the nonsubsistence area include Skwentna (population 33 in 2013), Tyonek (population 178), Beluga (population 16), Seldovia (population 395 in the city and village CDP), Port Graham (population 151), and Nanwalek (formerly called English Bay, population 285). The population of the entire Cook Inlet area in 2013 was 453,587, including the Municipality of Anchorage (population 300,780), the Kenai Peninsula Borough (56,813), and the Matanuska-Susitna Borough (95,994). This represented 62% of the state's total population in 2013.[1]

## PORT GRAHAM AND KOYUKTOLIK SUBDISTRICTS

### History and Regulations

Subsistence regulations for this subsistence setnet fishery were first established by the BOF in 1980. The fishery is located along the southern shore of outer Kachemak Bay in the Port Graham and Koyuktolik subdistricts of the Southern District, and, beginning in 2002, the Port Chatham and Wind Bay subdistricts. Two predominately Alaska Native communities, Nanwalek and Port Graham, are located in the Port Graham Subdistrict. For detailed description of this subsistence fishery and other subsistence harvests and uses in Nanwalek and Port Graham, see Stanek (1985).

The fishery is open in the Port Graham and Koyuktolik subdistricts from April 1 through September 30 and in the Port Chatham and Windy Bay subdistricts from April 1 through August 1, from 10:00 PM Thursday to 10:00 AM Wednesday. The area open for the subsistence setnet fishery includes the entire shoreline of the subdistrict to a regulatory marker near the head of Port Graham Bay. There are no household bag or possession limits. The 3 primary species harvested are sockeye, pink, and coho salmon. The gear allowed includes set gillnets no longer than 35 fathoms, no deeper than 45 meshes, and no larger than a 6-in stretched mesh. Returns of sockeye salmon, which are a majority of the harvest in the

1. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed May 2015. http://labor.alaska.gov/research/pop/popest.htm

subsistence fishery, have been poor for the past 20 years. However, in 2011 the return of sockeye salmon counted at the English Bay weir continued to surpass the inriver goal (Hollowell et al. 2012:5). In 2012, the return and harvest rates dropped again, with 961 sockeye salmon reported harvested by permit holders. Sockeye returns were much greater in 2013 with 4,888 sockeye salmon reported harvested.

## Harvest Assessment Methods

In the past, the Division of Subsistence issued household permits through cooperative agreements with the Port Graham and Nanwalek village councils. However, in 2012, responsibility for the distribution, collection, and summation of subsistence permits for the communities of Seldovia, Port Graham, and Nanwalek was transferred from the Division of Subsistence to the Division of Commercial Fisheries, Homer Office. When permits are issued, a separate monthly harvest calendar is also issued for recording daily household harvests. Home use salmon harvests by the 2 communities occur with the use of setnets and rod and reel gear. While the recording of harvests in the setnet fishery is mandatory, it is not in the rod and reel fishery. Therefore, fishers are asked to voluntarily record their rod and reel harvests on their harvest permits. In order to accommodate the recording of harvests in both fisheries, the recording device has 2 pages, 1 for each gear type, and is issued separately from the permit. Area assistants hired by each village council collect the calendars periodically throughout the season. Arctic char/Dolly Varden harvests are also recorded on the calendars.

Sockeye salmon returns to the English Bay lakes were severely depressed for much of the late 1980s and early 1990s, with runs failing to achieve minimum escapement goals for 9 consecutive years between 1985 and 1993. Returns in the late 1990s were enhanced as a result of a rehabilitation enhancement project initiated by ADF&G and subsequently run by the Nanwalek Salmon Enhancement Project in association with the Chugach Regional Resources Commission (CRRC) and the village of Nanwalek (Hammarstrom and Dickson 2006:62). Inseason escapement monitoring has taken place since 1994, with openings and closures in the subsistence and commercial fisheries controlled by emergency order. Inconsistent runs in recent years have been the result of disease outbreaks in the lake-rearing portion of the program and erratic adult behavior that caused difficulty in capturing broodstock (Hammarstrom and Dickson 2006:41). A newer hatchery at Port Graham, run by the Port Graham Hatchery Corporation, contributed 6% to the subsistence harvest in Lower Cook Inlet (Hammarstrom and Ford 2011:2) and in 2010 released more than 200,000 sockeye salmon fry into the English Bay Lakes system (Hammarstrom and Ford 2011:6).

## Harvest Estimates for 2013

In 2012, responsibility for the distribution, collection, and summarizing of subsistence permits for the communities of Seldovia, Port Graham, and Nanwalek were transferred from the Division of Subsistence to the Division of Commercial Fisheries, Homer Office. The change in administration authority included some change in methodology for Port Graham and Nanwalek; the Division of Subsistence contracted local research assistants in the villages to ensure distribution and collection of permits. This approach was dropped by Commercial Fisheries and instead the permits were sent to the IRA councils for distribution.

In 2013, estimated salmon harvests for home uses in the Port Graham and Koyuktolik subdistricts totaled 8,897 salmon, including both subsistence setnet and reported rod and reel harvests (Table 11-1). The 2013 harvest was significantly higher than the historical average of 5,260 salmon.

In 2013, residents of Port Graham returned 10 permits and harvested 1,228 salmon (Table 11-2), similar to the 2011 harvest of 1,117 salmon by 13 permit holders (Fall, Braem, et al. 2012b). Nanwalek residents returned 4 permits and harvested a total of 7,669 salmon in 2013, a major increase from the 2012 harvest of 905 salmon by 1 permit holder. As shown in Table 11-2 and Figure 11-2, the combined harvest of the 2 communities of Nanwalek and Port Graham included 4,888 sockeye salmon, the species with the highest harvest (55% of the overall harvest), followed by coho salmon (2,685; 30%), chum salmon (897; 10%), pink salmon (410; 5%), and Chinook salmon (17; <1%). Sockeye salmon harvests increased from 961

salmon in 2012 to 4,888 salmon in 2013 and are a major reason for the overall increase in salmon harvests.

## SELDOVIA SUBSISTENCE FISHERY

### History and Regulations

The BOF established this subsistence set gillnet fishery in 1995. The fishery is located on the south side of Kachemak Bay, near Seldovia, which is in the Southern District of the Lower Cook Inlet Fisheries Management Area. The subsistence fishery operates in a split season. The spring fishery, open April 1–May 30, targets natural Chinook salmon migrating through Lower Cook Inlet. The fall fishery, open the first 2 weekends of August, targets coho salmon.

In the spring season, fishing is allowed during two 48-hour periods each week, while in the fall season, fishing is open continuously during the 2-day weekends. The BOF has set a guideline harvest level (GHL) of 200 Chinook salmon and an annual possession limit of 20 Chinook salmon per household. There are no seasonal limits for other salmon species.

The area open to subsistence set gillnetting includes those waters along the eastern shore of Seldovia Bay as well as a short stretch outside Seldovia Bay to the west of Point Naskowhak. Seasons and bag limits were designed in 1995 to reduce potential interceptions of enhanced Chinook salmon bound for the stocking site in the Seldovia small boat harbor (Hollowell et al. 2012:14). The gear allowed includes set gillnets no longer than 35 fathoms, no deeper that 45 meshes, and no larger than a 6-in stretched mesh. Other standard permit conditions include prohibition of fishing within 300 ft of a dam, fish ladder, weir, culvert, or other artificial obstruction.

### Harvest Assessment Methods

Household permits are issued by ADF&G prior to fishing, and harvests are recorded on the permits. Permits are also available from the harbormaster in Seldovia. Fishers are required to telephone daily harvest numbers to ADF&G or the harbormaster as well as to return their permits after each of the 2 fisheries. ADF&G sends reminder letters to permit holders if harvest records have not been returned in a timely manner, and telephone calls are also made to enhance permit returns.

### The 2013 Season

There were 12 permits issued for the Seldovia subsistence fishery in 2013; 8 were returned (Table 11-3). The estimated harvest was 147 sockeye salmon (63% of the overall harvest), 68 pink salmon (29%), 15 chum salmon (6%), 3 Chinook salmon (1%), and 2 coho (<1%) (Figure 11-3). All 12 permits that were issued in 2013 were issued to residents of Seldovia (Table 11-3).

Total salmon harvests in 1998 through 2005 were higher than the first 2 years of the fishery, the result of a longer season that began in 1998 when the BOF lengthened the season by 10 days in May. The additional fishing time resulted in increased harvests of both Chinook and sockeye salmon from 1998 through 2003 (Table 11-4). However, Chinook salmon harvests have declined since 2004, with 53 harvested in 2005, 23 harvested in 2006, 24 in 2007, 4 harvested in 2008, 15 harvested in 2009, 3 harvested in 2010, and no harvests in 2011. 2012 marked an increase with 8 Chinook salmon harvested, but then in 2013 the Chinook harvest decreased to 3 Chinook salmon reported harvested. Since the extension of fishing time in 1998, the 2006 season resulted in the lowest harvest estimate on record for total salmon harvested. The 2013 harvest was more than the 5-year (2008–2012) average of 197 salmon and 10-year (2001–2012) average of 230 salmon, but less than the historical average of 241 salmon (Table 11-4).

## TYONEK SUBDISTRICT

### History and Regulations

Subsistence salmon fishing regulations for the Tyonek Subdistrict were established by court order in 1980 and subsequently permanently established by the BOF. This setnet fishery is located in the Tyonek Subdistrict of the Northern District of Upper Cook Inlet. The subdistrict includes the area from 1 mile south of the mouth of the Chuitna River south to the easternmost part of Granite Point and from the mean point of high tide to the mean point of lower low tide. The area is unique in that all the lands within the subdistrict are owned by the Tyonek Native Corporation. This feature often raises issues of trespass for those individuals living outside the Tyonek Area who do not seek prior permission to land their boats or set their nets on the privately-owned uplands. For a detailed discussion of this fishery and other subsistence uses at Tyonek, see Fall et al. (1984), Holen and Fall (2011) and Stanek et al. (2007).

In 2011 the Alaska Board of Fisheries modified the Northern District King Salmon Management Plan (5 AAC 21.366). This modification was in response to reduced abundance of Chinook salmon in the Northern District. The sport fishery on the Chuitna River, which is at the northern edge of the Tyonek Subdistrict, was closed, and commercial fishing was closed from a point just south of the community to the Susitna River in 2011 (Shields and Dupuis 2012:10).

The season in this subsistence fishery also operates in 2 parts. The first part, which focuses on Chinook salmon, is open on Tuesdays, Thursdays, and Fridays from May 15–June 15. The second part is open Saturdays from June 16–October 15. In 2011 the Alaska Board of Fisheries specified the amounts of salmon reasonably necessary for subsistence in the Tyonek subdistrict as 700–2,700 Chinook salmon and 150–500 other salmon. A permit is required and 5 AAC 01.595 (a)(3) specifies that each permit holder may harvest 70 Chinook salmon in the Tyonek Subdistrict and 25 other salmon for the head of household and an additional 10 salmon for each dependent of the permit holder.

Allowable gear for the Tyonek Subdistrict subsistence fishery includes set gillnets 10 fathoms in length, no deeper than 45 meshes, and a stretched mesh sized no larger than 6 in. When fishing, permit holders are required to be present at the net site. Other standard permit conditions include prohibition of fishing within 300 ft of a dam, fish ladder, weir, culvert, or other artificial obstruction.

### Harvest Assessment Methods

Household permits are issued by ADF&G prior to fishing, and harvests are recorded on the permit. A Division of Subsistence staff person travels to Tyonek each April and issues approximately 40–50 permits within several hours. Permits are also available in the Anchorage ADF&G office or in the Tyonek village office. Reported harvests are not expanded in this fishery. Because of the high compliance with the permit requirement and the strong support of the Tyonek village government, ADF&G views the harvest estimates for this fishery as very reliable.

### The 2013 Season

In 2013, 82 permits were issued for the Tyonek Subdistrict subsistence salmon fishery, including 59 permits issued to Tyonek residents (72%) and 23 permits issued to other Alaska residents, including 14 to residents of Anchorage (17%; Table 11-5). Residents of Tyonek accounted for 71% of the reported harvest total (842 salmon), including 78% of the reported Chinook salmon harvest (636 Chinook salmon) (Table 11-5).

The 2013 reported harvest of 1,185 salmon was lower than the historical average of 1,501 salmon. The 2013 harvest was notably higher than the 2011 harvest of 789 salmon which was the lowest reported harvest since 1981, although the number of returned permits was higher than the historical average of 58 permits (Table 11-6). Of the total reported subsistence salmon harvest in 2013, 813 were Chinook salmon

(69%), 181 were coho salmon (15%), 172 were sockeye salmon (15%), 19 were pink salmon (2%), and there were no chum salmon harvested in 2013 (Figure 11-4).

## UPPER YENTNA RIVER FISH WHEEL FISHERY

### History and Regulations

This subsistence fish wheel fishery began in 1996 as a personal use fishery and was reclassified as a subsistence fishery by the BOF in 1998. It is located in the mainstem of the Yentna River from its confluence with Martin Creek upstream to its confluence with the Skwentna River. The fishery occurs from July 15 through July 31. Fishing periods are from 4:00 AM to 8:00 PM Mondays, Wednesdays, and Fridays. For a more detailed discussion of this fishery see Holen and Fall (2011).

Legal gear includes a fish wheel equipped with a live box. Permit holders must be present at the fish wheel while the wheel is fishing. A season limit of 2,500 salmon was established for the fishery. Chinook salmon and rainbow/steelhead trout must be returned alive to the water. Seasonal limits for households are 25 salmon for a household of 1 plus 10 salmon for each additional household member. Other standard permit conditions include prohibition of fishing within 300 ft of a dam, fish ladder, weir, culvert, or other artificial obstruction.

### Harvest Assessment Methods

A permit issued by ADF&G is required prior to fishing. Permits are available through the Division of Sport Fish offices in Palmer and Anchorage. Permit holders must record their harvests on the permit and return it to ADF&G. Participants must also report their daily harvest of salmon to the Palmer ADF&G office by noon of the day following an open period. In the view of ADF&G, compliance with the permit requirement is high and harvest estimates for this fishery are very reliable.

### Harvests in 2013

In 2013, 22 subsistence permits were issued for the Yentna River subsistence fish wheel fishery and 19 were returned (tables 11-7 and 11-8). In 2013, 9 of the 22 permit holders resided in the Skwentna area (41%), with the remaining 13 permits held by residents of other Cook Inlet area communities (Figure 11-5). Permit holders living in the community of Skwentna in 2013 harvested 211 of the reported 412 salmon, or 51% of the harvest (Table 11-7).

Of the total harvest of 412 salmon reported in 2013, 160 were sockeye salmon (39%), 128 pink salmon (31%), 92 coho salmon (22%), and 32 chum salmon (8%) (Figure 11-6). There were no reported harvests of Chinook salmon nor is it legal to retain the harvest. The 2013 harvest of 412 salmon was higher than the 2012 harvest of 343 salmon. The 2013 harvest was less than the 5-year average of 561 salmon, less than the 10-year average of 538 salmon, and also less than the historical average of 557 salmon (Table 11-8).

## FEDERAL SUBSISTENCE SALMON FISHERIES IN COOK INLET

Since 2007 federal regulations allow for the harvest of salmon, trout, and Dolly Varden by residents of Cooper Landing, Hope, and Ninilchik in the Kenai National Wildlife Refuge and Chugach National Forest. This includes the harvest of salmon by dip net in the Kenai River. In 2013, the total harvest in the federal fishery on the Kenai and Kasilof rivers was 1,519 salmon, all of which were sockeye salmon (Table 11-9). There were a total of 142 permits issued to residents of these 3 communities, with 83 permits issued to residents of Cooper Landing, 28 to residents of Hope, and 31 to residents of Ninilchik (Table 11-9).

Table 11-10 shows the harvest over time, but only includes the years 2007–2013 because this is a new fishery. In all 7 years, sockeye salmon are a majority of the harvest, with 2008 being the highest harvest, at 1,716 sockeye salmon harvested by residents of the 3 Kenai Peninsula communities.

