April 2025

The Fishery Management Report series was established in 1989 by the Division of Sport Fish for the publication of an overview of management activities and goals in a specific geographic area, and became a joint divisional series in 2004 with the Division of Commercial Fisheries. Fishery Management Reports are intended for fishery and other technical professionals, as well as lay persons. Fishery Management Reports are available through the Alaska State Library and on the Internet: <http://www.adfg.alaska.gov/sf/publications/>. This publication has undergone regional peer review.

Product names used in this publication are included for completeness and do not constitute product endorsement. The Alaska Department of Fish and Game does not endorse or recommend any specific company or their products.

ABSTRACT

Southeast Alaska and Yakutat commercial, personal use, and subsistence salmon fisheries are summarized for the 2022 season. Historical harvests are provided for comparison. Total commercial harvest in 2022 was 31.7 million salmon with an estimated exvessel value of \$163 million. Harvest by species in 2022 included 266,000 Chinook *Oncorhynchus tshawytscha*, 1.2 million sockeye *O. nerka*, 1.5 million coho *O. kisutch*, 18.3 million pink *O. gorbuscha*, and 10.4 million chum *O. keta* salmon. In the purse seine fishery, 194 permit holders harvested 19.0 million salmon, including 14.7 million pink and 3.5 million chum salmon. In the drift gillnet fishery, 373 permit holders harvested 3.7 million salmon, including 2.4 million chum, 633,000 pink, 480,000 sockeye, 133,000 coho, and 16,000 Chinook salmon. In the troll fishery, 608 power troll and 173 hand troll permit holders (781 total permits) harvested 197,000 Chinook, 854,000 coho, and 1.1 million chum salmon. In the set gillnet fishery, 77 permit holders harvested 48,000 sockeye and 63,000 coho salmon. Hatchery organizations harvested a total of 4.6 million salmon for cost recovery, including 3.4 million chum salmon. In the 2022 subsistence and personal use fisheries, 3,028 household permits were issued for fishing in Southeast Alaska and Yakutat; reported 2022 harvest to date is 23,800 salmon.

Keywords: Southeast Alaska, Yakutat, 2022 season, commercial fisheries, personal use fisheries, subsistence fisheries, Chinook *Oncorhynchus tshawytscha*, sockeye *Oncorhynchus nerka*, coho *Oncorhynchus kisutch*, pink *Oncorhynchus gorbuscha*, chum *Oncorhynchus keta*, salmon, exvessel value, permit holders, hatchery, purse seine, drift gillnet, power troll, hand troll, set gillnet

INTRODUCTION

This report is an overview of the commercial and subsistence/personal use salmon fisheries in the Southeast Alaska and Yakutat Region (Region 1) for the 2022 season. Separate annual management reports will be issued providing more detailed summaries of the 2022 Region 1 salmon troll fishery, set gillnet fishery, and the purse seine and drift gillnet fisheries.

SOUTHEAST ALASKA/YAKUTAT REGION

Fisheries management in the State of Alaska is divided among 4 large geographical regions: Southeast/Yakutat (Region 1), Central, Westward, and Arctic-Yukon-Kuskokwim. Region 1 consists of Alaska waters between Cape Suckling on the north and Dixon Entrance on the south (Figure 1). Region 1 is divided into 2 salmon net registration areas. Registration Area A, the Southeast Alaska area, extends from Dixon Entrance to Cape Fairweather. The Southeast Alaska area is divided into 17 regulatory districts, Districts 1 through 16 and the Dixon Entrance District (Figure 2). Some Registration Area A districts are further divided into sections by regulation. Registration Area D, the Yakutat area, extends from Cape Fairweather to Cape Suckling. The Yakutat area is further divided into the Yakutat District, extending from Cape Fairweather to Icy Cape, and the Yakataga District, extending westward from Icy Cape to Cape Suckling (Figure 3).

For management and administrative purposes, Region 1 is divided into 6 management areas with offices located in Juneau, Ketchikan/Craig, Petersburg, Sitka, Haines, and Yakutat. Offices in Craig and Yakutat are seasonally staffed and other offices are open all year.

FISHERIES MANAGEMENT ORGANIZATION

Management of Region 1 salmon fisheries is provided by area management biologists, regional management biologists, and their staff. There are 6 area management biologists, corresponding with each area office. Management biologists with area responsibilities oversee the commercial salmon net (purse seine, drift gillnet, and set gillnet), herring, shrimp (pot gear), miscellaneous shellfish (dive fisheries), and the subsistence/personal use fisheries in their respective areas. Management biologists with regional responsibilities oversee the salmon troll, groundfish, crab, and shrimp beam trawl fisheries. There is a closely coordinated regional management approach

for every fishery because of the size of the region and the spatial and temporal movement of fish and fishers between the various management areas. Prior to each salmon season, the Alaska Department of Fish and Game (ADF&G) publishes detailed management plans that specify how that season's fisheries will be managed and contain information about expected returns. Inseason management actions specify times and areas of fishery openings and explain additional measures. These actions are implemented through emergency orders under authority delegated by the department commissioner to regional and area management biologists. Details of openings are announced in widely distributed department-issued advisory announcements. All landings of commercially harvested salmon are reported to the department on fish tickets by the initial buyers. Subsistence and personal use fisheries are managed under permit authority; a regional permit is issued online or in area offices. Permit conditions vary by management area. Harvests are reported online during or after the season or when permits are returned at the end of the season.

FISHERY CHARACTERISTICS

Salmon are commercially harvested in Southeast Alaska (Registration Area A) with purse seines and drift gillnets, in Yakutat (Registration Area D) with set gillnets, and in both areas with hand troll and power troll gear. The salmon net fisheries are confined to state waters. The troll fishery operates in both state waters and in the federal waters of the Exclusive Economic Zone. The use of floating fish traps is only allowed within the Annette Islands Reserve (AIR), established by Presidential Proclamation in 1916; however, there have been no reported fish trap harvests since 1993.

Region 1 salmon fisheries are complex due to the mixed stock and mixed species nature of the runs and different gear groups targeting the same stocks of fish. Because the region contains approximately 5,500 salmon-producing streams and tributaries of various productivity levels, it is impractical to apply stock-specific fisheries management for most stocks. Additionally, some salmon harvested in the region originate from other states (primarily Washington and Oregon) and Canada. Salmon fisheries are managed for sustained yield and allocated among users according to Alaska Board of Fisheries regulations and harvest-sharing provisions of the Pacific Salmon Treaty (PST) between the United States and Canada.

2022 HISTORICAL COMPARISON

Commercial utilization of Region 1 salmon resources began in the late 1870s (Figure 4). Until the early 1900s, sockeye salmon *Oncorhynchus nerka* was the primary species harvested (Figure 5). Pink salmon *O. gorbuscha* began to dominate the harvest in the early 1900s. During the past 10 years, pink salmon has composed 65% of the region's total salmon harvest (Table 1). The relative order of harvest (in numbers of fish) from highest to lowest is generally pink, chum *O. keta*, coho *O. kisutch*, sockeye, and Chinook *O. tshawytscha* salmon.

Region 1 salmon harvest peaked at over 60 million fish in the late 1930s and early 1940s, then declined to historically low levels in the 1950s and early 1960s (Figure 4). During the middle to late 1960s, harvests increased, but in the early 1970s another decline in production occurred. From the early 1980s through the mid-2000s, salmon harvests increased substantially. Record harvests since statehood occurred during the 12-year period from 1993 through 2004 for Chinook (2004), sockeye (1993), coho (1994), and chum salmon (1996; Table 1). All-time record harvests dating back to 1878 were set for sockeye and Chinook salmon prior to statehood, with 3.5 million sockeye salmon harvested in 1914 and 878,000 Chinook salmon harvested in 1937 (Byerly et al. 1999).

The record harvest for coho salmon was 5.7 million fish in 1994, 16.0 million fish for chum salmon in 1996, and 94.8 million fish for pink salmon in 2013. The record regional total commercial harvest was set in 2013 at 112 million salmon. Within the most recent decade, harvests have fluctuated greatly. Because pink salmon are the most abundant species, downward harvest trends are in large part due to low even-year pink salmon runs that began in 2006. With the exception of 2019, odd-year harvests over the same period have been above the long-term average (1962–2021).

