## Symbols and Abbreviations

The following symbols and abbreviations, and others approved for the Système International d'Unités (SI), are used without definition in the following reports by the Divisions of Sport Fish and of Commercial Fisheries: Fishery Manuscripts, Fishery Data Series Reports, Fishery Management Reports, and Special Publications. All others, including deviations from definitions listed below, are noted in the text at first mention, as well as in the titles or footnotes of tables, and in figure or figure captions.

| Weights and measures (metric) |  | General |  | Mathematics, statistics |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| centimeter | cm | Alaska Administrative |  | all standard mathematical |  |
| deciliter | dL | Code | AAC | signs, symbols and |  |
| gram | g | all commonly accepted |  | abbreviations |  |
| hectare | ha | abbreviations | e.g., Mr., Mrs., | alternate hypothesis | $\mathrm{H}_{\text {A }}$ |
| kilogram | kg |  | AM, PM, etc. | base of natural logarithm | $e$ |
| kilometer | km | all commonly accepted |  | catch per unit effort | CPUE |
| liter | L | professional titles | e.g., Dr., Ph.D., | coefficient of variation | CV |
| meter | m |  | R.N., etc. | common test statistics | (F, t, $\chi^{2}$, etc.) |
| milliliter | mL | at | @ | confidence interval | CI |
| millimeter | mm | compass directions: east | E | correlation coefficient (multiple) | R |
| Weights and measures (English) |  | north | N | correlation coefficient |  |
| cubic feet per second | $\mathrm{ft}^{3} / \mathrm{s}$ | south | S | (simple) | r |
| foot | ft | west | W | covariance | cov |
| gallon | gal | copyright | © | degree (angular) | - |
| inch | in | corporate suffixes: |  | degrees of freedom | df |
| mile | mi | Company | Co. | expected value | E |
| nautical mile | nmi | Corporation | Corp. | greater than | > |
| ounce | oz | Incorporated | Inc. | greater than or equal to | $\geq$ |
| pound | lb | Limited | Ltd. | harvest per unit effort | HPUE |
| quart | qt | District of Columbia | D.C. | less than | < |
| yard | yd | et alii (and others) | et al. | less than or equal to | $\leq$ |
|  |  | et cetera (and so forth) | etc. | logarithm (natural) | 1 n |
| Time and temperature |  | exempli gratia |  | logarithm (base 10) | $\log$ |
| day | d | (for example) | e.g. | logarithm (specify base) | $\log _{2}$, etc. |
| degrees Celsius | ${ }^{\circ} \mathrm{C}$ | Federal Information |  | minute (angular) |  |
| degrees Fahrenheit | ${ }^{\circ} \mathrm{F}$ | Code | FIC | not significant | NS |
| degrees kelvin | K | id est (that is) | i.e. | null hypothesis | $\mathrm{H}_{0}$ |
| hour | h | latitude or longitude | lat or long | percent | \% |
| minute | min | monetary symbols |  | probability | P |
| second | S | (U.S.) <br> months (tables and | \$, ¢ | probability of a type I error (rejection of the null |  |
| Physics and chemistry |  | figures): first three |  | hypothesis when true) | $\alpha$ |
| all atomic symbols |  | letters | Jan,...,Dec | probability of a type II error |  |
| alternating current | AC | registered trademark |  | (acceptance of the null |  |
| ampere | A | trademark | тм | hypothesis when false) | $\beta$ |
| calorie | cal | United States |  | second (angular) | " |
| direct current | DC | (adjective) | U.S. | standard deviation | SD |
| hertz | Hz | United States of |  | standard error | SE |
| horsepower | hp | America (noun) | USA | variance |  |
| hydrogen ion activity (negative $\log$ of) | pH | U.S.C. | United States Code | population sample | Var var |
| parts per million | ppm | U.S. state | use two-letter |  |  |
| parts per thousand | $\mathrm{ppt},$ $\%$ |  | abbreviations (e.g., AK, WA) |  |  |
| volts | V |  |  |  |  |
| watts | W |  |  |  |  |

## REGIONAL INFORMATION REPORT 3A21-03

# SALMON AGE, SEX, AND LENGTH CATALOG FOR THE KUSKOKWIM AREA, 2019 

by<br>Courtney L. Berry and Sean Larson<br>Alaska Department of Fish and Game, Division of Commercial Fisheries, Anchorage

April 2021

The Regional Information Report Series was established in 1987 and was redefined in 2007 to meet the Division of Commercial Fisheries regional need for publishing and archiving information such as area management plans, budgetary information, staff comments and opinions to Alaska Board of Fisheries proposals, interim or preliminary data and grant agency reports, special meeting or minor workshop results and other regional information not generally reported elsewhere. Reports in this series may contain raw data and preliminary results. Reports in this series receive varying degrees of regional, biometric and editorial review; information in this series may be subsequently finalized and published in a different department reporting series or in the formal literature. Please contact the author or the Division of Commercial Fisheries if in doubt of the level of review or preliminary nature of the data reported. Regional Information Reports are available through the Alaska State Library and on the Internet at: http://www.adfg.alaska.gov/sf/publications/.