## COOK INLET PERSONAL USE SALMON FISHERIES

### Background

The BOF first established personal use salmon fisheries in the Cook Inlet Area in 1981 (Nelson et al. 1999:146). Since Alaska statehood in 1959, opportunities had been provided to harvest salmon for home uses with noncommercial set gillnets along various Cook Inlet beaches under subsistence regulations (Braund 1982rev.). In 1978, the new Alaska subsistence statute defined, for the first time, subsistence fishing as fishing for "customary and traditional" uses [AS 16.05.940(31, 33)]. In 1980, the BOF determined that only the noncommercial net fisheries in the Tyonek and Port Graham subdistricts met the criteria to qualify as customary and traditional subsistence fisheries. Therefore, the BOF created the "personal use" category of fishing regulations to continue providing opportunities for Alaskans to harvest salmon for home use with nets in areas of Cook Inlet that are generally accessible along the road system. In 1992, the Joint Board classified most of the Cook Inlet Area as a "nonsubsistence area," where subsistence fishing may not be permitted. Thus, in these areas, personal use fisheries are the primary means by which Alaska residents may obtain salmon for home uses using setnets or dip nets.

Due primarily to court decisions and legislation, personal use fishing regulations for Cook Inlet changed frequently in the 1980s and early 1990s. In 1981, the BOF created personal use dip net fisheries targeting sockeye salmon in the Kasilof and Kenai rivers. Until 1996, these fisheries opened only after achievement of escapement goals was projected. Since then, they have taken place within a fixed season. In 1986, the BOF created a personal use dip net fishery at the mouth of Fish Creek (Knik Arm) focusing on sockeye salmon. A fourth Upper Cook Inlet dip net fishery began in 2008 in the lower portion of the Beluga River on the western shore of Cook Inlet; this fishery is open only to Alaska residents 60 years of age or older. In most years since 1981, personal use set gillnet fisheries in the Cook Inlet Area have been limited to Kachemak Bay and an area at the mouth of the Kasilof River. For more detail on the history of subsistence and personal use salmon fisheries in the Cook Inlet Area, see Braund (1982rev.), Fall and Stanek (1990), Brannian and Fox (1996), Nelson (1994), Nelson (1995), Nelson et al. (1999), and Dunker (2010). Table 11-11 summarizes harvest data for selected Cook Inlet personal use and subsistence fisheries that are no longer authorized by state regulations.

### Upper Cook Inlet Personal Use Salmon Fisheries

Presently, personal use salmon fisheries in the Upper Cook Inlet Area are governed by the provisions of the Upper Cook Inlet Personal Use Salmon Fishery Management Plan (5 AAC 77.540). Participants must possess an Alaska resident sport fishing license and obtain an Upper Cook Inlet Personal Use Fishing Permit for their household. Permit holders and household members may participate in any of the upper inlet personal use salmon fisheries (except, as noted, the Beluga River fishery is only open to Alaska residents 60 years of age or older). For all the fisheries combined, the annual limit is 25 salmon for the permit holder and 10 salmon for each additional household member. Permits must be returned to ADF&G at the end of the season with a record of the harvest.

In 2013, 35,211 permits were issued for Upper Cook Inlet personal use fisheries, excluding the Beluga River dip net fishery. For the 4 fisheries combined (including unknown fishing locations), the estimated harvest was 464,995 salmon, including 454,315 sockeye (98%), and there were lower totals for the other 4 species (Table 11-12). The estimated harvest in 2013 was the lowest harvest since 2008 in these fisheries. For 1996 through 2012, the average annual harvest was 330,455 salmon, although participation and harvest grew steadily (Table 11-13).

Table 11-14 reports the number of permits issued for these 4 Upper Cook Inlet personal use fisheries and the estimated harvest by place of residence of the permit holder. Residents of the Municipality of Anchorage (including Anchorage, Chugiak, Eagle River, JBER [Joint Base Elmendorf/Richardson], and Girdwood) held the most permits (58%) and accounted for 57% of the harvest, followed by Kenai Peninsula Borough residents (19% of permits; 19% of harvests), Matanuska–Susitna Borough residents

(17% of permits; 18% of harvest), residents of other Alaska communities (4% of permits; 5% of harvest), and permit holders for whom a community of residence could not be established (2% of permits; 1% of harvest).

### *Kasilof River Personal Use Setnet Fishery*

This fishery takes place at the mouth of the Kasilof River between regulatory markers approximately 1 mile on either side of the river. Legal gear is a set gillnet no more than 10 fathoms in length, 6 inches in mesh size, and 45 meshes in depth. The fishery is open daily from 6:00 AM to 11:00 PM from June 15 through June 24. In 2013, the total estimated harvest in the fishery was 14,622 salmon, of which 14,439 (99%) were sockeye salmon. (Note that the harvests for this setnet fishery plus the dip net fisheries in the Kasilof River, the Kenai River, and Fish Creek are reported through a single permit system, the combined estimated totals are reported above.) The average annual harvest from 1996 through 2012 was 19,868 salmon (Table 11-15).

### *Kasilof River Dip Net Fishery*

This dip net fishery takes place in the lower mile of the Kasilof River 24 hours per day from June 25 through August 7. Retention of Chinook salmon in this fishery is prohibited. The estimated harvest in 2013 was 88,234 salmon, of which 97% was sockeye salmon. From 1996 through 2012, the average annual harvest in this fishery was 46,768 salmon (Table 11-16).

### *Kenai River Dip Net Fishery*

This dip net fishery takes place in the lower Kenai River downriver of the Warren Ames Bridge. Fishing is open from July 10 through July 31, 7 days per week from 6:00 AM to 11:00 PM; when the abundance of sockeye salmon is greater than 2 million fish, the fishery may be open by emergency order 24 hours a day. No more than 1 Chinook salmon per permit may be retained in this fishery. Estimated harvests totaled 354,728 salmon in 2013, including 347,222 sockeye salmon (98%). The average annual harvest from 1996 through 2012 was 249,710 salmon, with harvest—along with participation—rising markedly over that period (Table 11-17).

### *Fish Creek Dip Net Fishery*

This dip net fishery opens by emergency order if the department projects an escapement into Fish Creek (Knik Arm) of more than 50,000 sockeye salmon. The season is July 10 through July 31. Open waters extend from the terminus of Fish Creek upstream to one-quarter of a mile above the Knik–Goose Bay Road. No Chinook salmon may be retained in this fishery. The fishery did not open in 2013. The most recent harvest numbers are from 2011 when the estimated harvest totaled 6,370 salmon, 82% of which was sockeye salmon. This was substantially lower than the record harvest of 29,304 salmon estimated for 2010. The fishery did not open from 2002 through 2008. The average annual harvest for those years with an open fishery from 1996 through 2010 was 9,664 salmon (Table 11-18).

### *Unknown Upper Cook Inlet Personal Use Dip Net Fishery*

Because not all participants in the Upper Cook Inlet personal use dip net fisheries indicate the location of their fishing activities when they return their permits, an estimate of harvests in an "unknown" Upper Cook Inlet dip net fishery is produced annually. Harvests that could not be attributed to one of the 4 Upper Cook Inlet personal use fisheries (3 dip net fisheries and 1 set net fishery) (excluding the Beluga River fishery, which is discussed below) were estimated at 7,411 salmon in 2013, 96% of which was sockeye salmon (7,126 sockeye salmon reported harvested) (Table 11-19).

### *Beluga River Personal Use Salmon Fishery*

Participation in this dip net fishery, which first took place in 2008, is limited to Alaska residents 60 years of age or older. The fishery is open 24 hours per day from July 10 to August 31 within the Beluga River, western Cook Inlet, from about one-quarter mile upstream of the Beluga River bridge to about 1 mile

below the bridge. The fishery operates under the single seasonal limit for Cook Inlet Area personal use salmon fisheries (25 salmon for the permit holder and 10 additional salmon for each dependent), except only 1 Chinook salmon may be retained. Participants must report their harvest weekly to ADF&G, and the fishery closes when 500 salmon have been harvested (5 AAC 77.540(g)). Harvests totaled 88 salmon in 2013, compared to 16 salmon in 2012, 159 salmon in 2011, 53 salmon in 2010, 225 salmon in 2009, and 66 salmon in 2008 (Table 11-20). Harvest data by place of residence are presently not available for this fishery, and totals for this fishery are not included with other Upper Cook Inlet personal use fisheries summarized in Table 11-14.

### Lower Cook Inlet Personal Use Salmon Fisheries

#### *Kachemak Bay Setnet Fishery*

This setnet fishery along Kachemak Bay in the Lower Cook Inlet Management Area was a subsistence fishery before being reclassified as a personal use fishery in the early 1980s. By regulation, the fishery is open from August 16 through September 15, from 6:00 AM Monday until 6:00 AM Wednesday and from 6:00 AM Thursday until 6:00 AM Saturday. The fishery closes when a guideline harvest range of 1,000–2,000 coho salmon has been achieved. Participants must obtain a permit from the Homer ADF&G office—this is separate from the permit program for the Upper Cook Inlet personal use fisheries. Seasonal limits are 25 salmon for the permit holder and 10 salmon for each additional household member (5 AAC 77.549). Fishers must phone the Homer ADF&G office to report their daily harvests.

In 2013, the reported harvest, based on 118 returned permits (96% of the 123 permits issued), was 2,001 salmon, of which 1,732 (87%) were coho. The recent 10-year average harvest for this fishery (2003–2012) was 1,621 salmon (Table 11-21). Harvest data by place of residence are presently not available for this fishery. Table 11-21 also provides historical harvests for this fishery for 1969 through 2013.

#### *China Poot Dip Net Fishery*

This personal use dip net fishery first opened in 1980. It takes place in China Poot Bay, approximately 4 miles southeast of the Homer Spit, on the south side of Kachemak Bay. This area is not accessible by road. The fishery targets enhanced sockeye salmon (stocked by the Cook Inlet Aquaculture Association) that have escaped the commercial fishery. Personal use fishers must have a valid Alaska resident sport fishing license, but a permit is not required. The season is July 1 through August 7. Only sockeye salmon may be retained in this fishery, with a bag and possession limit of 6 fish (5 AAC 77.545). Since 1996, ADF&G has not estimated harvests in this fishery. Table 11-22 summarizes historical harvest data for this fishery for 1980–1995. During those years, sockeye salmon harvests ranged between 794 (in 1985) and 8,605 (in 1995) and averaged 3,373 sockeye salmon. The annual average participation in this fishery was 1,215 fishers.

## OTHER SUBSISTENCE FISHERIES IN COOK INLET

Federal halibut subsistence harvest data are currently available for communities and tribes in the Cook Inlet area. Residents of Port Graham, Nanwalek, and Seldovia participate in this program. For the findings for 2012, see Fall and Koster (2014). Due to funding limitations, harvest estimates for the subsistence halibut fishery are not available for 2013.

There are no annual harvest assessment programs for other subsistence finfish fisheries in Cook Inlet. Harvest estimates based on comprehensive household surveys conducted by the Division of Subsistence are available in the CSIS for freshwater and marine species spanning multiple years for selected Cook Inlet communities. Of note in Lower Cook Inlet are rockfish (*Sebastes*) documented in Turek et al. (2009). Information on other fish species used in Upper Cook Inlet by Tyonek and Beluga residents can be found in Stanek et al. (2007).

Table 11-1.–Historical subsistence salmon harvests, Port Graham and Koyuktolik subdistricts, 1981–2013.

| | Permits | | Reported salmon harvest | | | | | |

*Source* Ruesch and Fox (1996); Brannian and Fox (1996).

a. Years listed are only the years in which the fishery was open.

b. In 1991, the fall coho fishery operated as a personal use fishery separate from subsistence setnet fisheries (Ruesch and Fox 1992).

-continued-

c. Summary data reported in Ruesch and Fox (1996) and in Brannian and Fox (1996) include dip net and setnet harvests. Here, only setnet harvests are included. See separate tables for the Kasilof River dip net fishery and the Kenai River dip net fishery for harvest data for those fisheries.

d. In 1985, this subsistence fishery was open in areas generally open to commercial fishing, except for the Upper Subdistrict, which had a separate season and permit (called the "fall coho fishery" in this table). The Knik Arm subsistence gillnet fishery was also administered separately in 1985 (Ruesch 1987).

e. For 1991, 1992, 1994, and 1995, the number of permits issued includes all Upper Cook Inlet dip net and setnet fisheries except the Tyonek subdistrict.

NA = Data not available.

a Permits are not issued for this fishery and harvest estimates are not produced.
b Estimated harvests for all fisheries except Kachemak Bay setnet. Only reported harvests are available.
c A single permit is issued for the Kasilof setnet, Kasilof dip net, Kenai dip net, and Fish Creek dip net fisheries. In some cases, returned permits did not indicate the area fished.

Table 11-13.–Estimated personal use salmon harvests, Upper Cook Inlet personal use fishery total, 1996–2013.

| | Permits | | Estimated salmon harvest | | | | | |
|---|---|---|---|---|---|---|---|---|
| Year | Total | Returned | Chinook | Sockeye | Coho | Chum | Pink | Total |
| 1996 | 14,576 | 13,452 | 452 | 145,545 | 4,811 | 350 | 2,973 | 154,131 |

a The fishery was closed 1992, 1994, and 1995.

b This fishery was administered separately from the subsistence setnet fisheries that operated in 1991 (Ruesch and Fox 1992).

c Current regulations in place since 1996. Permits since 1996 issued for 4 Upper Cook Inlet personal use salmon fisheries.

d Historical average based on years since 1996 when current regulations were adopted.

*Source* Nelson et al. (1999) for 1981–1990 and 1993-1995; Brannian and Fox (1996) for 1991, 1992, and 1994; Division of Sport Fish for 1996-2013.

a. Personal use harvests are estimated based on the annual sport harvest survey conducted by the Division of Sport Fish prior to 1996, and are estimated based on permit returns since 1996. Only sockeye salmon harvests reported, 1981–1990.

b. Fishery closed 1989–1990, and 1993. Classified as a subsistence fishery in 1991 and 1992.

c. In 1991, 1992, and 1994, a single permit issued for all Upper Cook Inlet subsistence fisheries except Tyonek (central dip net, central setnet, northern setnet) (Brannian and Fox 1996). Permit return rate for 1992 was approximately 43.2% (Ruesch and Fox 1993).

d. Harvests for 1991 and 1992, and subsistence harvests for 1994, are reported, not estimated.

e. In 1994 both a subsistence and a personal use dip net fishery took place in the Kasilof River (Nelson 1999). Sockeye harvests included 3,679 salmon in the personal use fishery and 2,735 salmon in the subsistence fishery. Harvest data for other species in the personal use fishery are not available.

f. Current regulations have been in place since 1996. Permits have been required since 1996 and are issued for 4 Upper Cook Inlet personal use fisheries.

g. Historical average based on years since 1996 when current regulations were adopted.

NA = Data not available.

*Source* Nelson et al. (1999) for 1981–1990 and 1993–1995; Brannian and Fox (1996) for 1991, 1992, and 1994; Division of Sport Fish for 1996–2013.

a. Personal use harvests are estimated based on the annual sport harvest survey conducted by the Division of Sport Fish prior to 1996, and are estimated based on permit returns since 1996. Only sockeye salmon harvests reported, 1981–1990.

b. Fishery closed 1981, 1984–1986, and 1990. Classified as a subsistence fishery in 1991, a portion of 1992 and 1994.

-continued-

c. The 1982 harvest is reported as "unknown" but "insignificant" (Nelson 1999; Brannian and Fox 1996).

d. Subsistence harvests for 1991, 1992, and 1994 are reported, not estimated.

e. 1991, 1992, and 1994 permits: single permit issued for all Upper Cook Inlet subsistence fisheries except Tyonek.

f. Harvests for 1992 include 16,240 sockeye salmon in the subsistence fishery and 12,189 sockeye in the personal use fishery. Harvests for other species are for the subsistence fishery only. Personal use harvests are not available for the other species.

g. Current regulations have been in place since 1996. Permits have been required since 1996 and are issued for 4 Upper Cook Inlet personal use fisheries.

h. Historical average based on years since 1996 when current regulations were adopted.

# CHAPTER 12: PRINCE WILLIAM SOUND AREA

## INTRODUCTION

The Prince William Sound (PWS) Management Area includes all waters of Alaska between the longitude of Cape Fairfield and the longitude of Cape Suckling. The PWS Management Area's main geographical features are the Copper River, the Copper River's tributaries, and Prince William Sound. It has a total land area of 38,000 square miles.

The topography of the large and complex Prince William Sound on the edge of the Gulf of Alaska along with the Copper River and other smaller freshwater systems feeding into the sound create ecological conditions supporting many salmon runs. The area supports both natural and enhanced runs of pink (*Onchorhychus gorbuscha*), sockeye (*O. nerka*), chum (*O. keta*), coho (*O. kisutch*) and Chinook (*O. tshawytscho*) salmon.