Salmon harvests since 1962, and average harvests by gear and harvest type, are presented in Table 2. The various salmon fisheries in the region are well established, and the distribution of harvests between fisheries has changed little when comparing the recent 10-year average (2012–2021) or the long-term average since 1962. The exception is that private hatchery cost-recovery harvests, which began around 1980, can account for a substantial proportion of overall harvests. Recent 10-year average harvests in percentages by gear type are as follows: 70% by purse seine, 11% by drift gillnet, 9% by hatchery organizations, 5% by troll, 4% within the AIR, and 1% by set gillnet. In 2022, the total harvest of 31.7 million salmon ranked 33rd in 61 years since 1962.

Chinook salmon harvest of 264,000 fish in 2022 was above the recent average and below the long-term average (Table 3, Figure 5). The 2022 Chinook salmon harvest ranks 38th lowest over the 61-year period since 1962. Targeted Chinook salmon fisheries are composed of 3 elements: (1) coastwide mixed stocks harvested within limits of the all-gear PST harvest ceiling; (2) production from Alaska Chinook salmon enhancement programs; and (3) directed fisheries on surplus returns to the Stikine River, Taku River, or both. The average total Chinook salmon harvest since 1962 is approximately 293,000 fish. Chinook salmon less than 28 inches may be retained but not sold in the purse seine fishery, and Chinook salmon of all sizes may be sold in the drift gillnet fishery. The PST accounts for large Chinook salmon—defined as greater than or equal to 28 inches overall length—as Treaty Chinook salmon. Preliminary harvests of coastwide Chinook salmon accountable under the PST included 187,600 fish by troll gear, 14,800 fish by purse seine gear, 1,900 fish by gillnet gear, and 34,200 fish for sport fisheries. Total commercial harvests of Alaska hatchery origin Chinook salmon were 61,200 fish, which was 23% of total Chinook salmon harvests. This harvest included 12,900 fish determined by CWT to have been harvested in common property fisheries outside of hatchery terminal harvest areas, harvests from terminal harvest areas, and private hatchery cost-recovery harvests. For transboundary river stocks regulated under the PST, forecasts for the Stikine and Taku Rivers in 2022 provided no allowable catch (AC) for directed fisheries on returns of large Chinook salmon (28 inches in length or greater).

The 2022 sockeye salmon harvest was 1.2 million fish (Table 4, Figure 5). This harvest was above the recent 10-year average and below the long-term average of 1.3 million fish. The 2022 sockeye salmon harvest ranks 29th over the 61-year period since 1962. Sockeye salmon harvests in the northern boundary area and transboundary river fisheries are regulated under the PST to provide for conservation and harvest sharing with Canada. The Southeast Alaska purse seine fishery harvest of 629,000 sockeye salmon was above the recent 10-year and long-term averages, and accounted for 52% of the region’s total sockeye salmon harvest. The drift gillnet fishery harvest of 480,000 sockeye salmon was above the recent average but below the long-term average, and accounted for 40% of the region’s total sockeye salmon harvest. The set gillnet fishery harvest of 48,000 sockeye salmon was below both the recent and long-term averages and accounted for 4% of the regional total sockeye salmon harvest (Table 2).

Coho salmon harvest was 1.5 million fish in 2022 (Table 5, Figure 5). This harvest was less than both the recent and long-term averages and ranks 44th in the 61 years since 1962. Coho salmon

harvest in the troll fishery was 854,000 fish, less than both the long-term and recent averages, and accounted for 57% of the harvest. Only the hatchery harvest of coho salmon was above both the recent and long-term averages.

Pink salmon harvest was 18.3 million fish in 2022, 58% of the total Region 1 salmon harvest (Table 1, Figure 5). Pink salmon harvest was below both the recent and long-term averages, ranking as the 41st largest harvest since 1962. Purse seine pink salmon harvest was 14.7 million fish, 80% of the total pink salmon harvest. Pink salmon harvest in all fisheries were below recent and long-term averages (Table 6).

Chum salmon harvest of 10.5 million fish in 2022 ranks 16th since 1962 and was above the recent and long-term averages (Table 7, Figure 5). The purse seine chum salmon harvest was 3.5 million fish, 33% of the total chum salmon harvest. The drift gillnet chum salmon harvest was 2.4 million fish, 23% of the total chum harvest. The hatchery cost-recovery chum harvest was 3.4 million fish, 33% of the total harvest. Although the troll chum salmon harvest was only 10% of the region's total harvest at 1.1 million fish, it is the 2nd highest chum salmon harvest on record for the troll fishery. Most chum salmon production in Region 1 is attributable to hatchery production. Before hatchery chum salmon production became significant in 1984, the 1962–1983 regional average chum salmon harvest was 1.6 million fish.

FISHERY PARTICIPATION

According to information from the Commercial Fisheries Entry Commission (CFEC 2022), 2,755 limited entry permits were active (issued or eligible to be renewed) in 2022. Active permits included 278 purse seine, 472 drift gillnet, 167 set gillnet, 882 hand troll, and 956 power troll (Table 8). A total of 1,425 permit holders reported salmon landings in 2022, including 194 purse seine, 373 drift gillnet, 77 set gillnet, 173 hand troll, and 608 power troll.

Purse seine participation by 194 permit holders in 2022 was a decrease of 14 permits from 2021, a decrease from the recent average participation of 245 permits, and was the second lowest since limited entry went into effect in 1976. The number of purse seine permits issued was reduced in 2008 by 35 permits through a permit buyback fleet-reduction program. In 2012, an additional buyback program administered by the CFEC, and the National Marine Fisheries Service further reduced the number of permits by 64 permits (Table 8). Drift gillnet participation by 373 permit holders was an increase from the 2021 level but still below the recent 10-year average of 417 permits. Set gillnet effort in 2022 by 77 permit holders was below both the recent and long-term averages and the lowest since 1976. Power troll participation by 608 permit holders was below both the recent and long-term average, and hand troll effort by 173 permit holders was also below both recent and long-term averages. Participation in the troll fishery by both hand and power troll was the lowest participation since limited entry went in effect in 1976. Overall participation in all 2022 fisheries was 19% below the recent 10-year average.

2022 SALMON HARVEST

Region 1 cumulative commercial salmon harvest by all harvest categories, including hatchery cost recovery, was 31.7 million fish in 2022 (Table 9). Total common property commercial harvest was 25 million fish, 79% of the total harvest. Overall, harvest in numbers of salmon in 2022 was about half that of the 2021 harvest. The 2022 harvests by species compared with 2021 were as follows: Chinook–119%, sockeye–107%, coho–95%, pink–38%, and chum salmon–141% (Table 1). Total commercial salmon harvest proportions by species were as follows: 1% Chinook, 4% sockeye,

5% coho, 58% pink, and 33% chum salmon. The 2022 combined-gear, large Chinook salmon harvest of 264,000 fish was 102% of the most recent average and 90% of the long-term average. Sockeye salmon harvest of 1.2 million fish was 92% of the recent average and 113% of the long-term average. Coho salmon harvest of 1.5 million fish was 70% of the recent and 65% of the long-term averages. Pink salmon harvest of 18.3 million fish was 60% of the recent and 56% of the long-term averages. Chum salmon harvest of 10.4 million fish was 74% of the recent and 120% of the long-term averages. The all-species total harvest was 169% of the recent average and 109% of the long-term average harvest (Table 1).

HARVEST BY GEAR TYPE

Region 1 2022 salmon harvests by gear type or harvest category and species are summarized in Table 9. Historical harvests showing percentages of harvest by gear are summarized in Table 2. Salmon landed by purse seine gear accounted for 60% of the total salmon harvest, followed by hatchery cost recovery (14%), drift gillnet (12%), AIR fisheries (7%), and troll (7%). Combined hand and power troll harvests accounted for 74% of regional Chinook salmon harvest and 57% of coho salmon harvest (Tables 3 and 5). Of the total harvest, purse seine accounted for 52% of sockeye, 80% of pink, and 33% of chum salmon harvest in the region (Tables 4, 6, and 7). Drift gillnet accounted for 10% of Chinook, 40% of sockeye, 9% of coho, and 23% of chum salmon harvest (Tables 3, 4, 5, and 7). Set gillnet harvested 4% of sockeye and 9% of coho salmon (Tables 4 and 5). Approximately 9% of Chinook, 2% of sockeye, 18% of coho, and 33% of chum salmon harvests were taken in hatchery cost-recovery fisheries (Tables 3, 4, 5, and 7).