Product names used in this publication are included for completeness and do not constitute product endorsement. The Alaska Department of Fish and Game does not endorse or recommend any specific company or their products

#### Abstract

Pacific salmon Oncorhynchus spp. age, sex, and length (ASL) data have been collected from Kuskokwim Area harvests and escapements since 1961. Since 1995, the salmon ASL catalog for the Kuskokwim Area has been produced to compile data summaries useful to Kuskokwim Area fishery managers, project leaders, and other interested parties. This report provides (1) an overview of projects that collected ASL data in 2019, (2) a single source document for project specific data summaries produced in 2019, (3) a historical summary of ASL data for select long-term monitoring projects, and (4) a quick reference guide to the available historical ASL data archived in the Arctic-YukonKuskokwim Database Management System. This report presents details of ASL sampling efforts that occurred during the 2019 season for the subsistence harvest, test fishery harvest, and escapement. Sampling during the 2019 season resulted in 6,707 salmon sampled for ASL. Chinook salmon $O$. tshawytscha made up $44 \%$ of the samples collected, followed by chum salmon $O$. keta at $26 \%$, sockeye salmon $O$. nerka at $20 \%$, and coho salmon $O$. kisutch at $10 \%$.

Key words: Pacific salmon, Oncorhynchus spp., age, sex, length, ASL, age class composition, sex composition, length composition, Arctic-Yukon-Kuskokwim Database Management System, AYKDBMS Kuskokwim River, Kuskokwim Bay.

## INTRODUCTION

Since 1961, age, sex, and length (ASL) data have been collected from Chinook Oncorhynchus tshawytscha, chum $O$. keta, sockeye $O$. nerka, and coho $O$. kisutch salmon returning to the Kuskokwim Management Area (Figure 1; Brannian et al. 2005). The Kuskokwim Area ASL sampling program collects data from salmon harvest and escapement monitoring projects operated throughout Kuskokwim River and Kuskokwim Bay. Standardized methods are used to collect ASL data (Eaton 2016) that can be used for a wide range of purposes, including management evaluation, trend analysis, and brood table development.

ASL data are available from discontinuous time series of sample collections from commercial, subsistence, and sport harvests, escapement monitoring projects, test fisheries, mark-recapture studies, and other special projects. A variety of organizations, including state, federal, tribal, and non-government groups, have jointly funded and participated in collecting Kuskokwim Area salmon ASL data. Primary data are archived in the Arctic-Yukon-Kuskokwim (AYK) Database Management System ${ }^{1}$ (AYKDBMS). The AYKDBMS is an online clearinghouse maintained by the Alaska Department of Fish and Game (ADF\&G) and provides a public interface for querying and downloading data. Since 1995, summarized data have been published by ADF\&G as part of the salmon ASL catalog for the Kuskokwim Area (Molyneaux and DuBois 1996, 1998, 1999; DuBois and Molyneaux 2000; Molyneaux and Folletti 2005, 2007; Molyneaux et al. 2006, 2008, 2009, 2010; Liller et al. 2013; Brodersen et al. 2013; Liller et al. 2015, 2016; Froning and Liller 2019a, 2019b). Before 2014, summarized ASL data was also reported in ADF\&G project reports and fisheries management reports. Beginning in 2014, ADF\&G project reports only provided information regarding data collection efforts (e.g., Head and Smith 2018). The salmon ASL catalog for the Kuskokwim Area is the only published source for ASL data summaries.

Salmon ASL data were collected at 9 projects within the Kuskokwim Area during 2019 (Table 1). Chinook salmon caught in the subsistence fishery were sampled for ASL throughout the 2019 season. The gear types used by subsistence fishermen and the timing of subsistence fishing activities were different compared to other sources of harvest (e.g., test fisheries). Therefore, dedicated sampling effort occurred for Chinook salmon harvested in the Lower Kuskokwim River

[^0]subsistence fishery, where most of the total subsistence harvest occurs (Liller et al. 2019). Chinook salmon were also sampled from a test fishery that operated in the lower portion of the Kuskokwim River near Bethel. Samples collected from the test fishery were assumed to be reasonably representative of the total run. ASL data were collected for all salmon species monitored at 7 weirs located on select spawning tributaries. The Goodnews River (Middle Fork) weir indexed salmon escapement to District 5 in Kuskokwim Bay. A weir operated on the George River indexed salmon escapement to the middle portion of the Kuskokwim River. A weir operated on the Kogrukluk River indexed salmon escapement to the Holitna river. The Telaquana River weir was used to index escapement of lake-spawning sockeye salmon. The Salmon (Pitka Fork) and Takotna river weirs provided an index of escapement to the headwaters of the Kuskokwim River drainage. A weir was operated on the Kwethluk River by the U.S. Fish and Wildlife Service (USFWS) to index salmon escapement to the lower portion of the Kuskokwim River. Data summaries for ASL data collected at the Kwethluk River weir in 2019 were published by USFWS and are not presented in this report.

The 2019 ASL catalog format provides a single source document for all ASL data collected by ADF\&G and partner organizations throughout the Kuskokwim Management Area. This document provides a general description of the methods used to collect ASL data and a detailed description of data processing, analysis, and archiving. This document provides standardized data summaries for all projects in 2019 and historical summaries for select long-term projects. This report format complements the AYKDBMS by providing a quick reference guide to the archived data by species, project type (e.g., harvest or escapement), project name, and year.