Personal use and subsistence fisheries within these waters provide salmon to households within the Copper River Basin, Prince William Sound, and other communities across Alaska. Subsistence fisheries are not permitted in the Valdez Nonsubsistence Area (5 AAC 99.015(a) (5)). In 2013, approximately 12,800 personal use and subsistence permits for the Prince William Sound Area were issued to Alaska residents. The personal use and subsistence harvest totaled 285,000 salmon in 2013.

The area supports commercial gillnet and purse seine fisheries for all salmon types. Six hatcheries run by nonprofit aquaculture associations contribute pink, sockeye, and chum salmon to the area's fisheries. The Gulkana Hatchery in Paxson augments production of sockeye salmon to the Copper River.

In 2013 there were 8 subsistence and 1 personal use fisheries with annual harvest assessment programs in the Prince William Sound Management Area:

- In the Upper Copper River:
    - Glennallen Subdistrict: state subsistence permit program,
    - Glennallen Subdistrict: federal subsistence permit program
    - Chitina Subdistrict: state personal use permit program,
    - Chitina Subdistrict: federal subsistence permit program,
    - Batzulnetas: a federal subsistence permit program,
- In Copper River Flats–Prince William Sound: state subsistence permit program
- In Prince William Sound's waters:
    - Eastern District–Tatitlek: state subsistence permit program
    - Southwestern District–Chenega Bay: state subsistence permit program, and
    - Prince William Sound, general area: state subsistence permit program.

The Upper Copper River area is accessible by the Richardson Highway and the Glenn Highway. The Copper River Delta and communities along the Prince William shoreline are accessible primarily via the Alaska Marine Highway, boat, or plane, with the exception of Valdez, which is accessed by the Richardson Highway. The permit holder data reported in this chapter reflect different levels of use depending on the accessibility of these areas and demonstrate which areas are used by local or regional users, or both, for subsistence and personal use fishing. Other communities that show a high amount of use of the PWS fisheries are Anchorage, Fairbanks, Palmer, and Wasilla.

The communities of the Copper River Basin generally range from around 90 people up to over 350 people. The total population of the Copper River Basin in 2010 was nearly 3,000 people. There are fewer communities along the coastline of the Prince William Sound Management Area, but the largest communities within the management area are Valdez with about 4,000 residents and Cordova with about 2,200 residents. The other smaller coast communities are Tatitilek with 87 residents, Whittier with 220 residents, and Chenega with 63 residents.[1]

For both state and federal management purposes, the Upper Copper River District of the Prince William Sound Management Area consists of all waters of the mainstem Copper River from the mouth of the Slana River downstream to an east–west line crossing the Copper River approximately 200 yards upstream of Haley Creek as designated by ADF&G regulatory markers. There are 2 subdistricts: the Chitina Subdistrict, which consists of all waters of the Upper Copper River District downstream of the downstream edge of the Chitina–McCarthy Road Bridge, and the Glennallen Subdistrict, which consists of all remaining waters of the Upper Copper River District.

The Glennallen and Chitina subdistricts have had separate state and federal permit programs since 2002. The year 2013 was the 12th year with separate state and federal permit programs for the Glennallen and Chitina subdistricts. It should also be noted that the dip net fishery that takes place in the Chitina Subdistrict of the Upper Copper River District under state regulations was classified as a personal use fishery through 1999. The BOF reclassified this fishery as subsistence in 2000, and again as personal use in 2003 (with no other regulatory changes). Historical data for this fishery, including years when it was classified as subsistence or personal use, are included in statewide summaries as personal use. The state established the Glennallen and Chitina subdistricts in 1977. Prior to that time, the Upper Copper River was treated as one unit for management purposes. For a detailed discussion of the history of these fisheries, see Simeone and Fall (1996).

Under the provisions of 5 AAC 01.630 (h), a village council or other similarly qualified organization may obtain a permit to operate a fish wheel on behalf of its members upon approval of a harvest assessment plan submitted to ADF&G. These organizations may also issue household permits and register fish wheels. Table 12-1 summarizes data for the permits issued for village fish wheels by ADF&G from 1997 through 2011; in 2012 and 2013, no fish wheel permits were issued. Since 1997 permits have been issued to tribal organizations from Chistochina, Gakona, Kluti-Kaah, Chickaloon, and Chitina.

## UPPER COPPER RIVER STATE AND FEDERAL SUBSISTENCE FISHERIES: GLENNALLEN SUBDISTRICT

### Regulations

The Glenallen Subdistrict is that portion of the mainstem Copper River upstream of the McCarthy Bridge to the mouth of the Slana River. It is open June 1 to September 30 for continuous fishing. The federal subsistence fishery opens earlier on May 15. All tributaries of the Copper River, including the Chitina River are closed to subsistence fishing.

In the Glennallen Subdistrict permits are issued on a household basis and are required to participate in the state and federal subsistence salmon fisheries. ADF&G issues state permits upon request at ADF&G offices (in Glennallen, Tok, Delta Junction, Fairbanks, Palmer, and Anchorage) under the authority of 5 AAC 01.630. In 2002, the FSB created a federal permit requirement for qualified rural residents (primarily residents of Copper River Basin and Upper Tanana communities), which is administered by the National Park Service (NPS). Federal permits can be applied for in person at the NPS Wrangell-St. Elias Visitor's Center in Copper Center or the Slana Ranger Station.

1. ADLWD (Alaska Department of Labor and Workforce Development). "Population of Alaska by Economic Region, Borough and Census Area, 2010–2014." Juneau: State of Alaska Department of Labor and Workforce Development, Research and Analysis Homepage: Population, n.d. http://laborstats.alaska.gov/pop/popest.htm.

In the state fishery, households may participate in either the Chitina Subdistrict personal use fishery or the Glennallen Subdistrict subsistence fishery in any given year, but not both. Federally-qualified rural resident households may hold permits for both the federal and state Glennallen Subdistrict fisheries, or for the Glennallen federal fishery and the Chitina state personal use fishery, although state and federal harvest limits are not additive. Other standard permit conditions include prohibition of fishing within 300 ft. of a dam, fish ladder, weir, culvert, or other artificial obstruction. Under federal regulations, the total number of salmon per household taken within the Upper Copper River District exchanged in customary trade may not exceed 50% of the annual harvest limit per household and may not exceed the total cash value of $500 annually. State regulations for the district do not allow exchange of subsistence-caught fish for cash.

In the Glennallen Subdistrict under state regulations, fishers may use either fish wheels or dip nets, but not both types of gear. Federal subsistence permit holders may use rod and reel in addition to fish wheels and dip nets, and they may use all 3 types of gear, but not at the same time. The state season is June 1–September 30; the federal season is May 15–September 30. Annual limits are the same under state and federal regulations: 30 salmon for a household with 1 person or 60 salmon for a household of 2 persons, of which no more than 5 may be Chinook salmon if taken with a dip net. For a household of more than 2, 10 salmon for each additional person may be added to the annual limit. Upon request, permits can be issued for additional salmon, with limits of 200 salmon for 1-person households and 500 for households of 2 or more persons. The number of Chinook salmon (5) taken by dip net does not increase under state regulations; federal permit holders may take up to 5 additional Chinook salmon with rod and reel.

## Harvest Assessment Program

Annual subsistence salmon harvest assessments have been conducted for the Upper Copper River since 1960, originally by the Division of Commercial Fisheries but currently by the Division of Sport Fish. Permits include harvest reports, and fishers are required to record the dates they fished and the number of each species harvested each day. Total harvest estimates for the fishery are made based on reported harvests expanded to all permit holders. Beginning in 2002, the NPS, on behalf of the FSB, has compiled the data from federal permit returns in a program separate from that administered by ADF&G.

The creation of a dual permit program for subsistence fishing in the Upper Copper River creates challenges for the compilation of a single subsistence harvest estimate for this subsistence fishery, which is the goal of this annual report. Issues include the following:

- As noted above, federal permits allow fishing with multiple gear types, including rod and reel, but state permits allow fishing with only 2 gear types—dip nets or fish wheels. Thus while prior to 2003, annual report summaries for the Glennallen Subdistrict showed the number of permits issued by gear type, this is not possible for the combined state and federal data summaries reported here.
- Some households obtain both the state and federal permit for the Glennallen Subdistrict. Of these "dual-permitted" households, some report harvest and effort only on their state permits (not returning the federal permit), some report harvest and effort only on their federal permits (not returning the state permit), some report identical harvests and efforts on both permits, and some return neither permit. Editing the data to compensate for double-reporting of salmon harvest and effort requires 2 assumptions: 1) permittees returning only 1 permit did not report harvest or effort on the other, and 2) permittees reporting identical harvests and efforts on both permits reported identical harvests twice rather than split their harvests between permits. These assumptions were employed in the analysis only after discussing the dual-permitted households with the program administrators in the Division of Sport Fish and NPS. All households obtaining both state and federal permits were counted as receiving only 1 permit in the summary tables for the Glennallen Subdistrict included here.

- Until 2006, state permits collected only the permit holder's city in terms of their mailing address, but federal permits collected this and the "community of primary residence." Since the Copper River area has a number of smaller communities without their own post offices, state permits issued to residents of these communities prior to 2006 did not provide adequate information to assure analysis results accurately reflect the true community residency of harvesters. But because of the precision of the federal permit regarding place of residence, the federal permit place of residence data were used to compile the harvest tables, in combination with the mailing address data from state permits. Since there were several dual-permitted households in the Glennallen Subdistrict fishery, the federal residence community was used as the default where this information differed.

### Subsistence Salmon Harvests in 2013

As shown in Table 12-2, ADF&G and NPS issued a total of 1,616 subsistence salmon permits for the Glennallen Subdistrict for 2013. This total is higher than both the recent 5-year average (1,559 permits), 10-year average (1,417 permits), and the historical average (1989–2012; 1,118) and represents a relatively steady increase in issued permits since 1989.

Table 12-2 also reports the estimated total Glennallen Subdistrict subsistence salmon harvest in 2013 for both federal and state fisheries was 99,390 salmon, the majority of which were sockeye salmon. The 2013 harvest by species was as follows: 96,573 sockeye salmon (approximately 97% of the year's salmon harvest), 2,663 Chinook salmon, and 154 coho salmon. Pink and chum salmon are not generally available in the Upper Copper River, although a few chum salmon are sometimes reported.

As reported in Table 12-2, the 2013 harvest was higher than the 5-year average (82,946 salmon), 10-year average (83,850 salmon), and the historical average (1989–2012; 70,106 salmon). Table 12-3 reports subsistence salmon harvests in the Glennallen Subdistrict by place of residence of permit holders in 2013. Copper Basin residents caught 27% of the harvest (27,188 salmon) and other Alaska residents harvested 73% (72,202 salmon). Of all Glennallen Subdistrict permits issued for both federal and state, residents of Copper Basin communities held 353 permits (approximately 22%) and other Alaska residents held 1,263 permits (78%) (Table12-3). The communities with the most permits and salmon harvested were Anchorage with 359 permits, Fairbanks with 247 permits, Wasilla with 192 permits, Palmer with 108 permits, and Copper Center with 110 permits issued.

## UPPER COPPER RIVER STATE PERSONAL USE FISHERY: CHITINA SUBDISTRICT

### Background and History

The Chitina Subdistrict consists of all waters of the Upper Copper River District downstream of the downstream edge of the Chitina–McCarthy Road Bridge to an east–west line crossing the Copper River approximately 200 yd. upstream of Haley Creek. The Chitina personal use fishery is restricted to the waters of the mainstem Copper River. In 1984, and from 1986 through 1999, the Chitina Subdistrict was closed to subsistence fishing, and the dip net fishery was operated as a personal use fishery. At its December 1999 meeting, the BOF reversed an earlier decision, determined that the Chitina Subdistrict supported C&T uses of salmon, and returned the classification to subsistence. In February 2003, the BOF reconsidered the subsistence classification of the Chitina dip net fishery, reversed its decision of 1999, made a negative C&T finding, and returned the classification to personal use. No other regulatory changes were made at that time. For a detailed discussion of the history of these fisheries, see Simeone and Fall (1996) and ADF&G (2003).

The Chitina Subdistrict personal use fishery is open by emergency order from week to week from June 7 through September 30. The weekly fishing periods and limits are established by emergency order and are based on the projected in-river returns on escapement estimates at the sonar station located at Miles Lake.

### Regulations

There are state and federal permit programs for the Chitina Subdistrict. Under state regulations, a household permit and an Alaska state resident sport fishing license are required for personal use fishing in the Chitina Subdistrict. Households may not possess both the Chitina state personal use permit and the Glennallen state subsistence permit in the same year. Under state regulations, dip nets are the only legal gear in the Chitina Subdistrict. Annual limits are 15 salmon for a 1-person household and 30 salmon for households of 2 or more. Only 1 Chinook salmon may be harvested annually. If ADF&G authorizes a supplemental harvest period by emergency order, permit holders who have already filled their original limit may take 10 additional sockeye salmon during each announced supplementary period. Rainbow/steelhead trout taken by dip net under the state fishery must be released immediately and returned to the water unharmed. Other standard permit conditions include prohibition of fishing within 300 ft. of a dam, fish ladder, weir, culvert, or other artificial obstruction.

The Chitina Subdistrict state fishery is managed under the Copper River Personal Use Dip Net Salmon Fishery Management Plan (5AAC 77.591).

### Harvest Assessment Program

Annual subsistence–personal use salmon harvest assessments have been conducted by ADF&G, currently by the Division of Sport Fish, in the Upper Copper River Area since 1960. Chitina Subdistrict permits include harvest reports, and fishers are required to record the dates they fish, the number of each species harvested each day, whether they fished from a boat or from shore, and if they fished during a supplemental harvest period. Total harvest estimates for the state personal use fishery are made based on reported harvests expanded to all permit holders.

### Personal Use Salmon Harvests in 2013

As reported in Table 12-4, the estimated total salmon harvest in the Chitina Subdistrict personal use fishery in 2013 was 187,614 fish, including 185,970 sockeye salmon (99%), 762 Chinook salmon, and 882 coho salmon, by 10,424 permit holders. The 2013 total estimated harvest for the Chitina Subdistrict was the highest ever estimated for this fishery, well above the recent 5-year (121,116 salmon) and 10-year (121,433 salmon) averages, as well as the historical average (1989–2012; 114,311 salmon). It should be noted however that the 2013 Chinook salmon harvest was down significantly from the 5-year, 10-year, and historical averages, as was the 2013 coho salmon harvest.

Table 12-5 reports estimated salmon harvests in the Chitina Subdistrict personal use fishery by mailing address of state permit holders in 2013; most participants in this fishery lived in Fairbanks, Anchorage, or the Matanuska–Susitna Borough. Only 43 Copper Basin residents (<1%) obtained state personal use salmon permits for the Chitina Subdistrict in 2013. The other 10,381 permits were issued to non-area residents. Non-area residents harvested all but 654 of the salmon harvested and harvested only sockeye salmon in this fishery in 2013 (>99%). The communities with the most permits issued were Fairbanks with 3,019 permits, Anchorage with 2,780 permits, Wasilla with 983 permits, North Pole with 929 permits, Palmer with 548 permits, and Delta Junction with 438 permits.

## UPPER COPPER RIVER FEDERAL SUBSISTENCE FISHERY: CHITINA SUBDISTRICT

### Regulations

In 2013, qualified Alaska rural residents could obtain federal subsistence permits for the Chitina Subdistrict from NPS. Legal gear included fish wheels, dip nets, and rod and reel. Federally-qualified rural resident households may hold permits for both the federal and state Chitina Subdistrict fisheries, or for the Chitina federal fishery and the Glennallen state subsistence fishery, although state and federal harvest limits are not additive. Federal seasonal limits for the Chitina Subdistrict were the same as for the Glennallen Subdistrict, but also cannot be combined. Under federal regulations, rainbow/steelhead trout

incidentally taken from fish wheels could be retained. Other standard permit conditions include prohibition of fishing within 300 ft. of a dam, fish ladder, weir, culvert, or other artificial obstruction.

### Federal Subsistence Harvests in 2013

As reported in Table 12-6, an estimated 2,428 salmon were harvested in the federal Chitina Subdistrict subsistence fishery in 2013. The recent 5-year average is 2,444 salmon and the historical average (1989–2012) is 1,980 salmon.

The total harvest included 2,399 sockeye salmon (99%), 8 coho salmon, and 20 Chinook salmon. A total of 99 permits were issued, which is greater than the 5-year average of 83. Table 12-7 reports harvest and permit numbers according to each permittee's community of residence in 2013 for the Chitina Subdistrict. Kenny Lake, Chitina, Glennallen, McCarthy, and Copper Center had the most permits issued.