Total Chinook salmon harvests of 266,000 fish included 197,000 by troll, 27,000 by purse seine, 16,000 by drift gillnet, 23,000 in hatchery cost recovery, 1,700 within the AIR, and 400 by Yakutat set gillnet fisheries (Table 3). Sockeye salmon harvests of 1.2 million fish included 629,000 by purse seine, 480,000 by drift gillnet, 25,000 by hatchery cost recovery, and 48,000 by set gillnet fisheries (Table 4). Coho salmon harvests of 1.5 million fish included 854,000 by troll, 133,000 by drift gillnet, 162,000 by purse seine, 271,000 in hatchery cost recovery, and 63,000 by set gillnet fisheries (Table 5). Pink salmon harvests of 18.3 million fish included 14.8 million by purse seine, 633,000 by drift gillnet, 820,000 by hatchery cost recovery, and 2.0 million by AIR fisheries (Table 6). Chum salmon harvests of 10.4 million fish included 3.5 million by purse seine, 2.4 million by drift gillnet, 3.4 million in hatchery cost recovery, 1.1 million by troll, and 119,000 fish by AIR fisheries (Table 7).

EXVESSEL VALUE

The initial reported value of the 2022 Region 1 commercial salmon harvest based on fish ticket data for all fisheries was \$163 million (Table 10). The total 2022 salmon harvest in numbers of fish was 54% of the 2021 harvest. The 2022 commercial harvest of 161 million pounds was 81% of the 2021 commercial harvest of 202 million pounds. In 2022, pink salmon accounted for 42% of the total weight of salmon harvested, compared with 67% in 2021. In 2022, chum salmon accounted for 46% of the total weight of salmon harvested, compared with 24% in 2021. Average weights by species were similar (within 2%) in 2022 compared with 2021 for Chinook, sockeye and coho salmon, and increased for pink (25%) and chum salmon (7%). Prices from 2022 fish tickets compared to 2021 prices decreased for Chinook (-11%), coho (-15%), and pink salmon (-3%), and increased for sockeye (6%) and chum (20%) salmon (Table 10).

The preliminary reported exvessel value of the 2022 Region 1 commercial salmon harvest for common property purse seine, gillnet, and troll fisheries combined based on fish ticket data is \$120 million. The 2022 season exvessel value for these salmon fisheries is 95% of the recent 10-year average of \$125 million and ranks 10th over the 47-year period from 1976 (Table 11, Figure 6). Common property fishery exvessel value estimates for 2022 exclude AIR, hatchery cost recovery, and miscellaneous harvests.

The 2022 exvessel value by gear was highest for the purse seine fishery (\$56.3 million), followed by the hatchery cost recovery (\$39.2 million), troll (\$33.3 million), drift gillnet (\$29.0 million), AIR (\$4.0 million), and set gillnet (\$1.0 million) fisheries (Table 10). Comparing the preliminary value for 2022 to reported CFEC fishery values by fishery for the 47 years since 1976, 2022 would rank as the 10th highest value for purse seine, 7th highest for drift gillnet, 8th highest for troll, and 45th highest for the set gillnet fishery (Table 11, Figure 6). The regional value breakdown by species included \$17.1 million for Chinook, \$13.1 million for sockeye, \$15.7 million for coho, \$23.7 million for pink, and \$94.0 million for chum salmon (Table 10).

SUBSISTENCE AND PERSONAL USE SALMON FISHERIES

In 2018, ADF&G began online permitting for personal use and subsistence fisheries in Southeast Alaska. There is now one permit for all of Southeast Alaska and Yakutat with specific regulations and guidelines for individual management areas provided to the user depending on where they intend to fish. Because unique permits are not required for each management area, there is no area office associated with permit data. As a result, permits and harvest will be analyzed by city of residence instead of management area (as was done in past versions of this report).

Reporting of 2022 harvest information for subsistence and personal use fisheries for Region 1 remains incomplete. A total of 3,028 subsistence and personal use salmon permits were issued in 2022. One permit may be issued per household. As of December 20, 2022, 1,619 permits have been returned and 1,002 permits fished, harvesting 23,785 salmon of which sockeye salmon accounted for 89% of the reported harvest (Table 12, Figure 7). Combined subsistence and personal use fishery permits issued to households by community include the following: 164 from Ketchikan, 304 from Prince of Wales Island Communities, 111 from Wrangell, 155 from Petersburg, 59 from Kake, 34 from Angoon, 697 from Sitka, 59 from Hoonah, 780 from Juneau, 409 from Haines, 75 from Yakutat, and 181 from other Alaska communities. Salmon harvests by management area included 1,578 fish for Ketchikan, 1,504 fish for Petersburg, 7,203 fish for Sitka, 6,571 fish for Juneau, 5,429, fish for Haines, and 1,500 fish for Yakutat.

Note: En dashes indicate no data.

^a Annual Chinook salmon harvest is reported by troll season, October 1, 2021–September 30, 2022, since 1979 when the regulatory season was implemented.

^b Jack Chinook salmon are ≤ 28 inches. Prior to the 2018 season in the traditional purse seine fishery, Chinook salmon of < 21 inches could be retained and sold, and Chinook salmon > 21 and < 28 inches could be retained as personal use. From 2018, Chinook salmon ≤ 28 inches harvested in traditional fisheries could only be retained as personal use. Chinook of all sizes may be sold in the drift gillnet fishery. Jack fish ticket data were revised in 2012, for the years 2005–2012, to provide more accurate accounting of gillnet-harvested Chinook salmon for Pacific Salmon Treaty accounting purposes. Chinook salmon in the drift gillnet fishery are recorded as 1 size category on fish tickets, and separate accounting of jacks is based on port sampling data.

^c Minimum harvest by species.

^d Maximum harvest by species.

Note: En dashes indicate no data.

^a Salmon harvest is reported by calendar year except for the troll fishery. Troll is reported by season (October 1–September 30) beginning October 1, 1979, for the 1980 season.

^b Includes salmon caught and sold in private, state, and federal hatchery fisheries and carcass sales.

^c Includes confiscations, commercial test fisheries, and sport fish salmon derbies where fish were sold.

^d Minimum harvest by harvest type.

^e Maximum harvest by harvest type.

Table 3.—Southeast Alaska annual commercial Chinook salmon harvest by harvest type, in numbers and percent, 1962–2022.

Note: Chinook salmon harvest is reported by season (October 1–September 30) beginning October 1, 1979, for the 1980 season.

Note: En dashes indicate no data.

^a Includes confiscations, test fisheries, and sanctioned sport fish salmon derbies where fish were sold.

^b Minimum harvest by harvest type.

^c Maximum harvest by harvest type.

Note: En dashes indicate no data.

^a Harvest accounting period for the Chinook salmon season in the troll fishery is from October 1, 2021, through September 30, 2022.

^b Jack Chinook salmon are ≤28 inches. Prior to the 2018 season in the traditional purse seine fishery, Chinook salmon of <21 inches could be retained and sold, and Chinook salmon >21 and <28 inches could be retained as personal use. From 2018, Chinook salmon ≤28 inches harvested in traditional fisheries could only be retained as personal use. Chinook of all sizes may be sold in the drift gillnet fishery. Jack fish ticket data were revised in 2012, for the years 2005–2012, to provide more accurate accounting of gillnet harvested Chinook salmon for Pacific Salmon Treaty (PST) accounting purposes. The PST accounts for large Chinook salmon, ≥28 inches overall length, as Treaty Chinook.

^c Southern Southeast Alaska includes Districts 101 to 108.

^d Northern Southeast Alaska includes Districts 109 to 114.

^e Includes salmon that were confiscated or caught in sport fish salmon derbies or commercial test fisheries, and sold.

Table 10.—Southeast Alaska estimated exvessel value, harvest, average weight, and price paid per pound by gear and species, 2022.

Note: En dashes indicate no data.

^a Exvessel value calculation = (number caught) x (average weight) x (average exvessel price).

^b In addition to adults, jack Chinook salmon <28 inches may only be sold in the drift gillnet fishery and jack salmon <28 inches may be sold in the purse seine fishery if harvested in a hatchery terminal harvest area.

^c Annette Island Reserve includes purse seine, drift gillnet, and hand and power troll gear types.