## OBJECTIVES

The goal of this project was to analyze and report salmon ASL samples collected from the Kuskokwim Area subsistence fishery, a test fishery, and escapement projects in 2019.
Specific objectives of this report were as follows:

1. Provide an overview of projects and methods used to collect ASL information in 2019,
2. Provide a single source document for detailed project ASL data summaries produced in 2019,
3. Provide a historical summary of annual ASL composition estimates for select long-term monitoring projects, and
4. Provide a quick reference guide to the available historical ASL data archived in the AYKDBMS.

## METHODS

In 2019, ASL samples were collected from 9 projects. Target species differed by project type and location (Table 1). Project types included a test fishery, subsistence catch, and escapement.

## SAMPLE SIzE

A minimum sample size was determined for each species to achieve $95 \%$ confidence intervals no wider than $\pm 10 \% ~(~ \alpha=0.05$ and $d=0.10$; Bromaghin 1993) for all major age-sex combinations (Table 2). Recommended sample sizes were increased by at least $20 \%$ to account for scales that could not be aged for various reasons. This minimum sample size was required to estimate the age-
sex composition for any location or temporal strata of interest. Viewed from a fixed location, such as an escapement project or a fishing district, the ASL composition of an upstream-migrating salmon population often changes over the season; therefore, sampling occurred throughout the season.

## Escapement Projects

ASL samples were collected using weirs with an integrated trap. Weir designs and specifications varied by location (Head and Smith 2018; Harper et al. 2018; and Webber and Harper 2018); however, all weirs functioned as a complete barrier to upstream movement for target species. Target species passed upstream of the weir through a designated chute. A trap was integrated into the passage chute at the upstream side of the weir. The trap included an entrance and exit gate that could be manually closed to capture salmon for sampling.

A daily sampling strategy was used for all salmon species sampled at Kuskokwim Area escapement monitoring locations. Daily sample goals were determined preseason by distributing the season's total sample size proportional to historical run timing. Daily sample schedules were adjusted as needed to account for observed run abundance. Furthermore, ADF\&G staff were given the discretion to modify the timing and intensity of daily sampling activities to accommodate other work priorities if the sum of the daily samples for each week of project operations met or exceeded a predetermined schedule.

## Commercial Harvest

There was no large-scale commercial harvest and only limited commercial opportunity for fishermen registered as catcher/sellers in the Kuskokwim Area during 2019. Therefore, there were no ASL summaries produced for commercial harvests for 2019. In prior years, samples were collected from commercial fish deliveries made to local processing plants in Bethel, Quinhagak, and Platinum, Alaska.

## SUBSISTENCE HARVEST

Opportunistic sampling was used to collect samples from the Chinook salmon subsistence harvest in the Lower Kuskokwim River (e.g., Liller et al. 2019). ADF\&G partnered with Orutsaramuit Native Council to recruit and train subsistence fishermen to sample their harvest and the harvest of others. Samplers were paid for each fish sampled. All interested individuals were encouraged to participate regardless of their fishing practices. Subsistence samplers were encouraged to sample from their entire harvest of Chinook salmon. It was assumed that a sufficiently large pool of subsistence fishermen would adequately represent the range of fishing practices implemented in the subsistence fishery. Samples collected in 2019 probably represented the total subsistence harvest in the Lower Kuskokwim River.

In 2019, a total of 25 people participated in the subsistence sampling program and sampled 1,508 Chinook salmon from 29 individual harvesters (Table 3). Most samples were collected from residents of Bethel ( $84 \%$ ). The remaining samples were collected from Tuntutuliak (6\%), Oscarville (1\%), and Napakiak (9\%). Samples were collected from Chinook salmon caught in gillnets with stretched mesh ranging from 5.25 -inches to 7.5 -inches (Table 4).

## Bethel Test Fishery

Census sampling was conducted for Chinook salmon harvested in the Bethel Test Fishery. An attempt was made to collect ASL samples from all fish harvested. Samples were collected from Chinook salmon harvested in the test fishery using 5.375 and 8.0 -inch drift gillnets.

## Age, Sex, and Length Sampling Procedures

To the extent practical, sampling procedures were standardized across all projects (Eaton 2016). A minimum of 3 scales for Chinook and coho salmon and 1 scale for chum and sockeye salmon were removed from the preferred area of the fish and mounted on gum cards for age determination by ADF\&G staff. The preferred area was located on the left side of the fish, 2 rows of scales above the lateral line, in an area crossed by a diagonal from the posterior insertion of the dorsal fin to the anterior insertion of the anal fin (INPFC 1963). Scales collected from the preferred area are less affected by scale regeneration or loss relative to other areas of the body and are a more complete record of total age. The sex of each salmon sampled was verified by visual examination of the gonads (harvest and test fishery projects) or visual examination of external characteristics (escapement projects). Fish length was measured from the mid eye to tail fork (METF) to the nearest millimeter using a straight edge measuring device.