## NATIVE VILLAGE OF BATZULNETAS SUBSISTENCE FISHERY

The state created the Batzulnetas fishery in 1987 through an emergency regulation to settle the federal district court case of *John vs. Alaska*. There is also a federal permit program for a federal fishery in this area. Participants in this fishery are largely from the community of Mentasta. Legal gear includes fish wheels and dip nets in the Copper River and dip nets and spears in Tanada Creek.

For both state and federal fisheries, the open area is all waters from regulatory markers near the mouth of Tanada Creek and approximately one-half mile downstream from that mouth; and all waters of Tanada Creek between regulatory markers.

The state fishing season is open June 1–September 1 or until the season is closed by emergency order. During the season fishing periods are established by emergency order and are limited to 48 hour periods per week in June and 84-hour periods per week from July 1 till the end of the season. The federal fishing season is May 15–September 30 or until the season is closed by special action.

Since 1987, subsistence permits have been issued in 15 of the 25 years (Table 12-8). One permit was issued and returned every year from 1998 through 2004. No permits were issued for the years 2005 through 2009. Three permits were issued and returned from 2010 to 2013. The total 2013 harvest included 862 sockeye salmon and 5 Chinook salmon. The historical average (1987–2012) harvest for this fishery is 102 sockeye salmon, with the highest harvest occurring in 1994 with a take of 997 sockeye salmon.

## COPPER RIVER DISTRICT SUBSISTENCE FISHERY

### Background and Regulations

This fishery takes place in the Copper River District at the mouth of the Copper River (Copper River Flats) near the community of Cordova. Boundary lines for the Copper River District subsistence fishing are the same as for the commercial drift gillnet fishery. Permits are required to participate in subsistence fishing for salmon and freshwater fish species under the authority of 5 AAC 01.630. Permits are issued upon request either in person or by telephone to the Cordova ADF&G office. Fishers must declare their intent to fish in the Copper River Flats Area or in Prince William Sound, since the permit is valid for only one or the other location. Legal gear is set or drift gillnet no longer than 50 fathoms; open season is May 15–September 30, with additional restrictions during times of commercial fishing activity, as follows: subsistence fishing is allowed 7 days per week in the Copper River District from May 15 until 2 days before the opening of the commercial fishery. Once commercial fishing has commenced subsistence fishing is generally allowed only during commercial fishing periods. Regulations stipulate that 2 days following the closure of the Copper River District to commercial salmon fishing for the season, subsistence fishing is allowed 7 days a week until September 30. Annual limits for salmon are 15 salmon for a household of one; 30 salmon for a household of 2 or more; and 10 salmon for each additional person in the household. There is a limit of 5 Chinook salmon per permit. Other standard permit conditions

include prohibition of fishing within 300 ft. of a dam, fish ladder, weir, culvert, or other artificial obstruction.

ADF&G with the direction of the Alaska Board of Fisheries (BOF) manages salmon runs to the Copper River District to assure sustained yield to meet all user group allocations as outlined in the Copper River District Salmon Management Plan (5 AAC 24.360).

### Harvest Assessment Program

A permit program with annual subsistence salmon harvest assessments has been in place for Prince William Sound at least since 1960. Permits are returned to the Cordova ADF&G office either in person or by mail at the end of the fishing season. Permits include a harvest report, and fishers are required to record the dates fished and the number of each species of fish harvested each day.

### Subsistence Salmon Harvests in 2013

As reported in Table 12-9, 531 permits were issued for this fishery in 2013, and 497 (94%) were returned. Participation in this fishery as represented by issued permits has fluctuated over time, generally increasing from the historical average (171) and remaining somewhat consistent for the 5-year (361) and 10-year (383) averages. The estimated harvest in 2013 of 7,010 salmon was a significant increase from the previous year (4,767). The 2013 harvest was composed mainly of 6,073 sockeye salmon (87%) and included 916 Chinook salmon (13%), 18 pink salmon (<1%), 1 coho salmon (<1%) and 2 chum salmon (<1%). Most permit holders lived in Cordova (386; 73%) and took 69% of the total harvest (Table 12-10).

## EASTERN DISTRICT (TATITLEK) SUBSISTENCE SALMON FISHERY

Although the Eastern District is defined as those waters of the eastern mainland shore from the radio tower at Whitshed Village to Point Freemantle, including Bligh Island, Goose Island, and other adjacent islands (5 AAC 24.200 (c)), under regulations in place since 1988, salmon may be taken for subsistence purposes only in those waters north of a line from Porcupine Point near Goose Island to Granite Point near Glacier Island, and south of a line from Point Lowe to Tongue Point in Valdez Arm (5 AAC 01.648 (b)). The primary participants in this fishery are residents of Tatitlek. Prior to 1992, permits were issued only in Tatitlek, but since 1992, they have been issued at the Cordova ADF&G office as well. Permits may be returned in person to the Cordova ADF&G office or the Tatitlek Village Council office, or mailed at the end of the fishing season. Permits include a harvest report, and fishers are required to fill in the dates fished and the number of each species of salmon caught each day.

Legal gear for this fishery includes seines up to 50 fathoms in length and 100 meshes deep with a maximum mesh size of 4 in, or gillnets up to 150 fathoms in length with a maximum size of 6¼ in. Pink salmon may be taken in fresh water with dip nets only. The open season is May 15–October 31, under the following fishing periods: 7 days per week from May 15 until 2 days before the commercial opening of the Eastern District; during the commercial fishing season, but only during commercial openers; and 7 days per week from 2 days after the closure of the commercial season through October 31. There are no bag or possession limits for this fishery.

In 2013, there were 22 permits issued for this fishery, the most permits issued since 1988 (Table 12-11). The permittees reported a total harvest of 1,019 salmon, down slightly from the past few years but representing a general increase over the 5-year, 10-year, and historical averages. The 2013 harvest numbers align with survey efforts from 2003 (Fall 2006), indicating that until just recently, the harvest assessment program for this fishery has consistently and substantially underestimated harvests. As shown in Table 12-12, household surveys in Tatitlek provided an estimate of 1,075 salmon taken with subsistence methods in 2003, compared to the 298 salmon (Table 12-11) based on returned permits for that year. In Tatitlek, salmon for home use have also been acquired via rod and reel and removal from commercial harvests. However, all salmon that were reported harvested in the 2003 surveys were taken with subsistence nets or seines (Fall 2006).

## SOUTHWESTERN DISTRICT (CHENEGA) SUBSISTENCE SALMON FISHERY

The Southwestern District is described as the mainland waters from the outer point of the north shore of Granite Bay to Cape Fairfield, as well as the waters surrounding Knight, Chenega, Bainbridge, Evans, Elrington, and Latouche islands and their adjacent islands (5 AAC 24.200 (i)). Under regulations in place since 1988, salmon may be taken in the Southwestern District as well as in waters along the northwestern shore of Green Island from the westernmost tip of the island to the northernmost tip (5 AAC 01.648 (a)). The primary participants in this fishery are residents of Chenega Bay. Prior to 1992, permits were issued only in Chenega Bay, but since 1992, they have also been issued at the Cordova ADF&G office. Permits may be returned in person to the Cordova ADF&G office or the Chenega Village Council office, or mailed at the end of the fishing season. Permits include a harvest report, and fishers are required to fill in the dates fished and the number of each species of salmon caught each day.

Legal gear for this fishery includes seines up to 50 fathoms in length and 100 meshes deep with a maximum mesh size of 4 in, and gillnets up to 150 fathoms in length with a maximum size of 6¼ in. Pink salmon may be taken in fresh water with dip nets only. The open season is May 15–October 31 under the following fishing periods: 7 days per week from May 15 until 2 days before the commercial opening of the Southwestern District; during the commercial fishing season at the time of commercial openers; and 7 days per week from 2 days after the closure of the commercial season through October 31. There are no bag or possession limits for this fishery.

In 2013, 13 permits were issued for this fishery and 4 were returned. Both the harvest and number of permits were down from the previous years. Because permit return rates for this fishery have been low in the past, data in Table 12-13 reflect reported harvests only. The reported harvest for 2013 was 82 salmon, consisting of 19 sockeye salmon, 63 chum salmon, and 0 coho salmon. The 2013 harvest represented an increase of the reported harvest in comparison with the recent 5-year (336 salmon), 10-year (467 salmon), and historical averages (562 salmon). However, it is likely that the harvest assessment program for this fishery continues to underestimate harvests. As shown in Table 12-14, household surveys in Chenega Bay in 2003 (Fall 2006) provided an estimate of 1,690 salmon taken with subsistence methods compared to 677 (Table 12-13) based on returned permits for that same year.

## PRINCE WILLIAM SOUND: GENERAL DISTRICTS

Subsistence fishing for salmon in the other districts of the Prince William Sound Area (other than the Upper Copper River, Copper River, Eastern, and Southwestern districts; also, the Valdez Nonsubsistence Area is closed to subsistence fishing) is open in conformance with commercial fishing regulations regarding gear, open areas, and open periods. Permits are required and may be obtained from the Cordova ADF&G office. Annual limits are 15 salmon for a household of one, 30 salmon for a household of 2, and 10 salmon for each additional person in the household.

Since the creation of separate regulations for the waters fished by Tatitlek and Chenega Bay residents in 1988, it appears that participation in the general Prince William Sound fishery has been limited. In the last 22 years, issued permits have been typically low, with a 5-year average of 4 and a 10-year average of 8 (Table 12-15). In 2013, 8 permits were issued, and 8 were returned; down from the record 14 permits issued in 2012. The reported harvest for 2013 was 36 salmon, consisting of 12 sockeye salmon and 24 chum salmon. The 2013 harvest for the Prince William Sound general area is similar to the 5 and 10-year average; 42 and 37 respectively (tables 12-15 and 12-16).

## OTHER SUBSISTENCE FISHERIES IN THE PRINCE WILLIAM SOUND AREA

Subsistence halibut harvest estimates for eligible communities and tribes in the Prince William Sound Area communities of Cordova, Chenega Bay, and Tatitlek are available for 2012; no estimates are available for 2013 (Fall and Koster 2014).

In 2013, on-going harvest assessment programs did not exist for other subsistence finfish fisheries in the Prince William Sound Area. However, there is a subsistence permit available for the harvest of freshwater finfish species, which is issued out of the Glennallen ADF&G office. Also, in the Upper Copper River watershed, resident species such as Arctic grayling, burbot, and whitefishes, among other species, are harvested for home use. Harvest estimates based on household surveys are available in the CSIS.

The Division of Subsistence, in collaboration with the Copper River Native Association, the Cheesh'Na Tribal Council, the Mentasta Tribal Council, and the Chitina Tribal Council, conducted a household survey to collect nonsalmon fish harvests and use information in Copper Basin communities for a 12-month period from October 2000–September 2001. In total, 472 households were interviewed, 42% of the estimated 1,193 households living in Copper Basin communities. The study produced estimated harvests by study community and gear type for burbot, Arctic char/Dolly Varden, lake trout, Arctic grayling, northern pike, longnose suckers, rainbow/steelhead trout, and whitefishes. Detailed summaries of study methods and findings appear in Simeone and Kari (2005).

Residents of Cordova, Chenega Bay, Tatitlek, Valdez, and Whittier take a variety of shellfish and marine finfishes for subsistence uses. Harvest estimates are available in the CSIS based upon systematic household surveys. Subsistence fishing for shrimp is open April 15–September 15, with no more than 5 pots per person and 5 pots per vessel, and no bag or possession limits. The year 2006 was the first year in which a permit was not required. In March 2009, the BOF adopted a Prince William Sound Pot Shrimp Management Plan that allocated 40% of the harvestable surplus of shrimp to commercial users and 60% to noncommercial users. Harvestable surplus is estimated annually prior to the start of the fishing season (April 15) with a surplus production model that requires more timely and precise estimates of noncommercial harvest than are provided by the statewide harvest survey (SWHS). This made it necessary to reinstate the noncommercial shrimp permit prior to the start of the 2009 shrimp pot fishery season. The Prince William Sound noncommercial shrimp permit requires all noncommercial users to report the date, location, duration, number of pots, and harvest of shrimp (gallons) for each set of pot gear made throughout the fishing season (April 15–September 15). Detailed summaries of harvest estimates and data from returned permits appear in Hochhalter and Hansen (2011) for 2010. Data for 2012 is available from the ADF&G Division of Sport Fish statewide harvest survey.[2] Subsistence fishing for Dungeness, Tanner, and king crabs in the Prince William Sound Management Area was closed, either by regulation or by emergency order, due to low stock status.

# CHAPTER 13: THE SOUTHEAST REGION

## INTRODUCTION

The Southeast region is divided by subsistence regulations into 2 areas: the Southeastern Alaska Area, which includes all waters between a line projecting southwest from the westernmost tip of Cape Fairweather and Dixon Entrance, and the Yakutat Area, which includes all waters of Alaska between the longitude of Cape Suckling and the longitude of Cape Fairweather. Positive customary and traditional use (C&T) findings, which allow for subsistence fishing opportunity, have been made for most of the waters in the Southeast region (5 AAC 01.716) (Figure 13-1). In areas where no positive C&T finding exists, personal use fisheries may be authorized. In addition, the Joint Board identified 2 nonsubsistence areas in the Southeast region: the Juneau Nonsubsistence Area and the Ketchikan Nonsubsistence Area (Figure 13-1) (5 AAC 99.015). By statute, no subsistence fisheries may be authorized in nonsubsistence areas.

The Southeast region is divided into 6 areas for management purposes:

- Yakutat Management Area,
- Haines Management Area,
- Juneau Management Area,
- Sitka Management Area,
- Petersburg Management Area, and
- Ketchikan Management Area.

## HARVEST ASSESSMENT PROGRAMS

Since 1990, any Alaska resident may harvest salmon under state subsistence regulations. In the Southeast region permits are required for both subsistence and personal use salmon fishing. In most management areas, one permit is issued for both fisheries. In the Haines and Yakutat management areas, the permit is only for subsistence fisheries; no personal use fisheries are authorized in these areas. The Division of Commercial Fisheries is responsible for administering the subsistence and personal use salmon permit programs in the Southeast region. Permits are available at area offices. Department personnel or authorized designees also travel to Angoon, Hoonah, and Kake in the spring of each year to issue permits. There has been an annual salmon harvest assessment in the Southeast Alaska area since 1985, based on the permit reporting program. Permits are valid for one year and must be returned by the date specified on the permit, usually in November. New permits will not be issued to anyone who has failed to return a permit issued for the previous year. Generally, however, area management offices will accept a harvest record for the previous year at the time a person applies for a current year's permit. Annual harvest assessments did not begin in the Yakutat area until 1989. Permit information, including names, addresses and details from the harvest calendars, such as locations and amount of harvest, species harvested, and date of harvest, is entered into *Alexander: the Integrated Fisheries Database for Southeast Alaska and Yakutat*. All of the harvest information collected each year through returned permits composes the basis of the harvest assessment program in the Southeast region.

## REGULATIONS

Subsistence regulations are valid in areas where there are fish stocks with positive C&T determinations; outside of these areas personal use regulations apply. To participate in a subsistence fishery, a person must obtain a free permit for the area to be fished. To participate in personal use fisheries requires a permit as well as a valid resident sport fishing license, or to be exempt from licensing. Area management biologists have discretionary authority to change permit conditions, such as season length or possession

limits, either before the season begins or inseason, through issuing emergency orders. Permits are issued at the household level; one permit is issued per household, and the recipient must be an Alaska resident. The content of subsistence and personal use permits is a mixture of personal information about the permittee, rules and regulations governing harvesting methods and means, and a harvest calendar that details all the fish caught under each permit. Permits are not issued for the taking of coho salmon in the Taku or Stikine River drainages, or for Chinook salmon, trout or char; however, such fish taken incidentally under the conditions of a permit are legally taken and must be recorded on the permit. The personal use limits on Chinook and coho salmon are 2 and 6 fish, respectively. Other regulations concerning the subsistence and personal use fisheries can be found in 5 AAC 01 (*Subsistence Finfish*) and 5 AAC 77 (*Personal Use Fishery*). These regulations include: fishermen must record their harvests on a daily basis prior to leaving the immediate fishing area; the permit must be with the permittee, other authorized members of the household, or authorized proxy while taking or transporting subsistence salmon; the dorsal fins of subsistence salmon and both tips of the tail fin of personal use salmon must be removed immediately when taken; fishing is not allowed within 300 ft of a dam, fish ladder, weir, culvert, or other artificial obstruction; sport-caught and subsistence-caught/personal use-caught salmon cannot be possessed on the same day; salmon taken under personal use or subsistence permits cannot be used for bait, and; salmon may not be harvested for subsistence or personal use by a line attached to a rod or pole, except in the Redoubt bay and lake subsistence salmon fishery. Regulations that apply to specific management areas are included in the relevant sections below.