^d Includes confiscations, commercial test fisheries, and sport derbies where fish were sold.

^e Average weight = (total pounds for all fish tickets (where pounds>0))/(total number of fish for all tickets (where number>0)).

^f Average price = (total value for all fish tickets (where value>0))/(total pounds for all fish tickets (where pounds>0)).

Table 11.—Southeast Alaska annual salmon exvessel value estimates from Commercial Fisheries Entry Commission (1976–2019) and fish ticket data (2022) by gear group, 1976–2022.

Note: Data presented in this table are for Southeast Alaska only and excludes the Yakutat area.

^a Prior to 1996, the numbers of permits issued and returned are not as reliable due to data entry omissions (if a permit had zero harvest it was not recorded as a returned permit).

^b Prior to 1985, the numbers of permits issued and returned were not recorded.

^c Number of permits fished is estimated from permit data.

^d Data for 2022 are preliminary because not all permits have been returned. Permits will continue to be returned and entered through the next season.

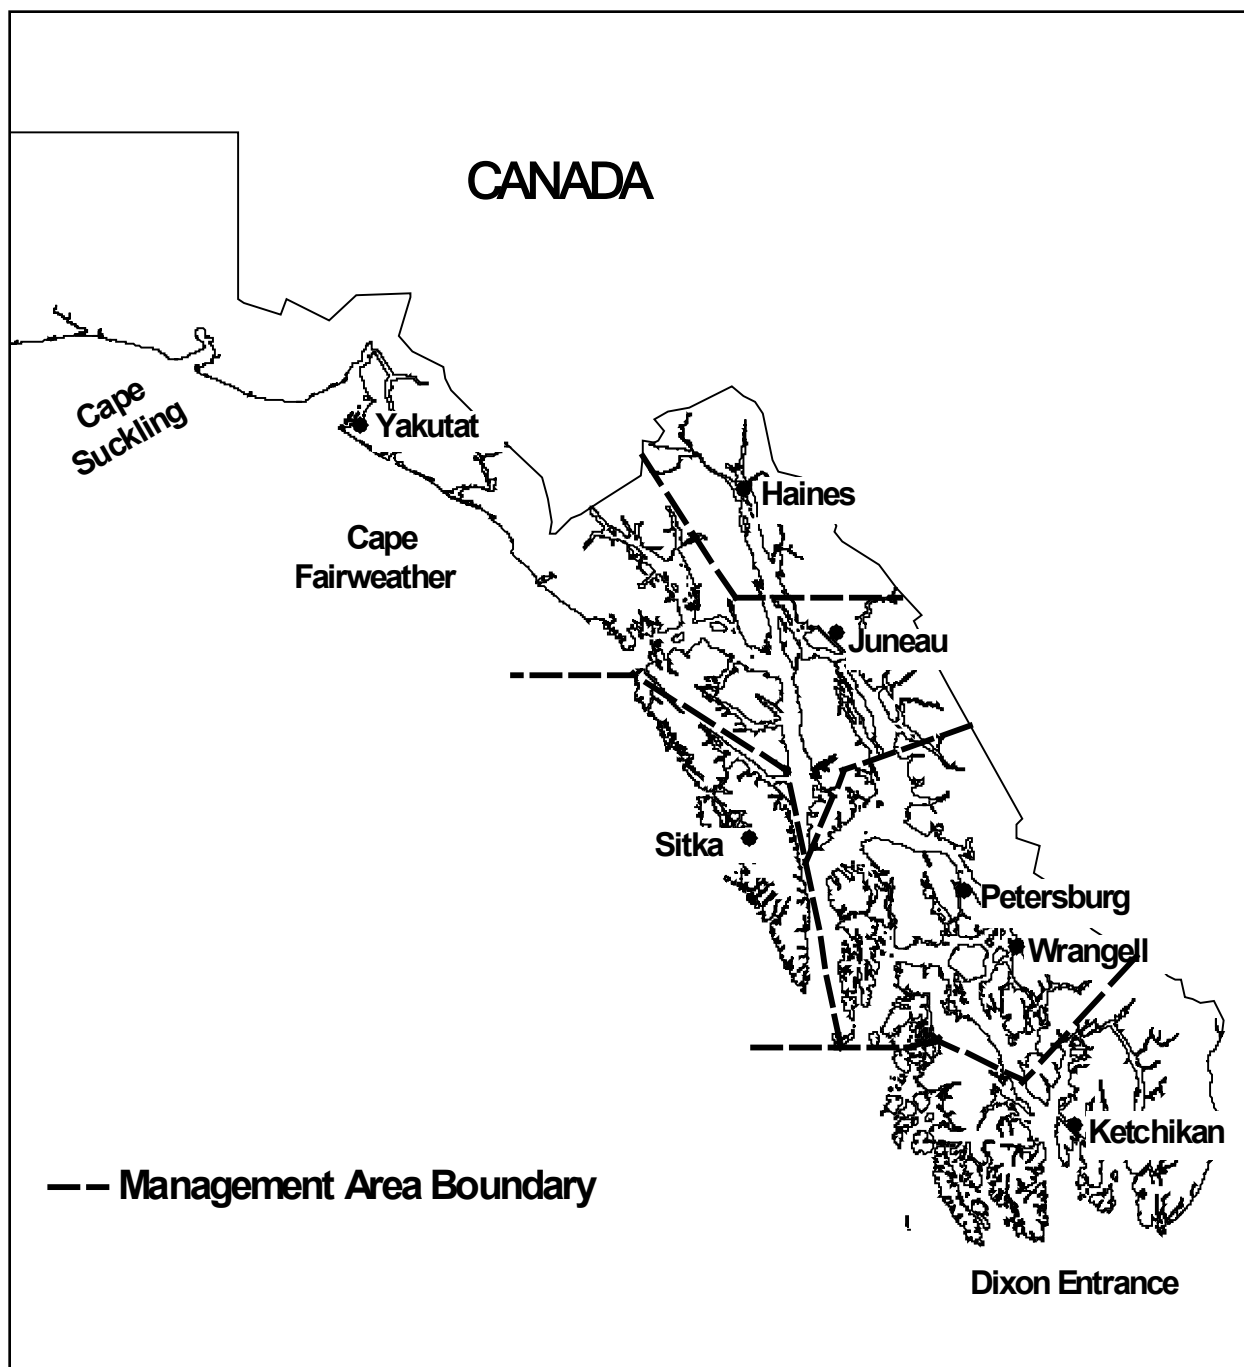

Figure 1.—Southeast Alaska consists of Alaska waters between Cape Suckling on the north and Dixon Entrance on the south. Troll fisheries are managed regionally, and drift gillnet, setnet, and purse seine fisheries are managed by area offices in Ketchikan, Petersburg/Wrangell, Sitka, Juneau, Haines, and Yakutat.