## Age Estimation

Scales were used to determine the age of Chinook and chum salmon. Scales were mounted on gum cards during sampling and later impressed into cellulose acetate (Clutter and Whitesel 1956). Scale impressions were magnified and examined using a Microfiche reader. Age was determined by counting the number of freshwater and marine annuli. Annuli are the regions of the scale where the circuli, or growth rings, are tightly spaced relative to the preceding and proceeding circuli, representing slower growth rates associated with winter conditions (Mosher 1969). Freshwater annuli are distinguishable from saltwater annuli because the circuli formed in freshwater are finer and closer together than those formed while the fish was in the ocean (Major et al. 1972). Ages were recorded using European notation (Koo 1962), where the number of freshwater annuli is followed by a decimal and then the number of marine annuli. Total age from the brood year is the sum of freshwater and marine annuli plus 1 to account for time spent in the gravel before hatching.

## Estimates of Age, Sex, and Length Composition

The ASL composition of a returning salmon population often changes over the course of the season (Molyneaux et al. 2006); therefore, sample proportions may not be representative if samples were not collected in proportion to the run, harvest, or escapement. Samples collected from escapement projects were grouped into time strata, and the sample proportions from each stratum were applied to the escapement for each respective stratum, to account for seasonal changes in ASL composition (Tables 5-8). Attempts were made to include a sufficient sample size within each stratum to estimate the proportion of each major age class and obtain a $95 \%$ confidence interval width no greater than $10 \%$ of the estimate (Bromaghin 1993). The escapement or harvest by date was provided by project leaders and ADF\&G fish ticket harvest reports.
For projects where sample ASL estimates were applied to the escapement, the proportion of fish of age class $(a)$ of sex $(s)$ during the stratified period $(i)$ was estimated as:

$$
\begin{equation*}
\hat{p}_{a, s, i} \frac{n_{a, s i}}{n_{i}}, \tag{1}
\end{equation*}
$$

where $n_{a, s, i}$ is the number of samples for age class (a) of sex $(s)$ in stratified period ( $i$ ), and $n_{i}$ is the number of samples in stratified period (i).
The number of fish of specific age class $(a)$ and sex $(s)$ during a stratified period (i) was estimated as:

$$
\begin{equation*}
\widehat{N}_{a, s, i}=\hat{p}_{a, s, i} N_{i} \tag{2}
\end{equation*}
$$

where $N_{i}$ is the number of fish during the stratified period ( $i$ ).
When data for all strata were available, the season total proportion of fish of specific age (a) and sex ( $s$ ) was estimated as:

$$
\begin{equation*}
\hat{p}_{a, s}=\frac{1}{N} \sum_{i} N_{i} \hat{p}_{a, s, i}, \tag{3}
\end{equation*}
$$

where:

$$
\begin{equation*}
N=\sum_{i} N_{i} \tag{4}
\end{equation*}
$$

The season total number of fish of specific age $(a)$ and sex $(s)$ was estimated as:

$$
\begin{equation*}
\hat{N}_{a, s}=\sum_{i} \hat{N}_{a, s, i} \tag{5}
\end{equation*}
$$

The season total age proportion was estimated as:

$$
\begin{equation*}
\hat{p}_{a}=\frac{1}{N} \sum_{i} \sum_{s} N_{i} \hat{p}_{a, s, i} . \tag{6}
\end{equation*}
$$

The season total female proportion was estimated as:

$$
\begin{equation*}
\hat{p}_{s=f}=\frac{1}{N} \sum_{i} \sum_{a} N_{i} \hat{p}_{a, s=f, i} . \tag{7}
\end{equation*}
$$

Mean length for fish of age $(a)$ and $\operatorname{sex}(s)$ in stratified period $(i)$ was estimated as:

$$
\begin{equation*}
\bar{y}_{a, s, i}=\frac{\sum_{j} y_{a, s, i, j}}{n_{a, s, i}} \tag{8}
\end{equation*}
$$

where $y_{a, s, i, j}$ is the length of fish $(j)$ of age $(a)$ and sex $(s)$, sampled during period $(i)$, with a standard error (se) of:

$$
\begin{equation*}
s e=\sqrt{\frac{s_{a, s, i}^{2}}{n_{a, s, i}}} \tag{9}
\end{equation*}
$$

where:

$$
\begin{equation*}
s_{a, s, i}^{2}=\frac{\sum_{j}\left(y_{a, s, i, j}-\bar{y}_{a, s, i}\right)^{2}}{n_{a, s, i}-1} . \tag{10}
\end{equation*}
$$

When data for all strata were available, season total mean length for fish of age (a) and sex $(s)$ were estimated as:

$$
\begin{equation*}
\bar{y}_{a, s}=\frac{1}{N_{a, s}} \sum_{i} N_{a, s, i} \bar{y}_{a, s, i} \tag{11}
\end{equation*}
$$

with a standard error of:

$$
\begin{equation*}
s e=\sqrt{\hat{V}\left(\bar{y}_{a, s}\right)}, \tag{12}
\end{equation*}
$$

where:

$$
\begin{equation*}
\hat{V}\left(\bar{y}_{a, s}\right)=\frac{1}{N_{a, s}^{2}} \sum_{i} N_{a, s, i}^{2} \hat{V}\left(\bar{y}_{a, s, i}\right) \tag{13}
\end{equation*}
$$

and

$$
\begin{equation*}
\hat{V}\left(\bar{y}_{a, s, i}\right)=\left(\frac{s_{a, s, i}^{2}}{n_{a, s, i}}\right) . \tag{14}
\end{equation*}
$$