## SUBSISTENCE/PERSONAL USE SALMON HARVESTS IN 2013

In 2013, the total estimated subsistence and personal use salmon harvest for the Southeast region, based on returned permits, was 59,343 fish (Table 13-1). This is slightly below the total estimated harvest for 2012 (59,938 salmon) as well as the 10-year average (59,797 salmon), but above the recent 5-year average (56,792 salmon) (Table 13-2). Sockeye salmon usually make up the largest proportion of subsistence/personal use salmon catches in Southeast Alaska, in contrast to the commercial fishery, which has been dominated by pink salmon harvests since the early 1900s (Tingley and Davidson 2011). As expected, in 2013, sockeye salmon contributed the greatest amount to the overall harvest at 49,547 fish (84%), followed by 3,799 coho salmon (6%), 3,597 pink salmon (6%), 1,417 chum salmon (2%), and 983 Chinook salmon (2%) (Table 13-1; Figure 13-2). While the numbers of each species of salmon harvested differed from the 2012 harvest, the overall contribution of each species to the total harvest did not change significantly: the 2013 harvest was slightly weaker in sockeye salmon and slightly stronger in pink and Chinook salmon. Harvests of pink, coho, chum, and Chinook salmon increased over 2012 estimates; only the harvest of sockeye salmon decreased in total number. For a comparison, in the commercial fisheries in 2013, sockeye and Chinook salmon were well below their 10-year and historical averages, while coho, pink, and chum salmon harvests were well above the ten-year and historical averages (Conrad and Gray 2014). Pink salmon have exhibited a strong odd-year, weak even-year return to the commercial fisheries since 2006, and this pattern appears visible in the subsistence/personal use harvests of 2013 as well. The estimated subsistence/personal use salmon harvests by management area were as follows: Sitka 13,012 (22%), Haines 12,060 (20%), Juneau 11,282 (19%), Ketchikan 9,116 (15%), Petersburg 7,218 (12%), and Yakutat 6,655 (11%) (Table 13-3, Figure 13-3). Compared to 2012, harvests in Petersburg increased the most dramatically with 4,000 more salmon harvested in 2013; harvests in the Haines and Juneau management areas also increased by 2,000 salmon each. Harvests in Sitka, Ketchikan, and Yakutat decreased from 2012.

The number of permits issued per year, on average, for the 10-year time period of 2003–2012, has been 3,267 (Table 13-2). In 2013, a higher than average number of permits was issued, with a total of 3,564 permits issued and 3,170 returned. This corresponds to a regionwide response rate of 89%, higher than the 5- and 10-year averages of 88% and 82%, respectively. The numbers reported on the returned permits are expanded to account for the unreturned permits. Prior to 1996, only permits returned with harvest data

were included in the database and reported harvests were not expanded to account for permits not returned.

# YAKUTAT MANAGEMENT AREA

## Yakutat Area Subsistence Fisheries

### *Background and History*

The Yakutat Management Area stretches from Cape Fairweather to Cape Suckling and encompasses the Yakutat area subsistence fisheries. Fishing areas used by Yakutat residents are under the management responsibility of the Division of Commercial Fisheries' Yakutat Area offices. C&T findings by the Alaska Board of Fisheries (BOF) for salmon identify the freshwaters upstream from the terminus of streams and rivers from the Doame River to the Tsiu River, the waters of Yakutat Bay and Russell Fjord, and the waters of Icy Bay (5 AAC 01.666 (a)(3)). Unlike the other management areas, in the Yakutat Management Area subsistence salmon fishing locations are not restricted to specific streams, nor are there daily or annual limits on the number of fish harvested.

Yakutat is the only community within the Yakutat Management Area. The population of the Yakutat City and Borough did not change from 2012 and was estimated at 622 in 2013.[1]

### *Regulations*

There were no significant changes made to the subsistence permit in 2013. No daily or annual limits or restrictions to allowable subsistence gear were specified. Regulations specific to the Yakutat area were that the weekly subsistence fishing period during the commercial salmon net season was from 6:00 AM Friday to 6:00 PM Saturday. On the Situk River, subsistence fishers were required to attend their nets when they were being used to harvest salmon. In Yakutat Bay, each permit holder needed to attend their net at least once a day. An emergency order was released on May 2, 2013, which set the weekly subsistence fishery period in Yakutat Bay from 12:01 AM Wednesday through 11:59 PM Saturday, which would be in effect for the duration of the spring commercial troll fishery. [2] The order was issued to maintain separation of the fish harvested in the subsistence fishery and the commercial troll fishery. The same news release closed subsistence fishing for Chinook salmon in the Situk-Ahrnklin Inlet at 6:00 AM May 19. The order was issued because the preseason forecast of the Situk River Chinook salmon return suggested that the return would be below desired levels and conservative actions were required to limit harvest on the stock. On July 8, Chinook salmon in this area were allowed to be retained because the escapement goal had been met.[3] On May 9, 2013, another emergency order was released, which opened subsistence fishing by set gillnet in Yakutat Bay until further notice but maintained the subsistence fishing period for subsistence troll gear.[4] Subsistence fishing by all gear types in the waters of Yakutat Bay was closed on June 12 and then implemented through a weekly subsistence period from 6 AM Friday to 6:00 PM Saturday, in accordance with regulations.[5] The last news release of the season was issued on July 25, 2013, and reopened the subsistence fishery until further notice.[6]

### *Harvest Assessment Program*

The estimated total subsistence salmon harvest for the Yakutat Management Area in 2013 was 6,655 salmon, including 5,185 sockeye salmon (78%), 818 coho salmon (12%), 615 Chinook salmon (9%), 31 chum salmon (<1%), and 5 pink salmon (<1%) (Table 13-3). An estimated 115 permits were fished in the Yakutat Management Area (Table 13-3). There was no change in the number of permits fished compared to 2012; however, there was a decrease in the number of salmon harvested, particularly of sockeye salmon (8,036 salmon harvested in 2012).

Residents of Yakutat were issued 130 subsistence permits, with 109 returned (84%). The estimated total subsistence salmon harvest for the community of Yakutat in 2013 was 5,615 fish, down from 7,034 salmon in 2012. The 2013 harvest composition was 4,224 sockeye salmon (75%), 748 coho salmon (13%), 610 Chinook salmon (11%), 31 chum salmon (1%), and 2 pink salmon (<1%) (Table 13-4).

## HAINES MANAGEMENT AREA

## Haines Area Subsistence Fisheries

### *Background and History*

The Haines Management Area, encompassing the Haines area subsistence fisheries, stretches from Little Island in Lynn Canal north to Chilkat Inlet, and includes the waters of the Chilkat River, as well as the waters in the Chilkoot Inlet to Skagway. Subsistence salmon fisheries in the waters traditionally used by the residents of the Haines area are under the management responsibility of the Division of Commercial Fisheries' Haines Area office. Positive C&T findings for salmon identify all the waters of the Chilkat River and Chilkat Inlet north of the latitude of Glacier Point, and in the Chilkoot River, Lutak Inlet, and Chilkoot Inlet north of the latitude of Battery Point, excluding waters of Taiya Inlet north of the latitude of the tip of Taiya Point (5 AAC 01.716 (a)(2)).

There are several communities in the Haines Management Area: the city of Haines and surrounding borough, which includes the settlements of Covenant Life, Lutak, Mosquito Lake, Mud Bay, and Excursion Inlet, as well as Klukwan on the Chilkat River and Skagway at the head of Chilkoot Inlet. In 2013, the combined population of these communities was 3,508, which is approximately the same estimate as in 2012.[7] The populations of Haines and Skagway are predominantly non-Native, while Klukwan continues to have a predominantly Alaska Native population.

### *Regulations*

There were no changes in regulations from 2012. The permit provided for an open season of June 1–September 30 for sockeye, coho, pink, and chum salmon in the Chilkat River, Chilkat Inlet, and Lutak Inlet. Inseason, subsistence salmon fishing was extended through October 13, 2013, to allow additional subsistence harvest opportunity on late-run sockeye, chum, and coho salmon.[8] The subsistence salmon fishery in Chilkat Inlet north of Glacier Point was open the Saturday before and during and commercial drift gillnet openings through October 13. Limits for the season for sockeye salmon were 25 in possession and 50 annually; for coho salmon, 20 in possession and 40 annually; and for pink salmon, chum salmon, or a combination of the two species, 75 in possession and 100 annually.

Allowable gear types in the Haines Management Area subsistence fishery are set and drift gillnets. This gear could be used to take salmon in the mainstem and side channels, but not in the tributaries, of the Chilkat River from Mile 4 of the Haines Highway to 1 mile upstream of Wells Bridge. Drift and set gillnets could not exceed 50 ft in length when fishing in the Chilkat River, and drift gillnets fished in

7. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed May 11, 2015. http://labor.alaska.gov/research/pop/popest.htm
8. Alaska Department of Fish and Game Division of Commercial Fisheries, "Chilkat Inlet and Chilkat River subsistence salmon fishery," news release, September 26, 2013. Accessed May 8, 2015. http://www.adfg.alaska.gov/static/applications/dcfnewsrelease/366704213.pdf

marine waters could not exceed 50 fathoms in length. In the Chilkat River, fishers must attend their nets while fishing.

#### *Harvest Assessment Program*

The estimated subsistence salmon harvest in the Haines Management Area in 2013 was 12,060 salmon, including 9,158 sockeye salmon (76%), 1,639 pink salmon (14%), 607 chum salmon (5%), 473 coho salmon (4%), and 183 Chinook salmon (2%) (Table 13-3). The overall salmon harvest was almost 2,000 fish greater than the 2012 harvest. The majority of this increased harvest came from pink and sockeye salmon. An estimated 403 permits were fished in the Haines Management Area in 2013.

In the Haines Borough, 434 permits were issued and 419 were returned (97%). Permits issued to residents of the city of Haines, Mud Bay, Mosquito Lake, Covenant Life, or Lutak are included in the Haines totals. In Klukwan, 9 permits were issued and all were returned. Twenty residents of Skagway were issued permits and 18 were returned. In Excursion Inlet, 4 permits were issued and 3 were returned. The estimated salmon harvest by Haines, Klukwan, Skagway, and Excursion Inlet residents combined (10,664 salmon total) included 7,985 sockeye salmon (75%), 1,499 pink salmon (14%), 528 chum salmon (5%), 492 coho salmon (5%), and 159 Chinook salmon (1%) (Table 13-4). In 2012, 457 permits were issued and 9,339 salmon in total were reported.

## JUNEAU MANAGEMENT AREA

The Juneau Management Area encompasses subsistence fisheries in the Angoon area and the Hoonah area, as well as personal use fisheries in the Juneau area. Subsistence and personal use harvests by residents of Elfin Cove, Tenakee Springs, Gustavus, and Pelican occur primarily, but not exclusively, in the Juneau Management Area. Management responsibility for the area rests with both the Division of Commercial Fisheries' Juneau and Sitka area offices. Overall, in 2013 there were an estimated 484 permits fished in the Juneau Management Area with an estimated harvest of 11,282 (Table 13-3). About 10 more permits were issued than in 2012 and over 1,500 more fish were harvested. Sockeye salmon harvests constituted 92% of the total harvest.

### Angoon Area Subsistence Fisheries

#### *Background and History*

Subsistence salmon fisheries in the waters traditionally used by the residents of Angoon are under the management responsibility of the Division of Commercial Fisheries' Juneau and Sitka area offices. In 1989, the BOF adopted a positive C&T finding for salmon in the waters of District 12 south of a line from Fishery Point to South Passage Point and north of the latitude of Point Caution, and in waters of Section 13C east of the longitude of Point Elizabeth (5 AAC 01.716 (a)(6)).

The residents of Angoon are the principal subsistence fishers in this area. In 2013, Angoon had a population of 438, continuing a slightly decreasing trend.[9] Angoon Tlingit have traditionally used most of the west coast of Admiralty Island, from Hawk Inlet to the southern tip of Admiralty Island, and lands and waters of the east coasts of Chichagof and Baranof islands. Based on permit data from 1996 through 2006, as well as interviews with local fishers, the waters of Kootznahoo Inlet, Favorite Bay, and Hood Bay to the south; Mitchell Bay, Salt Lake, and Kanalku bays further east; and Chatham Strait to the west continue to provide the people of Angoon with salmon and other marine resources.

#### *Regulations*

The 2013 permit conditions did not differ from 2012. The open season for sockeye salmon in Kanalku Bay and Basket Bay (Kook Lake outlet) was from June 1–July 31, with a limit of 20 fish in possession and annually at Kanalku Bay, and 15 fish in possession with an annual limit of 30 fish in Basket Bay; in

9. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed May 11, 2015. http://labor.alaska.gov/research/pop/popest.htm

Sitkoh Bay from June 1–August 31, with a possession and annual limit of 50 fish; and in Hasselborg River–Salt Lake from July 1–August 15, with a limit of 25 fish in possession and annually. The open period for subsistence coho salmon fishing on Hasselborg River–Salt Lake was from July 1–October 31 with a possession and annual limit of 20 fish. Coho salmon could also be taken in other streams in the Angoon area with positive C&T findings from June 1–October 31, with limits of 20 in possession and 40 annually from all combined streams. Pink salmon could be harvested in all streams in the area from June 1–September 30, with a possession and annual limit of 150 fish. The season for chum salmon in all streams of the area was from June 1–October 31, and the possession and annual limit was 50 fish. Gaffs, spears, beach seines, dip nets, drift gillnets, and cast nets were the allowable subsistence gear types. Drift gillnets could not exceed 50 fathoms in length.

#### *Harvest Assessment Program*

The estimated salmon harvest in the Angoon area subsistence fisheries in 2013 was 1,513 salmon, including 1,435 sockeye salmon (95%), 44 pink salmon (3%), 28 coho salmon (2%), and 6 chum salmon (<1%) (Table 13-3). The 2013 salmon harvest was similar to the 2012 harvest, but the relative contributions of each species to the overall harvest changed. Sockeye salmon harvests increased the most, with decreases of a similar magnitude in Chinook, pink, and coho salmon harvests. An estimated 47 permits were fished in the area, compared to 54 permits fished in 2012.

The estimated salmon harvest for the community of Angoon in 2013, based on 96 permits issued and 77 returned (80%), totaled 1,182 salmon, including 1,156 sockeye salmon (98%), 19 coho salmon (2%), and 7 pink salmon (1%) (Table 13-4). Not all permits were fished solely in the Angoon area. The number of permits issued in Angoon in 2013 was similar to the number issued in 2012, with a slightly smaller harvest. There was a higher percentage of sockeye salmon caught, although the total number of sockeye salmon caught was less than in 2012 (1,410). The harvest of coho and pink salmon also declined.

### Hoonah Area Subsistence Fisheries

#### *Background and History*

Subsistence salmon fisheries in the waters traditionally used by the residents of Hoonah are under the management responsibility of the Division of Commercial Fisheries' Juneau and Sitka area offices. In 1989, the BOF adopted a positive C&T finding for salmon in those waters of District 12 that are in Basket Bay west of 134º 53.88′ W. longitude; in those waters of District 13 that are along the western shore of Yakobi Island east of a line from Cape Spencer light to Surge Bay light; and in the waters of sections 14B and 14C (5 AAC 01.716 (a)(4)).

The residents of Hoonah are the principal subsistence users of the waters in the area. In 2013, Hoonah had a population of 797, continuing a slightly increasing trend in population estimates since 2010.[10]

#### *Regulations*

No changes were made to the 2012 subsistence salmon permit for the Hoonah area. It provided open seasons and limits for sockeye salmon at the following locations: Surge Bay, Hanus Bay (Lake Eva), and Neva Creek from June 1–August 15; Hoktaheen Cove from June 1–July 20; and Berg Bay from June 1–July 31. Limits at these locations varied: 50 sockeye salmon annually and in possession were allowed at Surge and Hanus bays and at Hoktaheen Cove; a limit of 40 fish in possession and annually was in effect at Neva Creek; and Berg Bay had a limit of 25 fish annually and in possession. Pink salmon could be harvested under a subsistence permit in all streams in the Hoonah area from June 1–September 30, with a possession and annual limit of 150 fish. Chum salmon could be harvested in the same waters from June 1–October 31, with a possession and annual limit of 50 fish. Coho salmon could be taken in streams in the areas with positive C&T findings from June 1–October 31, with limits of 20 in possession and 40

10. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed July 2014. http://labor.alaska.gov/research/pop/popest.htm

annually. Gaffs, spears, beach seines, dip nets, drift gillnets, and cast nets were the types of subsistence gear allowed in the Hoonah area subsistence fisheries. Drift gillnets could not exceed 50 fathoms in length.