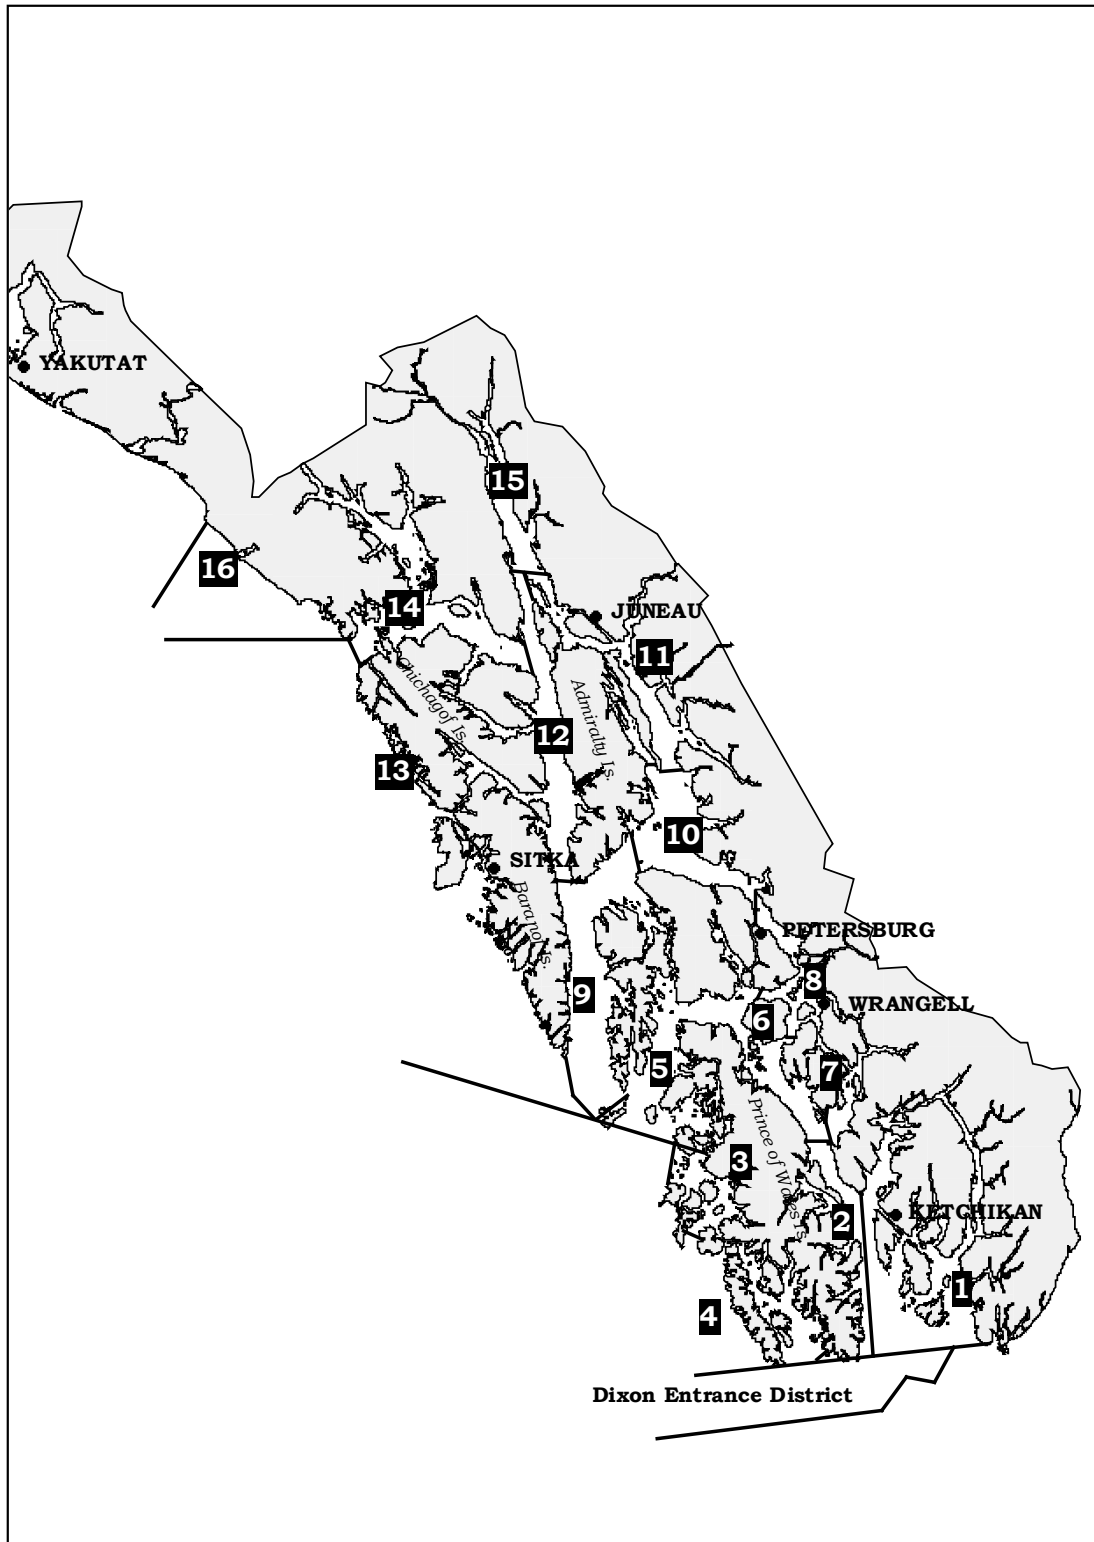

Figure 2.—Boundaries for regulatory Districts 1 to 16, as well as Dixon Entrance District, within Southeast Alaska.

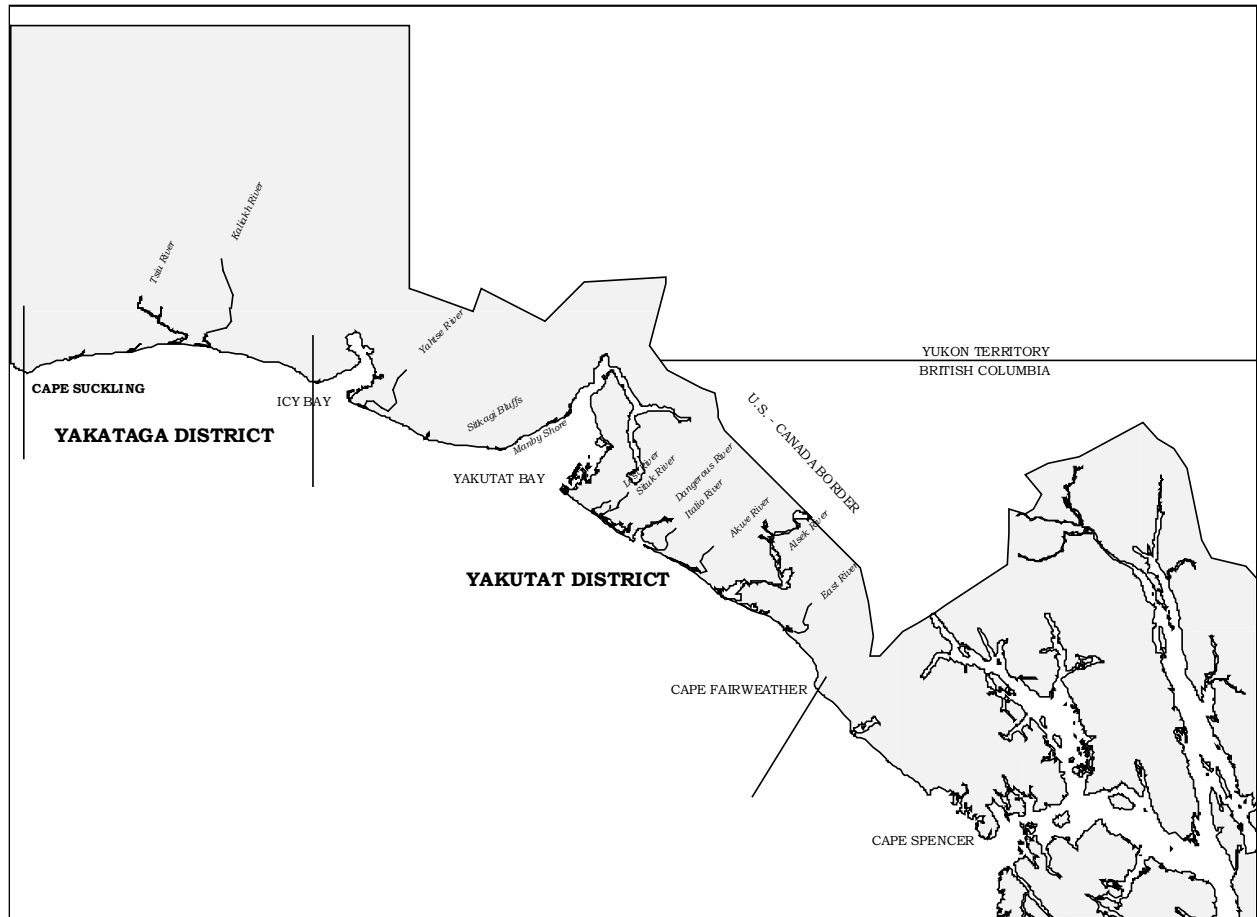

Figure 3.—Boundaries for Yakutat and Yakataga regulatory Districts within the Yakutat management area (Registration Area D).