Season total ASL summaries were produced for each project. For each project, data summaries were presented in a consistent manner using a table format which included sample dates, sample size, numbers of fish, percentage of fish, and mean length organized by brood year (age) for males, females, and both sexes combined. Additional summary information was provided about the 2019 ASL data collection at each project, including the total number of each data type (age, sex, or length) collected, the number of scale samples successfully aged, and the percentage of samples used to estimate ASL composition (Tables 9-12).

## Historical Data Summaries

Historical ASL data summaries were produced to allow identification of temporal trends in ASL composition at select projects. Each historical summary presents the sample size, percent by age and sex, and mean length for each year the project operated for samples that contained all 3 ASL components. Data used to produce historical summaries were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. The unweighted historical estimates provided in this report may differ from historical ASL data summaries published in other reports, which may be weighted or had adjustment factors applied. Historical estimates provided here match the publicly available estimates in the AYKDBMS; however, weighted estimates can be produced independently or found in annual project reports.

## Archiving and User Generated Reports

Raw data forms, scale cards, and acetate impressions were archived in the ADF\&G, Anchorage Regional Office, and ASL data were archived and made publicly accessible in the AYKDBMS. By selecting the "Search" link on the main database page, users will be directed to a series of data filters that allow for focused searches by management area, data type, project type, species group, and species. The user can also access an alphabetical list of all available projects by selecting the "Go to Projects" link on the data filters page. Selection of a specific project will yield a general project description and annual year notes that provide context (i.e., metadata) regarding the type, quality, quantity, and utility of the data available. An ASL link will be visible under "Available Data Views by Data Type" if ASL data are available for the selected project. If data are available
and the "ASL" link is selected, the user will be prompted to select a specific year(s) for which ASL data are desired. Once the year(s) is selected and the user selects "Go to Data View", a report will be generated with all the data associated with each fish sampled including information about data collection (e.g., date of sample, location, method of capture, method of sex determination, etc.), archival references (i.e., scale card number and fish number), and primary biological data (e.g., freshwater age, saltwater ASL). The reports are generated online; however, users can export them into Microsoft Excel or other formats (CSV, tab delimited, PDF etc.). Similarly, information pertaining to many of the assessment projects where ASL samples are collected are also available within the AYKDBMS. Assessment information includes metadata, year operational notes, CPUE from test fisheries, and escapement estimates.

## RESULTS

## 2019 SEASON

A total of 6,707 salmon were sampled for age, sex, or length during the 2019 season. Chinook salmon made up $44 \%$ of the samples collected, followed by chum salmon ( $26 \%$ ), sockeye salmon ( $20 \%$ ), and coho salmon ( $10 \%$ ). All projects attempted to collect paired ASL data from each fish. Although age samples were collected for most fish sampled, not all fish could be successfully aged (Tables 9-12). Overall, the percentage of Chinook, chum, sockeye, and coho salmon scales that were successfully aged was $86 \%, 95 \%, 84 \%$, and $78 \%$, respectively.

ASL data collected in 2019 were summarized by project for each salmon species sampled. Chinook salmon summaries include 1 test fishery operated near Bethel (Table 13), subsistence harvest composition from the Lower Kuskokwim River (Table 14), 1 weir operated in Kuskokwim Bay (Table 15), and 4 weirs operated in tributaries throughout the Middle and Upper Kuskokwim River (Tables 16-19). Chum salmon summaries include 1 weir operated in Kuskokwim Bay (Table 20) and 2 weirs operated in tributaries of the Middle Kuskokwim River (Tables 21-22). Sockeye salmon summaries include 1 weir operated in Kuskokwim Bay (Table 23) and 2 weirs operated in tributaries of the Middle Kuskokwim River (Tables 24-25). Coho salmon summaries include 2 weirs operated in tributaries of the Middle Kuskokwim River (Tables 26-27).

## Historical Data Summaries

Historical summaries were produced for select projects. Historical ASL data summaries for Chinook salmon include commercial harvest composition from 1 Kuskokwim River (Table 28) and 2 Kuskokwim Bay (Tables 29-30) subdistricts, 1 test fishery near Bethel (Table 31), subsistence harvest composition from the Lower Kuskokwim River (Table 32), 2 escapement monitoring weir projects located on tributaries that drain into Kuskokwim Bay (Tables 33-34), and 5 escapement monitoring weirs operated in tributaries throughout the Middle and Upper Kuskokwim River (Tables 35-39). Historical ASL summaries for chum salmon include commercial harvest composition from 1 Kuskokwim River (Table 40) and 2 Kuskokwim Bay (Tables 41-42) subdistricts, 2 escapement monitoring weir projects located on tributaries that drain into Kuskokwim Bay (Tables 43-44), and 4 escapement monitoring weirs operated in tributaries throughout the Middle Kuskokwim River (Tables 45-48). Historical ASL summaries for sockeye salmon include commercial harvest composition from 1 Kuskokwim River (Table 49) and 2 Kuskokwim Bay (Tables 50-51) subdistricts, and 2 escapement monitoring weir projects located on tributaries that drain into Kuskokwim Bay (Tables 52-53). Historical ASL summaries for coho salmon include commercial harvest composition from 1 Kuskokwim River (Table 54) and 2

Kuskokwim Bay (Tables 55-56) subdistricts, and 4 escapement monitoring weirs operated in tributaries throughout the Middle Kuskokwim River (Tables 57-60).