### *Harvest Assessment Program*

The estimated salmon harvest in the Hoonah area subsistence fisheries in 2013 was 2,231 salmon, including 1,979 sockeye salmon (89%), 121 pink salmon (5%), 72 coho salmon (3%), and 58 chum salmon (3%) (Table 13-3). The 2013 harvest was about 1,000 salmon more than the 2012 harvest. The majority of this increase came from harvests of sockeye salmon, which increased from 969 fish in 2012. An estimated 83 permits were fished in the Hoonah area in 2013 in comparison to 54 permits fished in 2012.

For the community of Hoonah, in 2013, 101 permits were issued and 83 were returned (82%) with a total estimated harvest of 848 salmon. Not all permits were fished solely in the Hoonah area. The harvest consisted of 624 sockeye salmon (74%), 134 pink salmon (16%), 52 chum salmon (6%), and 37 coho salmon (4%). No Chinook salmon were harvested (Table 13-4). Fewer permits were issued to Hoonah residents compared to 2012, but a greater percentage of those permits were returned. The overall harvest was lower than in 2012, by more than 1,000 salmon, with decreases in all harvests, but most noticeably in sockeye salmon, which was estimated at 1,543 salmon in 2012.

## Elfin Cove, Gustavus, Pelican, and Tenakee Springs Subsistence and Personal Use Salmon Fisheries

### *Background*

Subsistence and personal use salmon fisheries in the waters traditionally used by the residents of Elfin Cove, Gustavus, Pelican, and Tenakee Springs are under the management responsibility of the Division of Commercial Fisheries' Juneau and Sitka area offices. Fishers from these communities fish primarily in districts 11, 12, 13, and 14; harvests are included in the Angoon area subsistence fisheries, Hoonah area subsistence fisheries, and Juneau area personal use fisheries categories in Table 13-3. Elfin Cove fishers harvest salmon from Hoktaheen Cove in District 13. Gustavus fishers harvest salmon primarily from Surge Bay and Hoktaheen Cove in District 13, but also from the Taku River in District 11, the Berg River in District 14, and the Chilkat River in District 15. Residents of Pelican and Tenakee Springs harvest salmon at Kook Creek and Kook Lake Outlet in Basket Bay, and Takanis Bay and Hoktaheen Cove in District 13. Most of the salmon stocks in these areas have positive C&T findings as described in other sections of this report.

In 2013, Elfin Cove had a population of 16; Gustavus–501 residents; Pelican–79 residents; and Tenakee Springs–140 residents.[11] The population of each community, with the exception of Gustavus, decreased slightly over 2012 estimates.

### *Regulations*

Permit regulations applying to fishers in this area can be found under the Hoonah, Angoon, Haines, and Juneau subsections.

### *Harvest Assessment Program*

In 2013, the number of salmon reported on permits issued to residents of Elfin Cove, Gustavus, Pelican, and Tenakee Springs was modest (Table 13-4). One permit was issued but not returned in Elfin Cove. In Gustavus, 29 permits were issued and 28 were returned. The estimated harvest for Gustavus was 304 total salmon, a significant increase from 2012, when 88 fish were reported. The harvest consisted of 284 sockeye salmon (94%), 15 pink salmon (5%), 2 chum salmon (1%) and 1 coho salmon (<1%). Two

11. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed May 11, 2015. http://labor.alaska.gov/research/pop/popest.htm

permits were issued to Pelican residents and two to Tenakee Springs residents; all were returned. Estimated harvests for these 2 communities were 30 salmon, about half the harvest of 2012. All fish harvested were sockeye salmon (Table 13-4).

## Juneau Area Personal Use Fisheries

Juneau fishers primarily harvest sockeye salmon from the Taku River and Sweetheart Creek in District 11, which is in the Juneau Nonsubsistence Area (Figure 13-1). These waters are under the management responsibility of the Division of Commercial Fisheries' Juneau Area office. Personal use regulations apply to salmon fishing for home uses in this area. Juneau area residents were the principal participants in the designated personal use fisheries in District 11. In 2013, the city and borough of Juneau had a population of 33,030, an increase of approximately 200 residents over 2012.[12]

### *Regulations*

The 2013 personal use permit conditions remained the same as 2012. The permit provided open seasons and limits for sockeye salmon at the following locations: in the Taku River from July 1–July 31, with a possession and annual limit of 5 sockeye salmon for a household of 1 person and 10 sockeye salmon for a household of 2 or more people; and in Sweetheart Creek from June 1–October 31, with a possession limit of 25 sockeye salmon and no annual limit. In all streams in the Juneau Management Area, except along the Juneau road system, the open season for pink salmon was June 1–September 30 with a 150 fish limit annually and in possession; for chum salmon, the open season was June 1–October 31 with an annual and possession limit of 50 fish.

Beach seines, set and drift gillnets, cast nets, dip nets, gaffs, and spears were the types of personal use gear allowed in the Juneau area. Drift gillnets could not exceed 50 fathoms in length. Set gillnets could be used only in the Taku River, where they could not exceed 15 fathoms in length, had to be set from the Taku River Lodge upstream to the U.S.–Canada border, and could not be fished within 100 yd of the ADF&G fish wheels. Additionally, the permit holder had to be present at the net while it was in use. In Sweetheart Creek, salmon could be taken for personal use only upstream from the ADF&G regulatory marker located near the stream mouth. Chinook and coho salmon, rainbow/steelhead trout, and Arctic char/Dolly Varden could be retained only if taken incidentally under a personal use permit.

### *Harvest Assessment Program*

The total estimated salmon harvest for the Juneau area personal use fisheries in 2013 was 7,537 salmon, consisting of 6,997 sockeye salmon (93%), 223 pink salmon (3%), 264 coho salmon (4%), 30 chum salmon (<1%), and 23 Chinook salmon (<1%) (Table 13-3). This was a slightly higher harvest than 2012. Sockeye, coho, and chum salmon harvests increased, while harvests of Chinook and pink salmon declined. An estimated 402 permits were fished in the Juneau area personal use fisheries in 2013, compared to 367 permits fished in 2012.

The estimated personal use and subsistence salmon harvest for the community of Juneau (including the communities of Douglas and Auke Bay), based on 793 permits issued and 719 returned (91%), totaled 11,252 salmon, including 10,275 sockeye salmon (91%), 389 pink salmon (3%), 358 coho salmon (3%), 180 chum salmon (2%), and 50 Chinook salmon (<1%) (Table 13-4). Not all permits were fished solely in the Juneau area. More permits were issued and returned in 2013 than in 2012. Overall salmon harvests were greater in 2013: harvests of sockeye, chum, and pink salmon increased while coho and Chinook salmon harvests decreased slightly.

12. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed May 11, 2015. http://labor.alaska.gov/research/pop/popest.htm

# SITKA MANAGEMENT AREA

## Sitka Subsistence and Personal Use Salmon Fisheries

### *Background and History*

Subsistence and personal use salmon fisheries in the waters traditionally used by the residents of Sitka are under the management responsibility of the Division of Commercial Fisheries' Sitka Area office. In 1989, the BOF adopted a positive C&T finding for sockeye salmon in in those waters of District 13 that were along the western shore of Yakobi Island east of a line from Cape Spencer light to Surge Bay light (5 AAC 01.716 (a)(4)) as well as the waters of Section 13A south of the latitude of Cape Edward, in waters of Section 13B north of the latitude of Redfish Cape, and in waters of Section 13C (5 AAC 01.716 (a)(8)). At the March 1997 BOF meeting in Sitka, this finding was extended to include all other salmon species in all waters of District 13 (5 AAC 01.716 (a)(21)). Sockeye salmon stocks without a positive C&T finding in this area can only be fished under personal use regulations, not subsistence regulations. Principal salmon waters and streams used by Sitka fishers include Klag Bay–Lake Anna, Lake Stream–Ford Arm, Necker Bay, Redoubt Bay, Salmon Lake, and Redfish Bay.

The residents of Sitka are the principal subsistence users of the salmon stocks in the area. In 2013, the city and borough of Sitka had a population of 9,034.[13] The Sitka Tlingit have traditionally used most of the Pacific coast of Baranof and Chichagof islands from Point Urey to Cape Ommaney, including the myriad islands lying off the coast, and up Peril Strait between Chichagof and Baranof islands into Hoonah Sound as far as Patterson Bay. Sitkans share the use of Yakobi Island and the sockeye salmon fisheries at Hoktaheen Cove and Surge Bay with the residents of Hoonah. Sitka residents' territory touches that of Angoon residents' in Peril Strait and Sitkoh Bay.

### *Regulations*

Specific conditions on the 2013 subsistence/personal use salmon permit remained the same as in 2012. The season for sockeye salmon for all Sitka locations opened June 1 and closed between July 13 and August 31. As stated on the permit, Falls Lake and Bay closed on July 13, but was open again from July 23 to August 15. On July 20, Hoktaheen Cove, Takanis Bay, and Gut Bay closed to sockeye salmon fishing. Leo's Anchorage closed on July 25. On July 31, Silver Bay, Politofski Lake, and other unlisted areas with positive C&T findings closed to subsistence/personal use fishing. On August 15, Klag and Surge bays, Lake Anna, Ford Arm, and Hanus Bay (Lake Eva) closed. The last areas closed on August 31 and included Necker, Redfish, Redoubt, and Sitkoh bays.

Possession and annual limits for sockeye salmon varied from 10 fish in possession and annually at Leo's Anchorage and Silver Bay to 100 fish in possession and annually at Necker Bay. Sitkoh, Takanis, Surge, Klag, and Hanus bays, Hoktaheen Cove, and Politofski Lake had possession and annual limits of 50 sockeye salmon. Lake Anna, Ford Arm, Falls Lake, and Falls Bay had possession and annual limits of 25 fish. Redfish Bay had limits of 50 in possession and 100 fish annually. Gut Bay limits were 10 fish in possession and 20 fish annually. For subsistence/personal use locations not listed on the permit, the possession limit and annual limit was 10 sockeye salmon. Redoubt Bay had a possession limit of 10 fish with an annual limit of 50, but this was altered inseason by an emergency order as discussed below.

In January 2003, the BOF adopted the *Redoubt Bay and Lake Sockeye Salmon Management Plan* (5 AAC 01.760). The plan provides a management approach for subsistence, sport, and commercial fisheries that target Redoubt Lake sockeye salmon based on an optimal escapement goal of 7,000–25,000 fish. As specified on the permit, by default the fishery is open from June 1–August 31 with a possession limit of 10 fish and an annual limit of 50 fish. If the projected run falls below 7,000 fish or above 10,000 fish, the season or limits will change inseason. In 2013, the projected escapement for the season exceeded

13. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed May 11, 2015. http://labor.alaska.gov/research/pop/popest.htm

30,000 sockeye salmon. In accordance with the plan, an emergency order was published on June 27, 2013, which increased the subsistence possession limit for sockeye salmon to 25 fish with an annual limit of 100.[14]

Salmon streams flowing across or adjacent to the Sitka road system were closed to subsistence/personal use fishing for coho and chum salmon. The season for chum salmon in other waters with positive C&T findings within the Sitka Management Area, except for the listed sockeye salmon streams, was July 15–October 31, with a possession and annual limit of 50 fish. Coho salmon within the Sitka Management Area could be taken under subsistence fishing permit conditions from August 16–October 31 and in Redoubt, Necker, Redfish, and Sitkoh bays from September 1–October 31 with a possession limit of 20 fish and an annual limit of 40 fish for any combination of streams. Pink salmon within the Sitka Management Area, except those sockeye salmon streams listed on the permit, could be taken under subsistence fishing permit conditions from July 15–September 30, with a possession limit of 50 fish and annual limit of 150.

Allowable subsistence gear for all areas except for Redoubt Bay included hand purse seines, beach seines, drift gillnets, dip nets, cast nets, gaffs, and spears. Drift gillnets could not exceed 50 fathoms. Cast nets were allowed in all areas except Redoubt Bay. In Redoubt Bay only, the use of rod and reel gear was allowed as subsistence gear and limitations listed in sport regulations applied to this gear. Portions of Falls Lake, Gut Bay, Silver Bay, and Indian River had closed areas and/or restricted gear types specified on the permit.

### *Harvest Assessment Program*

As reported in Table 13-3, the estimated salmon harvest in the Sitka Management Area subsistence and personal use fisheries in 2013 was 13,012 salmon, consisting of 12,389 sockeye salmon (95%), 258 pink salmon (2%), 246 coho salmon (2%), 112 chum salmon (1%), and 7 Chinook salmon (<1%). This was a decrease from the 2012 harvest estimate of 15,650 fish; contributions of each species to the overall harvest remained similar, but the harvest of most species decreased, except for pink and chum salmon. An estimated 419 permits were fished in the Sitka Management Area in 2013, compared to 449 permits in 2012.

As reported in Table 13-4, the estimated salmon harvest for the community of Sitka in 2013, based on 684 permits issued and 608 returned (89%), was 12,617 salmon, including 12,003 sockeye salmon (95%), 250 pink salmon (2%), 246 coho salmon (2%), 112 chum salmon (1%), and 7 Chinook salmon (<1%). Not all permits were fished solely in the Sitka Management Area. The number of permits issued and returned increased from 2012, but harvests decreased, particularly for sockeye and coho salmon. Chinook salmon also decreased by approximately half, while pink and chum salmon harvests increased.

## PETERSBURG MANAGEMENT AREA

The Petersburg Management Area includes the Kake area subsistence fisheries, the Petersburg–Wrangell area personal use fisheries, the federal Stikine River subsistence fishery, and the Point Baker–Port Protection area subsistence fisheries. Overall, an estimated 316 state subsistence permits were fished in the Petersburg Management Area in 2013. The total estimated salmon harvest was 7,218 fish, with 80% of the harvest coming from sockeye salmon (Table 13-3). More permits were fished in 2013 and more salmon were harvested (185 permits in 2012 with a harvest of 3,280 salmon).

14. Alaska Department of Fish and Game Division of Commercial Fisheries, "Redoubt Bay and Lake subsistence and sport sockeye salmon fishery announcement," news release, June 27, 2013. Accessed May 8, 2015. http://www.adfg.alaska.gov/static/applications/dcfnewsrelease/296407933.pdf

## Kake Area Subsistence Fisheries

### *Background and History*

Subsistence salmon fisheries in the waters traditionally used by the residents of Kake are under the management responsibility of the Division of Commercial Fisheries' Petersburg Area office. In 1989, the BOF adopted a positive C&T finding for salmon in the waters of sections 9A and 9B north of the latitude of Swain Point, in the waters of District 10 west of a line from Pinta Point to False Point Pybus, and in the waters of District 5 north of a line from Point Barrie to Boulder Point (5 AAC 01.716 (a)(10)). Principal salmon waters and streams used predominately by Kake fishers include Gut Bay and Falls Lake Creek on the southwest coast of Baranof Island, as well as Saginaw, Security (Salt Lake), Pillar (Kutlaku Creek), and Tebenkof (Alecks Creek) bays on Kuiu Island.

In 2012, Kake had a population of 621, an increase of about 20 residents over 2012.[15] Kake residents shared the use of the southern coastal waters of Admiralty Island with residents of Angoon and Petersburg. In recent years, principal subsistence salmon fishing by Kake residents has occurred in Gut Bay and Falls Creek on Baranof Island, and at Kutlaku Creek in Pillar Bay.