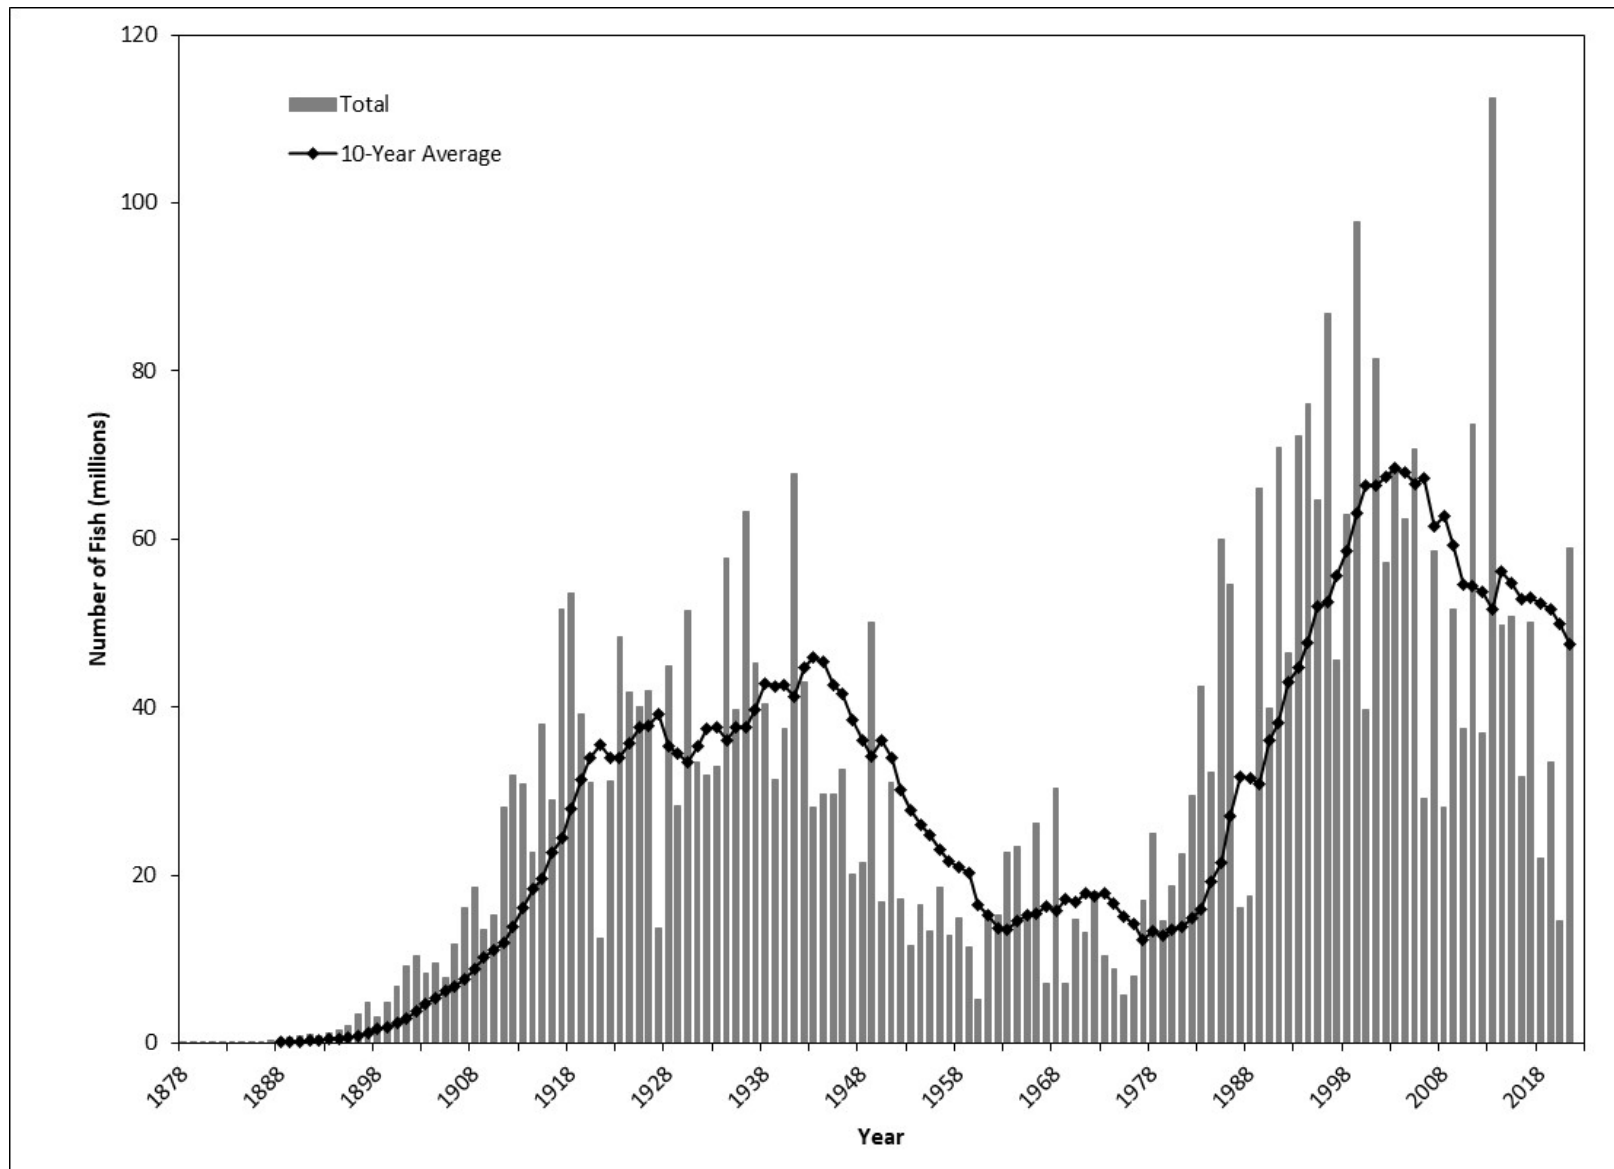

Figure 4.—Southeast Alaska historical salmon harvest and recent 10-year average harvest, 1878–2022.