## Kuskokwim Area ASL Data in the AYKDBMS

The goal of the AYKDBMS is to provide managers, researchers, and the public involved in fisheries in the AYK Region with a system to enter and process new data, as well as to retrieve historical data. The AYKDBMS provides access to Kuskokwim Area project descriptions and biological measurements of salmon ASL. A comprehensive list of all Kuskokwim Area projects that have collected salmon ASL data and the years data are available for each salmon species. Tables were developed by querying data directly from the AYKDBMS. Overview tables provide a quick reference for ADF\&G staff and members of the public who may be interested in Kuskokwim Area ASL data for independent research but are unfamiliar with the scope of the data available. The AYKDBMS contains Chinook salmon ASL data collected from 27 different projects (Table 61), chum salmon data from 24 projects (Table 62), sockeye salmon data from 27 projects (Table 63), and coho salmon data from 19 projects (Table 64). For each salmon species, ASL data are available from a range of project types, including commercial catch, subsistence catch, escapement monitoring, mark-recapture experiments, and test fisheries. The length and continuity of the time series of available data vary considerably within and between project types (Tables 61-64).

## DISCUSSION

## Sources of Bias

Users of Kuskokwim Area ASL data are responsible for ensuring that all data used are appropriate for the intended purpose. Since 1961, numerous changes have occurred regarding how fisheries and fisheries monitoring projects have been executed, including how ASL data are collected, processed, and analyzed. Examples of differences between project types or between years at the same project include (1) changes in harvest regulation including time, area, and gear restrictions; (2) changes in capture methods including weir picket spacing and gillnet dimensions and mesh sizes; (3) differences in length measurement methods including cloth tape, hard rulers, fish cradles, and calipers; (4) changes in method used to sex fish, including using internal or external characteristics; (5) changes in ADF\&G staff responsible for collection and processing ASL samples; and (6) changes in study design, including assumptions and sample size requirements. Prospective users are encouraged to review the original reports or other sources to understand the methods used for specific ASL data collections, including any changes in methodology.

There is potential for bias caused by small sample sizes and scale absorption and collection methods. The collection of regenerated scales was the primary reason some ages could not be read in 2019. Scale absorption refers to the margin of the scale being absorbed as an energy reserve in the last few weeks of a salmon's life (Clutter and Whitesel 1956). Scale absorption normally becomes more pronounced the farther upriver the samples are collected and can lead to underestimating saltwater age because less of the outermost annulus remains. Vertebra or otolith sampling can alleviate issues with resorbed scales but are more time-consuming methods of collection and reading. Bias may also exist in weir sampling towards smaller fish when larger fish are more reluctant to enter a confined weir trap structure and be available for live sampling. Though "trap shyness" has yet to be scientifically evaluated, users of these data should be aware
that this potential bias exists. Previous versions of the Kuskokwim Area ASL catalog also provide some examples of bias and data quality concerns (e.g., Molyneaux et al. 2010).

## Data Quality, AYKDBMS

The AYKDBMS was populated with data archived in various formats, including paper data forms, digital scan forms, spreadsheets, and other database programs. Considerable care was taken to reduce transcription errors during the data upload process. However, some of the Kuskokwim Area ASL data in the AYKDBMS has not been reviewed for errors. As such, some unknown level of data transcription errors, incorrect labeling, and erroneous data may exist in the database. ADF\&G stock biologists, who regularly use the database, generally agree that fewer errors exist for data collected after 2000. Earlier data should be used with caution and, if a data quality concern exists, users are encouraged to contact ADF\&G staff for assistance.
The AYKDBMS provides project leaders with tools for archiving metadata. To date, the level of metadata available for database users is not sufficient. Kuskokwim Area ADF\&G staff provides general project descriptions, methods, and project year notes in the AYKDBMS. However, the AYKDBMS does not currently provide details regarding aging or methods for estimating ASL composition. Users of the database should review annual project reports or consult ADF\&G staff for information regarding data collection and limitations.

## ACKNOWLEDGEMENTS

We would like to acknowledge the many technicians from ADF\&G, Orutsararmiut Native Council, Native Village of Napaimute, MTNT Ltd., and USFWS who participated in salmon monitoring activities. We also thank Bobette Dickerson for providing estimates of escapement, and Bill Bechtol of the Bering Sea Fisherman's Association, and Janessa Esquible of Orutsararmiut Native Council for their assistance in the subsistence sampling program. We would like to thank Jim O'Rourke for aging thousands of Kuskokwim Area salmon. Lastly, thanks to Toshihide Hamazaki for reviewing estimation methods and data analysis templates.