### *Regulations*

Discretionary permit conditions did not change from 2012. The 2013 subsistence salmon permit provided for an open season for sockeye salmon in Alecks Creek and Shipley Bay of June 1–July 31. In the former stream, harvest limits were set at 50 salmon in possession and annually. In the latter area, the possession limit was 25 fish and the annual limit was 50 fish. In Bay of Pillars, the open season was from June 1–August 15 with annual and possession limits of 50 fish. For Falls Lake, the open seasons were June 1–July 13 and July 23–August 15 with possession and annual limits of 25 fish. The season for sockeye salmon in Gut Bay was June 1–July 20 with a limit of 10 fish in possession and 20 fish annually. Pink, chum, and coho salmon could be harvested in all streams in the Kake area, except for the sockeye salmon streams identified on the permits. The open season for pink salmon was July 15–September 15, and there was a possession limit of 100 pink salmon and no annual limit. Chum salmon could be harvested from July 1–October 31, and there was a possession limit of 50 fish and no annual limit. The coho salmon season lasted from August 16–October 31, and there was a limit of 20 fish in possession and 40 fish annually.

Permitted subsistence gear included gaffs, spears, beach seines, dip nets, drift and set gillnets, and cast nets. Set gillnets could be used only in Shipley Bay within 100 yd of the terminus of Shipley Creek, and the permit holder was required to be physically present at the net while in operation. Drift gillnets could not exceed 50 fathoms in length.

### *Harvest Assessment Program*

As reported in Table 13-3, the estimated salmon harvest in the Kake area subsistence fisheries in 2013 was 2,061 salmon, including 1,899 sockeye salmon (92%), 77 coho salmon (4%), 38 pink salmon (2%), 25 Chinook salmon (1%), an 22 chum salmon (1%). An estimated 85 permits were fished in the Kake area subsistence fisheries in 2013.This compares to 53 permits issued in 2012 with a total harvest of 950 salmon.

The estimated subsistence salmon harvest for the community of Kake in 2013, based on 162 permits issued and 138 returned (85%), was 2,004 salmon. The harvest consisted of 1,869 sockeye salmon (93%), 50 coho salmon (3%), 38 pink salmon (2%), 25 Chinook salmon (1%), and 22 chum salmon (1%) (Table 13-4). Not all permits were fished solely in the Kake area. More permits were issued in 2013 than in 2012 and the total harvest increased from an estimated 2012 harvest of 1,235. The largest increase was seen in

15. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed May 11, 2015. http://labor.alaska.gov/research/pop/popest.htm

sockeye salmon. Coho salmon harvests also increased, while harvests of the remaining 3 species decreased.

## Petersburg–Wrangell Area Subsistence/Personal Use Fisheries

### *Background and History*

Subsistence and personal use salmon fisheries in the waters traditionally used by the residents of Wrangell and Petersburg are under the management responsibility of the Division of Commercial Fisheries' Petersburg Area office. In 1989, the BOF adopted a positive C&T finding for salmon in many of the waters of Southeast Alaska. At that time, the BOF did not act on proposals requesting a positive C&T finding for salmon in the waters of districts 7 and 8, the principal waters used by Petersburg and Wrangell residents. In 2002, however, the BOF made a positive C&T finding for salmon stocks in these districts (5 AAC 01.716 (a)(23)). These waters include Thoms Place, Harding River, Mill Creek, and the Stikine River. Some salmon stocks in this area still do not have a positive C&T finding; these can be fished under personal use regulations.

Petersburg and Wrangell residents are the principal users of the salmon stocks of Salmon Bay on Prince of Wales Island, as well as Crystal Creek, Thoms Creek, Earl West Cove, Mill Creek, and the Stikine River. In 2013, the population of Petersburg was 2,954 and that of Wrangell was 2,453.[16] Both estimates are similar to the 2012 estimates.

### *Regulations*

Few changes were made to the discretionary permit conditions from 2012. The 2013 permit provided an open season (June 1–July 31) for subsistence sockeye salmon in Shipley, Salmon, and Red bays, along with Thoms Place and Mill Creek. Limits for sockeye salmon were 25 in possession and 50 annually from Shipley Bay and 30 in possession and annually from Salmon Bay and Red Bay, combined. Thoms Place and Mill Creek had a combined possession limit of 20 fish and an annual limit of 40 fish.

For all streams in the Wrangell and Petersburg areas with positive C&T findings, except the sockeye salmon locations listed on the permit, subsistence fishing for pink, chum, and coho salmon was permitted. The open season for subsistence pink salmon fishing was July 15–September 15, with a daily possession limit of 100 pink salmon and no annual limit. The open season for subsistence chum salmon fishing was July 1–October 31, with a daily possession limit of 50 fish and no annual limit. Subsistence coho salmon was permitted from August 16–October 31, with a limit of 20 fish in possession and 40 annually.

Allowed subsistence and personal use gear included gaffs, spears, beach seines, dip nets, drift and set gillnets, and cast nets. Drift gillnets could not exceed 50 fathoms in length. Set gillnets could be used only in Shipley Bay within 100 yards of the terminus of Shipley Creek, and the permit holder was required to be physically present at the net while in operation. A federal subsistence permit was needed to fish the Stikine River.

Personal use regulations establish a weekly sockeye salmon season at Hatchery Creek, which drains into Sweetwater Lake. The fishery was open only Thursdays through Sundays from June 1–June 30. In 2013, harvest limits were restricted to 3 fish daily and 9 annually. In 2013, this fishery was closed inseason on June 23 due to low sockeye salmon returns.[17] Personal use coho salmon fishing was open in Blind Slough and North Wrangell Narrows on Fridays from 6:00 AM to 8:00 PM from August 16 to September 6 with possession and annual limits of 25 fish. The Anita Bay personal use permit allowed the harvest of Chinook, chum, and coho salmon May 1–October 31 with possession and annual limits of 25 fish in any

16. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed May 11, 2015. http://labor.alaska.gov/research/pop/popest.htm

17. Alaska Department of Fish and Game Division of Commercial Fisheries, "Hatchery Creek personal use fishery closure," news release, June 21, 2013. Accessed May 11, 2015. http://www.adfg.alaska.gov/static/applications/dcfnewsrelease/290051068.pdf

combination. Outside of this area and Blind Slough, the possession limit was 6 coho salmon. Salmon could be taken only by drift gillnets in the Anita Bay Terminal Harvest Area.

### *Harvest Assessment Program*

The estimated salmon harvest in the Petersburg area subsistence/personal use fisheries in 2013 was 1,854 salmon, including 1,231 sockeye salmon (66%), 572 coho salmon (31%), 27 pink salmon (1%), 23 chum salmon (1%), and 1 Chinook salmon (<1%) (Table 13-3). Compared to 2012, there was an increase in the overall estimated harvest, coming from an increase in the estimated harvest of sockeye and coho salmon. Harvests of the other species was consistent with 2012 levels. As has been seen in years past, the Petersburg area subsistence/personal use fisheries show a much lower reliance on sockeye salmon that any other fishery. An estimated 86 permits were fished in 2013.

As reported in Table 13-4, the estimated subsistence/personal use salmon harvest for the community of Petersburg in 2013, based on 194 permits issued and 184 returned (95%), was 2,682 salmon, including 1,913 sockeye salmon (71%), 615 coho salmon (23%), 73 pink salmon (3%), 43 chum salmon (2%), and 38 Chinook salmon (1%). Not all permits were fished solely in the Petersburg area. About 100 more permits were issued in 2013 and the overall harvest of salmon was also higher than the 2012 estimate of 1,207 fish. More of each salmon species was harvested in 2013, with the biggest increase coming from sockeye salmon harvests.

As shown in Table 13-3, the estimated salmon harvest in the Wrangell area subsistence/personal use fisheries in 2013 was 1,118 salmon, which included 984 sockeye salmon (88%), 67 pink salmon (6%), 46 chum salmon (4%), 17 Chinook salmon (2%), and 4 coho salmon (<1%). Compared to the 2012 harvest estimate of 798 salmon, the estimated overall harvest, as well as that of every species save chum and coho salmon, increased. An estimated 68 permits were fished in 2013.

The estimated subsistence salmon harvest for the community of Wrangell in 2013, based on 189 permits issued and 181 returned (96%), was 2,492 salmon, including 1,955 sockeye salmon (78%), 174 coho salmon (7%), 169 pink salmon (7%), 113 chum salmon (5%), and 81 Chinook salmon (3%) (Table 13-4). Not all permits were fished solely in the Wrangell area. Harvests were greater than the estimated 2012 harvest of 732 fish, both in overall numbers and in numbers of each species harvested. Sockeye salmon harvests increased by more than 1,000 fish, but their contribution to the overall harvest decreased. Harvests of Chinook, coho, and pink salmon increased by a factor of 10 or more.

## 2013 Federal Stikine River Subsistence Salmon Fishery: Regulations

In January 2004, the U.S. and Canada negotiated a modified Pacific Salmon Treaty that allowed for a U.S. subsistence salmon fishery on the Stikine River. The Federal Subsistence Board implemented a Stikine River subsistence sockeye salmon fishery in 2004, followed by directed Chinook and coho salmon subsistence fisheries authorized in 2005. Regulatory changes implemented for the 2006 season included an increase in the mesh size of gillnets during the Chinook salmon fishery and an earlier starting date for the sockeye salmon fishery. In 2008, 2 additional regulatory changes were made: subsistence fishing permits became valid for the entire season (May 15–October 1); and the start date of the coho salmon fishery was moved up to August 1. The latter change allowed a continuous subsistence fishery throughout the season. There were no changes in subsistence fishing regulations or permit conditions for the 2013 fishing season. The department's preseason forecast was for low abundance, resulting in an emergency closure of the Chinook salmon subsistence fishery. On June 15, once the inseason return estimate provided for an allowable catch, the subsistence fishery was opened.

### *Current Federal Regulations*

The federal subsistence fisheries regulatory year begins April 1. Regulations are detailed in Subpart C and D of the *Code of Federal Regulations* (36 CFR part 242 and 50 CFR part 100). The sections relevant to the Stikine River are as follows:

50 CFR 100.24 Customary and traditional use determinations.

(2) Fish determinations. The following communities and areas have been found to have a positive customary and traditional use determination in the listed area for the indicated species:

Southeastern Alaska Area:

District 8 and waters draining into that District: Salmon, Dolly Varden, trout, smelt, and eulachon. Residents of drainages flowing into Districts 7 & 8, residents of drainages flowing into District 6 north of the latitude of Point Alexander (Mitkof Island), and residents of Meyers Chuck.

36 CFR 242.27 Subsistence taking of fish.

(e) Fishery management area restrictions.

(13) Southeastern Alaska Area.

(xiii) You may take Chinook, sockeye, and coho salmon in the mainstem of the Stikine River only under the authority of a Federal subsistence fishing permit. Each Stikine River permit will be issued to a household. Only dip nets, spears, gaffs, rod and reel, beach seine, or gillnets not exceeding 15 fathoms in length may be used. The maximum gillnet mesh size is 5½ inches, except during the Chinook season when the maximum gillnet mesh size is 8 inches.

(A) You may take Chinook salmon from May 15 through June 20. The annual limit is 5 Chinook salmon per household.

(B) You may take sockeye salmon from June 21 through July 31. The annual limit is 40 sockeye salmon per household.

(C) You may take coho salmon from August 1 through October 1. The annual limit is 20 coho salmon per household.

(D) You may retain other salmon taken incidentally by gear operated under terms of this permit. The incidentally taken salmon must be reported on your permit calendar.

(E) The total annual guideline harvest level for the Stikine River fishery is 125 Chinook, 600 sockeye, and 400 coho salmon. All salmon harvested, including incidentally taken salmon, will count against the guideline for that species.

Seasons, harvest limits, and the C&T determinations enumerated in regulations are also included on the federal subsistence fishing permit for the Stikine River. In addition, the permit specifies several other limitations:

- allowable gear—Gillnets not exceeding 15 fathoms in length may be used. The maximum gillnet mesh size is 5 1/2 inches, except during the Chinook season when the maximum gillnet mesh size is 8 inches;
- size—"Jack" Chinook salmon are defined as less than 28 inches. Only Chinook salmon equal to or greater than 28 inches are included in the annual harvest limit. Fishers must indicate the number of Chinook salmon taken that are greater than and less than 28 inches separately.
- harvest recording—Fishers may retain other salmon taken incidentally; however, they must be recorded on the permit.

The total annual harvest level for the Stikine River is controlled by the inseason manager and may be closed or expanded by special action.

### *Harvest Assessment Program*

For Chinook, coho, and sockeye salmon fisheries harvest assessment, a telephone-based monitoring program is used inseason, with permits and harvest reporting used for overall harvest assessment

postseason. In 2013, 124 fishing permits were issued, with approximately 56% going to Wrangell households and 44% to Petersburg households. An estimated 77 permits were fished. In 2012, 130 permits were issued, with 65% going to Wrangell households. Year-end harvest reports were obtained from all but seven permit holders. The Stikine River subsistence harvest totaled 2,185 salmon, well above the 2012 harvest amount and the 5-year average harvest (Table 13-6). The 2013 harvest consisted of 1,655 sockeye salmon (76%), 186 coho salmon (9%), 156 pink salmon (7%), 101 Chinook salmon (5%), and 87 chum salmon (4%) (Table 13-3). There were also 15 Dolly Varden char and 2 steelhead trout harvested.[18] Compared to 2012, a similar number of permit holders caught more salmon overall. Most of the increase came from the harvest of sockeye salmon, which rose from a 2012 estimate of 1,302 sockeye, but harvests of each salmon species increased over 2012. The proportion of the catch contributed by each species changed slightly, with sockeye salmon contributing less overall. The first Chinook salmon and the first sockeye salmon were harvested on June 17 and the first coho salmon was harvested on June 30.[19]

Residents of Petersburg were issued 55 permits in 2013; all were returned. Based on the permit data, residents of Petersburg harvested 860 salmon in the federal fishery, approximately 40% of the entire harvest. The catch comprised 721 sockeye salmon (84%), 44 pink salmon (5%), 38 coho salmon (4%), 37 Chinook salmon (4%), and 20 chum salmon (2%) (Table 13-5). In Wrangell, based on 69 permits issued and returned, 1,325 salmon were harvested. The catch consisted of 934 sockeye salmon (70%), 148 coho salmon (11%), 112 pink salmon (8%), 67 chum salmon (5%), and 64 Chinook salmon (5%) (Table 13-5).

## Point Baker–Port Protection Subsistence Fisheries

### *Background and History*

The Division of Commercial Fisheries' Petersburg Area office manages subsistence and personal use salmon fisheries in the waters used by fishers from the communities of Point Baker and Port Protection. These fishers rely especially on the Salmon Bay and Red Bay sockeye salmon stocks at the northern end of Prince of Wales Island. In 1989, when the BOF adopted a positive C&T finding for salmon in some waters of Southeast Alaska, it did not act on proposals to make a similar finding for the principal waters used by Point Baker and Port Protection residents. In 1997, however, the BOF did adopt a positive C&T finding for salmon and other fishes in the waters of District 5 north of a line from Point St. Albans to Cape Pole, in the waters of Section 6A west of a line from Macnamara Point to Mitchell Point, and in the waters of Section 6B west of the longitude of Macnamara Point (5 AAC 01.716 (a)(20)). Harvests in these waters are included in the Petersburg area subsistence-personal use fisheries category in Table 13-3.

In 2013, Point Baker had a population of 15 and Port Protection had a population of 57, a significant increase over 2012, when the estimate was 42 residents.[20]

### *Regulations*

The Point Baker drift gillnet subsistence sockeye salmon fishery occurs in the waters of Sumner Strait within 3 miles of the Prince of Wales Island shoreline north of Hole-in-the-Wall and west of the western side of Buster Bay. The fishery was open Wednesdays at 12:00 PM to Sundays at 12:00 PM, from June 12–July 31. Only drift gillnet gear, not to exceed 50 fathoms in length, was allowed. Harvest was limited to 25 sockeye salmon in possession and annually. Fishers could retain other species incidentally harvested during this fishery. Pink and chum salmon subsistence harvests were allowed in all streams within the Point Baker–Port Protection area for stocks with positive C&T findings, except for the sockeye salmon streams identified on the permit. There was a 100-fish possession limit for pink salmon, with no annual limit. For chum salmon, 50 fish were allowed in possession with no annual limit. Coho salmon could be

18. Robert Larson, USFS. Stikine River subsistence salmon fishery: 2013 season summary. United States Department of Agriculture Forest Service, unpublished report, 2013.

19. Robert Larson, USFS. Stikine River subsistence salmon fishery: 2013 season summary. United States Department of Agriculture Forest Service, unpublished report, 2013.

20. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed May 11, 2013. http://labor.alaska.gov/research/pop/popest.htm

harvested under subsistence regulations for stocks with positive C&T findings in all streams in the Point Baker–Port Protection area with a possession limit of 20 fish and annual limit of 40 fish.