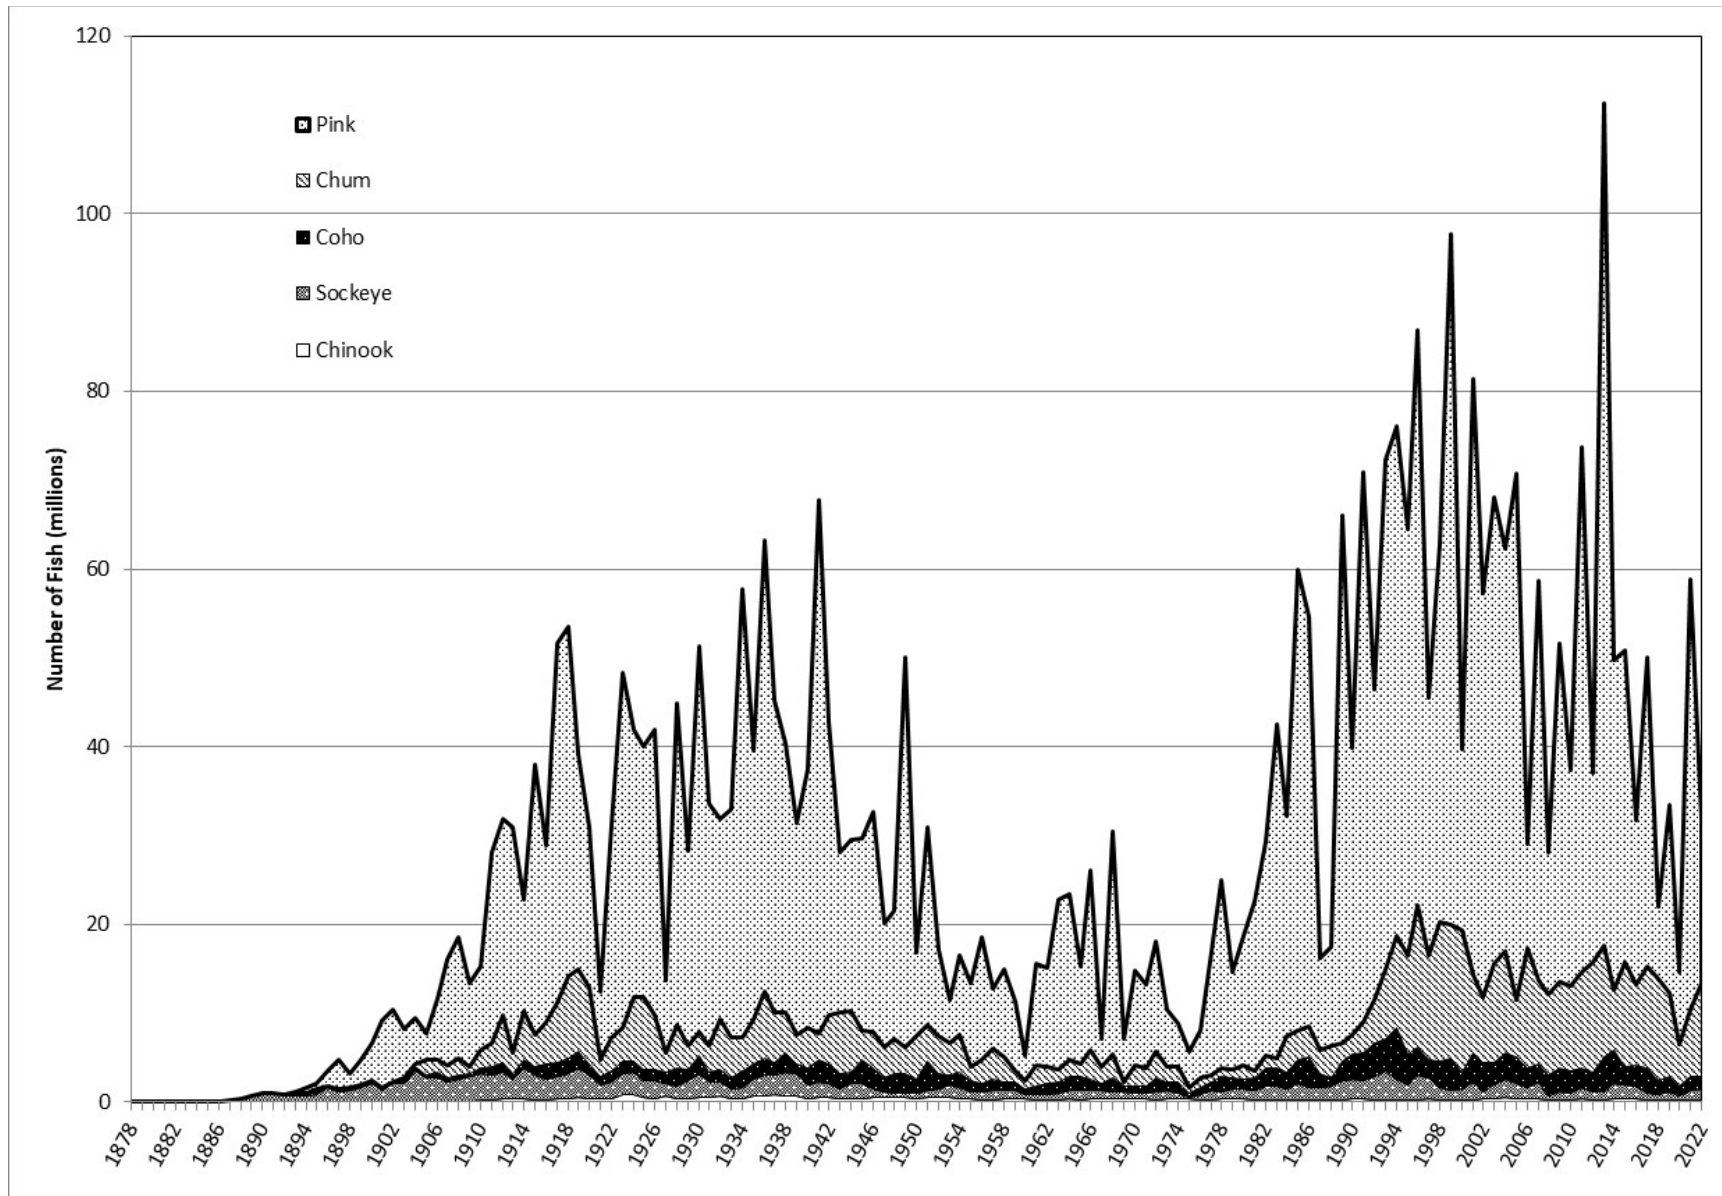

Figure 5.—Southeast Alaska historical salmon harvest by species and season, 1878–2022.