## TABLES AND FIGURES

Table 1.-Projects and salmon species for which ASL data were collected in 2019.

| Project type | Location | $\begin{gathered} \text { River } \\ \text { km } \\ \hline \end{gathered}$ | Species |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Chinook | Sockeye | Chum | Coho |
| Test fishery | Bethel | 111 | X |  |  |  |
| Subsistence catch | Lower Kuskokwim River | a | X |  |  |  |
| Escapement | Goodnews (Middle Fork) | b | X | X | X |  |
|  | Kwethluk River ${ }^{\text {c }}$ | 216 | X | X | X |  |
|  | George River | 453 | X |  | X | X |
|  | Kogrukluk River | 710 | X | X | X | X |
|  | Takotna River | 752 | X |  |  |  |
|  | Telaquana River | 772 |  | X |  |  |
|  | Salmon River (Pitka Fork) | 916 | X |  |  |  |

Note: The " X " designates that samples were collected. All escapement projects were weirs. Harvest and test fisheries used gillnets of variable mesh size.
a The Lower Kuskokwim River consists of all waters between the Kuskokwim Bay and the Village of Tuluksak and approximates District W1.
b Flows into Goodnews Bay and District W5.
c Data were collected and processed by U.S. Fish and Wildlife Service and are not presented in this report. Data will be added to the Arctic Yukon Kuskokwim Database Management System.

Table 2.-Minimum sample size requirements to estimate salmon ASL composition in 2019.

| Species | Number <br> categories $^{\text {a }}$ | Sample size $^{\mathrm{b}}$ | Adjusted sample <br> size $^{\text {c }}$ |
| :--- | :---: | :---: | ---: |
| Chinook | 8 | 190 | 230 |
| Sockeye | 6 | 205 | 230 |
| Chum | 4 | 180 | 220 |
| Coho classes ${ }^{\text {d }}$ |  |  |  |

a Age/sex categories.
b From Bromaghin 1993, $\alpha=0.05, d=0.1$. Does not include correction for small population size.
c Increased by approximately $20 \%$ to account for unagable scales
d Common age classes that make up at least $1 \%$ of historical average. Other category is made up of all minor age classes which in aggregate generally account for $<1 \%$ of historical average.

Table 3.-Sample collections by community residents used to represent the ASL composition of Chinook salmon harvested in lower Kuskokwim River subsistence fishery, 2019.

| Location | River km | Number of <br> samplers | Harvests <br> sampled $^{\text {a }}$ | Sample size ${ }^{\text {b }}$ | Percent |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Tuntutuliak | 45 | 1 | 2 | 87 | 6 |
| Bethel | 106 | 22 | 25 | 1,260 | 84 |
| Oscarville | 132 | 1 | 1 | 21 | 1 |
| Napakiak | 143 | 1 | 1 | 140 | 9 |
| Total |  | 25 | 29 | 1,508 | 100 |

${ }^{\text {a }}$ Participants were encouraged to sample from as many households as possible.
${ }^{\text {b }}$ Sample sizes include Chinook salmon whose age could not be determined.

Table 4.-Percent of samples collected by gillnet mesh size in the lower and middle Kuskokwim River Chinook salmon subsistence fishery, 2019.

|  | Tuntutuliak <br> $(\mathrm{n}=87)$ | Oscarville <br> $(\mathrm{n}=21)$ | Bethel <br> $(\mathrm{n}=1,260)$ | Napakiak <br> $(\mathrm{n}=140)$ | Total <br> $(\mathrm{n}=1,508)$ |
| :--- | ---: | ---: | ---: | ---: | ---: |
| ${\text { Mesh size }{ }^{a}}^{5.25 \text { inch }}$ |  |  | $2.0 \%$ |  | $2.0 \%$ |
| 5.5 inch | $0.7 \%$ |  | $21.1 \%$ | $9.2 \%$ | $31.0 \%$ |
| 5.625 inch |  |  | $1.5 \%$ |  | $1.5 \%$ |
| 5.875 inch | $0.3 \%$ |  | $8.8 \%$ |  | $9.1 \%$ |
| 6.0 inch | $1.3 \%$ | $1.4 \%$ | $50.2 \%$ |  | $52.9 \%$ |
| 7.0 inch | $0.6 \%$ |  |  |  | $0.6 \%$ |
| 7.5 inch | $2.9 \%$ |  |  |  | $2.9 \%$ |
| Total | $5.8 \%$ | $1.4 \%$ | $83.6 \%$ | $9.2 \%$ | $100.0 \%$ |

Note: Sample sizes include Chinook salmon whose age could not be determined.
a Drift and set gillnets combined.