#### *Harvest Assessment Program*

Port Protection households maintain either a Ketchikan or Point Baker post office address and can also receive mail via private carrier from Ketchikan. Port Protection harvests can be included in either the Point Baker or Ketchikan harvest estimates. In 2013, 1 permit was issued in Port Protection and one was issued in Point Baker. Both were returned with no salmon harvest recorded (Table 13-4).

## KETCHIKAN MANAGEMENT AREA

The Ketchikan Management Area includes subsistence fisheries in the Hydaburg area, the Craig-Klawock area, and the Kasaan area, and personal use fisheries outside of these three areas as well as in the Ketchikan area. All of these areas are under the management responsibilities of the Division of Commercial Fisheries' Ketchikan Area office. There were an estimated 261 permits fished in the Ketchikan Management Area in 2013, slightly fewer than the 308 permits fished in 2012. The total estimated salmon harvest was 9,116 fish, less than the 2012 estimate of 11,510 salmon (Table 13-3). Sockeye salmon harvests contributed 73% of this harvest; in 2012 sockeye salmon contributed 85% to the overall salmon harvest.

### Craig, Klawock, and Hydaburg Subsistence Fisheries

#### *Background and History*

Hydaburg area waters with a positive C&T finding for salmon include Section 3A and the waters of District 2 in Nichols Bay north of lat. 54º 42.12′ N (5 AAC 01.716 (a)(18)). Craig–Klawock area waters with a positive C&T finding for salmon include Section 3B east of a line from Point Ildefonso to Tranquil Point; Warm Chuck Inlet north of a line from a point on Heceta Island at lat. 55º 44′ N, long. 133º 25′ W to Bay Point; Section 3C in Karheen Passage north of lat. 55º 48′ N and east of long. 133º 20′ W; and Sarkar Cove and the Sarkar lakes (5 AAC 01.716 (a)(15)).

Residents of the communities of Hydaburg, Craig, and Klawock on the west coast of Prince of Wales Island primarily use the salmon stocks of sections 3A and 3B, with the main harvest locations at Hetta Inlet–Sukkwan Strait (Eek Creek), Big Salt–Trocadero Bay (Klawock River), and Sea Otter Sound (Sarkar River).

In 2013, Craig had a population of 1,194, Klawock had a population of 785, and Hydaburg had a population of 405.[21] Estimates for Craig and Klawock are similar to 2012; the 2013 estimate for Hydaburg is an increase of approximately 40 residents.

#### *Regulations*

The 2013 subsistence sockeye salmon schedule in the Klawock River was from Monday at 8:00 AM to Friday at 5:00 PM from July 7–August 7, with a 20 sockeye salmon possession limit and no annual limit; in Hetta Inlet and Eek Creek, the season was June 1–August 31 with a possession limit of 20 sockeye salmon and no annual limit,; and in Hugh Smith Lake fishing was open June 22–July 31 with a 12 sockeye salmon possession limit and no annual limit. Karta River, Klakas Lake, and Sarkar were open from June 1 to July 31. The possession limit for all 3 systems was 20 fish; Karta River and Klakas Lake had no annual limit but Sarkar had a 40 fish limit. Other systems in the Ketchikan Management Area with positive C&T findings for salmon were open to sockeye salmon fishing June 1–July 31, with a 10 sockeye salmon possession limit and a 25 sockeye annual limit. Such streams had to be approved by ADF&G and listed on the permit. All streams in the Ketchikan Management Area with positive customary and traditional use findings were open for pink salmon July 1–September 30 with a 150 fish

21. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed July 2014. http://labor.alaska.gov/research/pop/popest.htm

possession limit and no annual limit. Chum and coho salmon fishing was open in the same waters July 1–October 31 with a possession limit of 25 chum and 20 coho salmon. There was no annual limit for chum salmon, but there was a 40 coho salmon limit annually. Additional conditions on the 2013 subsistence/personal use salmon permit for the Ketchikan Management Area stipulated that hand purse seines, beach seines, gillnets, spears, gaffs, cast nets, and dip nets were allowable subsistence/personal use gear. Gillnets were allowed in Yes Bay, Kendrick Bay, Nakat Inlet, and Neets Bay but could not exceed 50 fathoms in length. Herring gillnets could not exceed 10 fathoms in length, with no mesh size restrictions. A beach seine could not obstruct more than one-half the width of any fish stream and any channel or side channel of a fish stream, including the estuary leading to a fish stream. Sockeye salmon could not be retained as incidental catch.

#### *Harvest Assessment Program*

The estimated salmon harvest for the Craig–Klawock–Hydaburg area subsistence fisheries in 2013 was 4,179 salmon, including 3,105 sockeye salmon (74%), 798 coho salmon (19%), 265 pink salmon (6%), and 12 chum salmon (<1%) (Table 13-3). The 2013 harvest decreased from 6,023 fish in 2012. Sockeye salmon harvests decreased the most, down from 5,670 sockeye in 2012. Chum salmon harvests also decreased, while harvests of pink and coho salmon increased. An estimated 82 permits were fished in the area in 2013.

As reported in Table 13-4, 127 permits were issued to residents of Craig and 109 (86%) were returned. The total estimated salmon harvest of Craig residents was 810, a decrease of 500 fish from 2012 estimates. By species, the harvest consisted of 628 sockeye salmon (78%), 122 coho salmon (15%), 59 pink salmon (7%), and 1 chum salmon (<1%). The total estimated salmon harvest for Klawock, based on 106 permits issued and 79 returned (75%), was 1,830, a decrease of about 1,000 fish from 2012, consisting of 1,234 sockeye salmon (67%), 439 coho salmon (24%), 145 pink salmon (8%), and 12 chum salmon (1%). The proportion of sockeye salmon in the overall harvest decreased from 90% in 2012, while the proportion of coho salmon increased from 7%. The total estimated salmon harvest for Hydaburg, based on 69 permits issued and 44 returned (64%), was 1,531 salmon, the majority of which were sockeye salmon (1,356). An estimated 138 coho salmon and 36 pink salmon were also harvested. Not all permits were fished solely in their respective areas. Of the three communities, Hydaburg harvests showed the smallest decrease in salmon harvests. In 2012, the estimated harvest of salmon by Hydaburg residents was 1,797, mainly sockeye salmon. Fewer permits were issued in Craig and Klawock, more were issued in Hydaburg.

### Kasaan Area Subsistence Fisheries

#### *Background and History*

There is a positive C&T finding for salmon in waters on the east coast of Prince of Wales Island for the Kasaan area waters of District 2 north of the latitude of the northernmost tip of Chasina Point then west of a line from the northernmost tip of Chasina Point to the easternmost tip of Grindall Island to the easternmost tip of the Kasaan Peninsula (5 AAC 01.716 (a)(12)). Salmon fishing in all other marine waters along the east coast of Prince of Wales Island occurs under personal use and sport regulations. The principal waters used for personal use salmon fishing along the eastern coast of Prince of Wales Island are Kegan Lake, the Thorne River, and Hatchery Creek–Sweetheart Creek. The personal use fisheries are described in the Ketchikan Area Personal Use Fisheries section.

In 2012, Coffman Cove had a population of 162, Edna Bay's population was 49, Hollis had a population of 119, Kasaan's population was 75, Thorne Bay's population was 518, and the population of Whale Pass was 39.[22]

22. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed May 11, 2015. http://labor.alaska.gov/research/pop/popest.htm

### *Regulations*

All streams in the Ketchikan Management Area with positive C&T findings not otherwise listed on the permit were open for subsistence sockeye salmon fishing June 1–July 31, with a 10 fish possession limit and a 25 fish annual limit. All streams with a positive C&T determination were open to pink salmon fishing July 1–September 30, with a limit of 150 fish in possession and no annual limit. Coho and chum salmon fishing was also open in these waters July 1–October 31, with a limit on coho salmon harvests of 20 fish in possession and 40 fish annually. The limit on chum salmon harvests was 25 fish in possession and no annual limit.

Allowable gear in the subsistence fishery included hand purse seines, beach seines, spears, gaffs, cast nets, and dip nets. Salmon could not be taken with a line attached to a rod or pole. Sockeye salmon could not be retained as incidental catch.

### *Harvest Assessment Program*

As reported in Table 13-3, in 2013 an estimated 70 permit holders fished in the Kasaan area subsistence fisheries with an estimated salmon harvest of 1,870 salmon. The harvest included 1,366 sockeye salmon (73%), 277 pink salmon (15%), 225 coho salmon (12%), and 1 chum salmon (<1%). The total harvest decreased from a 2012 estimate of 2,366. Only the harvest of coho salmon increased over 2012 levels. Fewer permits were fished in 2013 compared to 2012.

Based on 12 permits issued to residents of Kasaan and 10 returned (83%) in 2013, an estimated 226 salmon were harvested, the majority consisting of sockeye salmon (182) as well as 35 coho and 8 pink salmon (Table 13-4). Thorne Bay residents were issued 24 permits, 23 of which were returned (96%), resulting in a harvest estimate of 154 salmon, including 83 sockeye salmon, 69 coho salmon, and 2 pink salmon (Table 13-4). Four permits were issued to Naukati Bay residents and 3 were returned. No salmon harvest was reported. In Hollis, 32 permits were issued and 27 were returned (84%). An estimated 383 salmon were harvested, including 325 sockeye salmon, 31 pink salmon, and 27 coho salmon. In Coffman Cove 7 permits were issued and 5 were returned (71%). An estimated 146 salmon were harvested, including 60 sockeye salmon, 46 coho salmon, and 39 pink salmon. No permits were issued in Whale Pass. Not all permits were fished solely in their respective areas. While harvests in Hollis decreased significantly from 2012, harvests of other communities remained the same or slightly increased from 2012. Harvests of coho salmon increased in all communities except Hollis.

## Ketchikan Area Personal Use Fisheries

### *Background and History*

The Division of Commercial Fisheries' Ketchikan Area office is responsible for oversight of the subsistence and personal use salmon fisheries in districts 1, 2, 3, and 6. Some waters within sections 1A, 1C, 1D, 1E, 1F, and District 2 fall within the Ketchikan Nonsubsistence Area (Figure 13-1). The BOF made a positive C&T finding for salmon stocks in the waters traditionally used by the Tongass Tlingit of Saxman. These waters include the Naha River, Boca de Quadra in the waters of Sockeye Creek and Hugh Smith Lake, as well as the salt waters within 500 yards of the terminus of Sockeye Creek (5 AAC 01.716 (a)(19)).

The communities of Ketchikan and Saxman are the principal users of the fisheries in the Ketchikan area. In 2013, the population of the Ketchikan borough, excluding Saxman, was 13,417. Saxman, located within the Ketchikan Gateway Borough, had a population of 411.[23]

23. Alaska Department of Labor and Workforce Development (ADLWD), Juneau. n.d. "Research and Analysis Homepage." Accessed July 2014. http://labor.alaska.gov/research/pop/popest.htm

### *Regulations*

The 2013 subsistence/personal use salmon permit for the Ketchikan Management Area provided for a July 1–August 30 open season for sockeye salmon at McDonald Lake (Yes Bay), with a possession and annual limit of 30 fish. Kegan Lake and Thorne River were open from June 1–July 31, with a possession limit of 12 sockeye salmon and an annual limit of 50 sockeye salmon. Hatchery Creek was open June 1–June 30, Thursdays through Sundays, with a limit of 3 sockeye salmon in possession and 9 annually. The Hatchery Creek personal use fishery closed inseason on June 23 for the remainder of the season due to low sockeye salmon returns. Other streams in the Ketchikan Management Area that were open to personal use fishing, except the Ketchikan road system, were open June 1–July 31 with a limit of 10 sockeye salmon in possession and a 25 fish annual limit. Leask Creek and Mahoney creek and lake, and marine waters within 500 yards of the terminus of these streams, remained closed. For pink and chum salmon, all stocks in streams with no positive C&T finding within the Ketchikan Management Area, except the Ketchikan road system, were open to personal use fishing. The season for pink salmon ran from June 1–September 30 with a limit of 150 fish in possession and no annual limit. For chum salmon, the open season was from June 1–October 31 with a possession limit of 25 and no annual limit. The season for Chinook salmon ran from July 1 to August 30 in the Herring Bay Terminal Harvest Area only; the possession limit was 50 fish with no annual limit. Sockeye salmon could not be retained as incidental catch. The legal gear types specified under the terms of this permit included hand purse seines, beach seines, gillnets, spears, gaffs, cast nets, and dip nets. Gillnets were allowed only in Yes Bay, Kendrick Bay, Nakat Inlet, and Neets Bay; they could not exceed 50 fathoms in length. Herring gillnets could not exceed 10 fathoms in length, with no mesh size restrictions., A beach seine could not obstruct more than one-half the width of any fish stream and any channel or side channel of a fish stream, including the estuary leading to a fish stream.

### *Harvest Assessment Program*

The total estimated salmon harvest in the Ketchikan area personal use fisheries in 2013 was 3,067 fish, including 2,163 sockeye salmon (71%), 477 pink salmon (16%), 381 chum salmon (12%), 35 coho salmon (1%), and 10 Chinook salmon (<1%) (Table 13-3). An estimated 108 personal use permits were fished. The 2013 harvest is similar to the 2012 harvest. Harvest of sockeye salmon decreased, while harvests of all other species increased.

As reported in Table 13-4, the total estimated salmon harvest for the community of Ketchikan (including Ward Cove), based on 253 permits issued and 221 returned (87%), was 3,288, including 2,255 sockeye salmon (69%), 307 chum salmon (9%), 556 pink salmon (17%), 160 coho salmon (5%), and 10 Chinook salmon (<1%). In Saxman, based on 20 permits issued and 18 returned (90%), a total of 361 salmon were harvested. Not all permits were fished solely in their respective areas. Of the total, sockeye salmon constituted the largest proportion at 324 fish (90%) followed by coho salmon with 22 fish (6%), chum salmon at 12 fish (3%), and then pink salmon at 2 fish (1%). Based on 2 permits issued and 1 returned (50%), in 2013 residents of Metlakatla harvested no salmon under state permit regulations. Fewer permits were issued in each community and harvests decreased slightly in all three communities as well. Harvest of coho salmon increased in Ketchikan and Saxman.

Table 13-1.–Subsistence and personal use salmon harvests by district, Southeast region, 2013.

| Fishing location | Name | Permits fished | | Estimated salmon harvest | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | Reported | Estimated | Chinook | Sockeye | Coho | Chum | Pink | Total |

a. For years prior to 1996, only permits returned with harvest data were included, and harvests reported in these years were not expanded into estimates. Caution should be used if comparing pre-1996 data with later data.

ND = no data.

# ACKNOWLEDGEMENTS

Each year, thousands of Alaska residents who participate in subsistence and personal use fisheries take the time to provide harvest information to ADF&G. We acknowledge their support with profound gratitude, for without it, a report like this would be impossible to produce.

We also offer thanks to the numerous ADF&G staff in the divisions of Commercial Fisheries, Sport Fish, and Subsistence who conduct the programs that collect, analyze, and report the subsistence and personal use fisheries harvest data every year. They, too, made this report possible.

Many ADF&G personnel generously made time to allow Division of Subsistence staff to interview them about subsistence databases and harvest assessment programs. We have relied upon their numerous insights about these programs to develop the Alaska Subsistence Fisheries Database, as well as to evaluate the data that appear in this report. We sincerely appreciate their help.

This annual report for 2013 is the result of the work of a number of Division of Subsistence staff. Former division employees Dave Caylor, Jeannie Heltzel, and Brian Davis helped design and update the Alaska Subsistence Fisheries Database. Data for 2013 were compiled by Terri Lemons, with assistance from Dave Koster. Division personnel who authored report chapters were James A. Fall, Caroline L. Brown, Sarah S. Evans, Rosalie A. Grant, Hiroko Ikuta, Lisa Hutchinson-Scarbrough, Bronwyn Jones, Meredith Ann Marchioni, Elizabeth Mikow, Joshua T. Ream, and Lauren A. Sill. We also acknowledge the contributions of Eunice Dyasuk, who administers the division's subsistence salmon permit program for Bristol Bay in Dillingham, as well as Lisa Olson, Garrett Zimpelman, and Adam Knight, who reviewed and edited the report.

As noted in the report itself, this is the 15th in a series of statewide summaries of subsistence and personal use fisheries harvest data. We encourage those who use this report to offer ideas and suggestions to improve future volumes in this series.