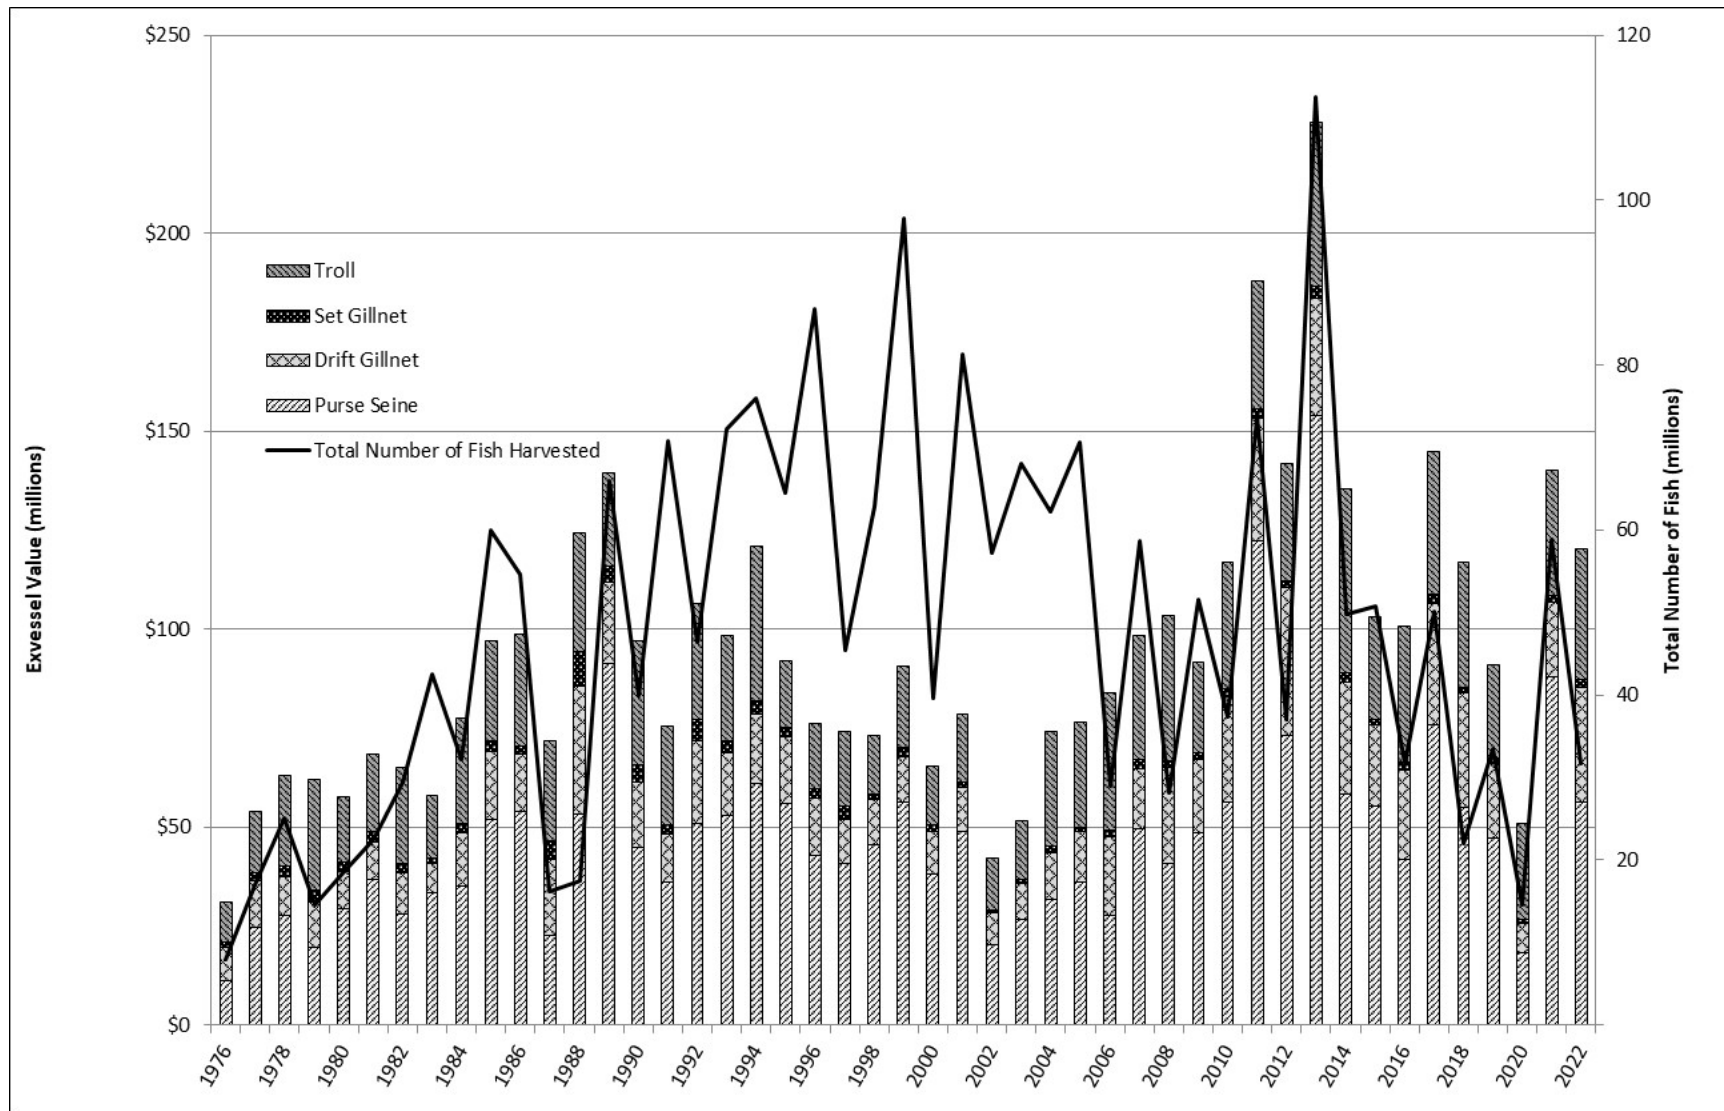

Figure 6.—Southeast Alaska total commercial exvessel value by gear type and season from Commercial Fisheries Entry Commission (1975–2021) and fish ticket (2022) data, and number of salmon harvested by season, 1975–2022.

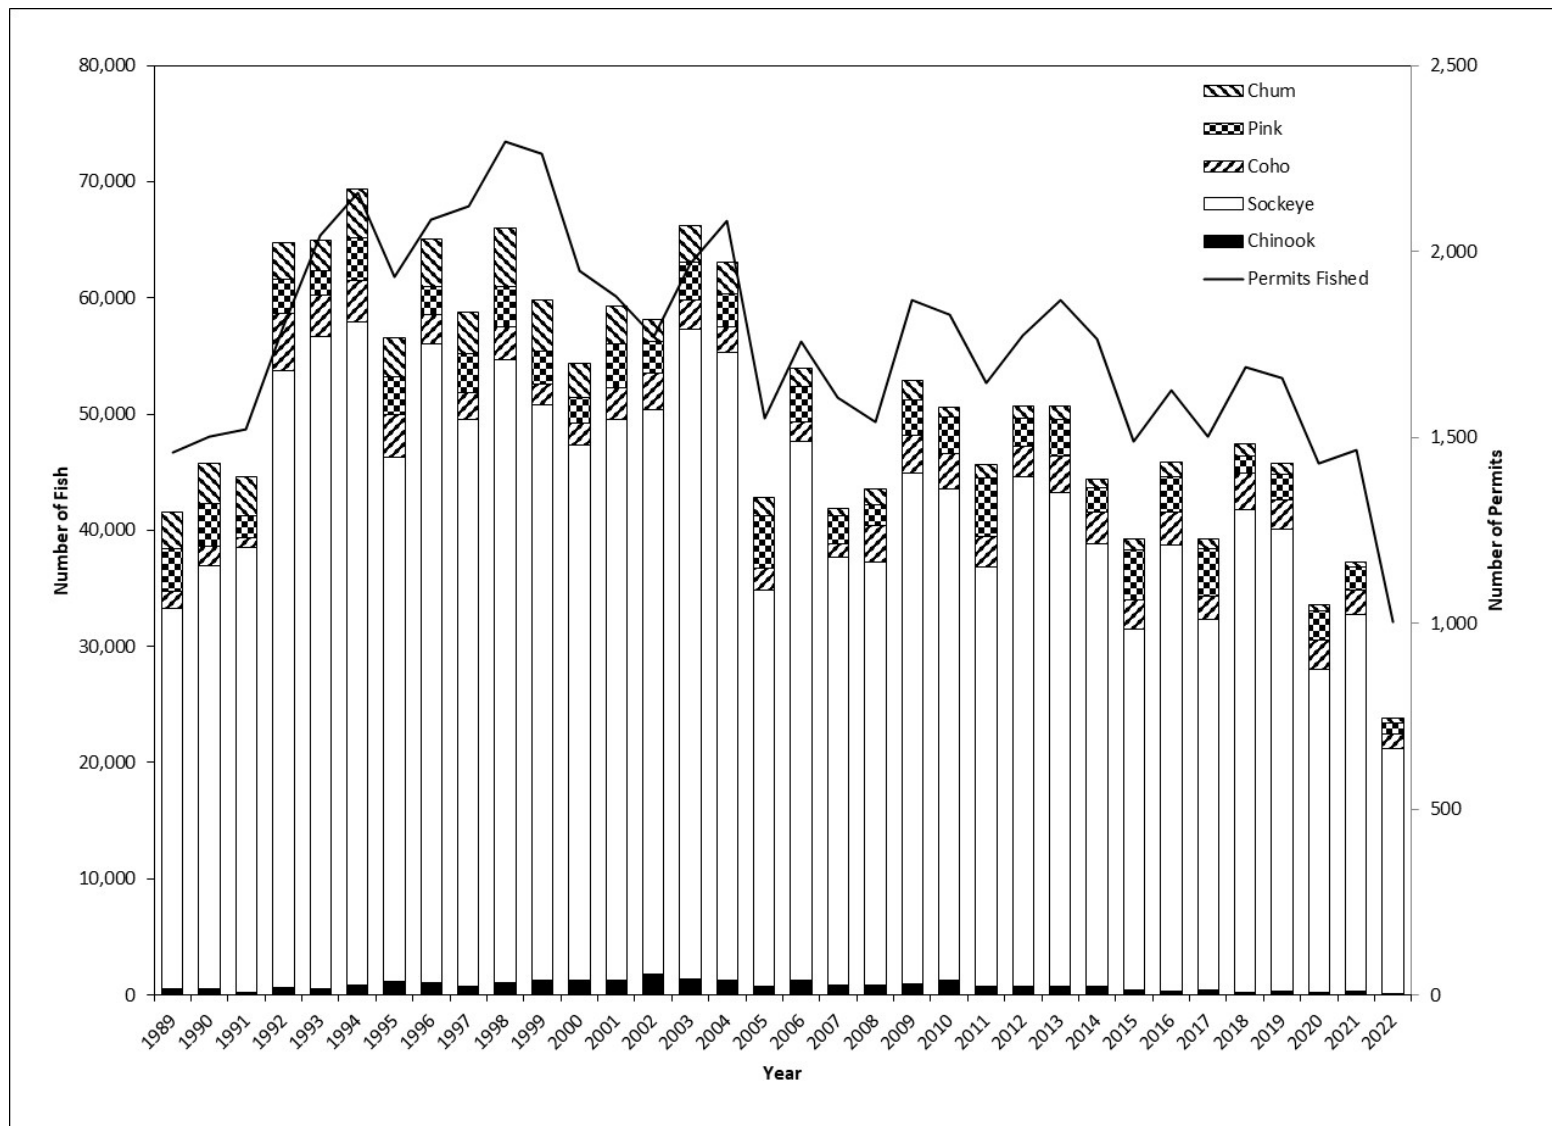

Figure 7.—Number of fish harvested by species and effort in the Southeast Alaska subsistence/personal use fishery, 1989–2022.
Note: Harvest information for 2022 is preliminary because not all permits had been returned at time of reporting.