Table 5.-Postseason stratification used to account for disproportionate sampling of Chinook salmon at ASL escapement projects in the Kuskokwim Area, 2019.

| Project location | Stratum | $\begin{array}{r} \text { Sample } \\ \text { size } \\ \hline \end{array}$ | Escapement | Stratum dates | Sample dates |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Goodnews River (Middle Fork) | 1 | 41 | 684 | 6/22-7/4 | 6/27-7/1, 7/3-7/4 |
|  | 2 | 100 | 800 | 7/5-7/31 | 7/5-7/16, 7/18-7/19, 7/21, 7/23-7/26 |

|  | 4 | 61 | 842 | 7/15-9/20 | 7/15-7/17, 7/19-7/24, 7/26-7/29, 8/1-8/5 |
| Kogrukluk River | 1 | 135 | 2,912 | 6/26-7/11 | 6/27-6/28, 7/1-7/3, 7/5-7/6, 7/8-7/11 |
|  | 2 | 78 | 3,696 | 7/12-7/21 | 7/13-7/20 |
|  | 3 | 45 | 3,690 | 7/22-9/18 | 7/22-7/26, 7/28-7/29, 7/31-8/1, 8/3 |
| Takotna River ${ }^{\text {a }}$ | 1 | 87 | 540 | 7/1-8/5 | 7/1-7/2, 7/7-7/10, 7/12-7/31, 8/2 |
| Salmon River (Pitka Fork) | 1 | 73 | 2,215 | 6/17-7/8 | 6/30-7/2, 7/5-7/8 |
|  | 2 | 108 | 2,579 | 7/9-8/13 | 7/9-7/10, 7/12-7/14, 7/16-7/25, 7/30-7/31, 8/3 |

Note: Disproportionate sampling was addressed postseason by stratifying the total escapement by the timing of sample collection. Stratum estimates were weighted by the proportion of the total escapement and combined to estimate the overall age and sex composition and mean length of the entire escapement.
${ }^{\text {a }}$ Sample size was not sufficient to stratify and apply to escapement.

Table 6.-Postseason stratification used to account for disproportionate sampling of chum salmon at ASL monitoring projects in the Kuskokwim Area, 2019.

|  |  |  |  |  |  |
| :---: | :---: | ---: | ---: | ---: | ---: |
| Project location | Stratum | Sample size | Escapement | Stratum dates | Sample dates |

| $\begin{aligned} & \text { Average } \\ & (1964- \\ & 2015) \end{aligned}$ | 330 | 22,370 | 0.4 | 0.1 | 24.1 | 0.1 | 30.7 | 0.3 | 38.4 | 0.6 | 4.5 | 0.7 | 0.0 | 0.1 | 33.4 | 749 |

Note: Harvest totals are Districts W1 and W2 combined. From 1964 to 1971 mesh size was unrestricted, from 1972 to 1984, both restricted ( $\leq 6$ inch) and unrestricted mesh sizes were used, since 1985 mesh size has been restricted ( $\leq 6$ inch). Harvest totals exclude fish kept for personal use. Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
a ASL data were not collected.
${ }^{\text {b }}$ Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
c Samples were collected, are archived at ADF\&G, but data are not available through the AYKDBMS.
d Sale of Chinook salmon was prohibited.
No commercial fishery occurred.

Table 30.-Page 2 of 2.
Note: From 1990 to 2012 restricted mesh ( $\leq 6 \mathrm{inch}$ ) gillnets were used. ASL samples are available discontinuously back to 1973 but summaries have not been produced. Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
a Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
b ASL data were not collected.
c Only age composition and length data were collected
d No commercial fishery occurred.

Note: Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
a Weir did not operate for most of the season. Only observed escapement counts are presented.
b ASL data were not collected.
c Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
d All 1990 scales need re-aged due to potential errors.

Note: Commercial sockeye salmon fishery was executed using restricted mesh ( $\leq 6$ inch) gillnets. Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
a Only age composition and length data were collected
${ }^{\text {b }}$ Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
c Samples were collected, are archived at ADF\&G, but data are not available through the AYKDBMS. Composition, if shown, represents samples collected only.
d ASL data were not collected.
e No commercial fishery occurred.

Note: Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
a Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
b Weir did not operate for most of the season. Only observed escapement counts are presented.

Note: Harvest data are from Districts W1 and W2 combined. The commercial sockeye salmon fishery was executed using restricted mesh ( $\leq 6$ inch) gillnets. Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
${ }^{\text {a }}$ ASL data were not collected.
${ }^{\mathrm{b}}$ Only age composition and length data were collected.
${ }^{c}$ Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
${ }^{\mathrm{d}}$ Samples were collected, are archived at ADF\&G, but data are not available through the AYKDBMS.
${ }^{\mathrm{e}}$ No commercial fishery occurred.

Note: Commercial sockeye salmon fishery was executed using restricted mesh ( $\leq 6$ inch) gillnets. Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
${ }^{\text {a }}$ Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
e Only age composition and length data were collected.
${ }^{\text {b }}$ Samples were collected, are archived at ADF\&G, but data are not available through the AYKDBMS. Composition, if shown, represents samples collected only.
c ASL data were not collected.
d No commercial fishery occurred.

Note: Commercial coho salmon fishery was executed using small mesh ( $\leq 6$ inch) gillnets. Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
a Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
b ASL data were not collected.
c Samples were collected, are archived at ADF\&G, but data are not available through the AYKDBMS.
d No commercial fishery occurred.

Note: Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
a Weir did not operate.
b Weir did not operate for most of the season. Only observed escapement counts are presented.
c Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
d Samples were lost.
e Weir did not operate during coho run.

[^1]:    -continued-

[^2]:    -continued-

[^3]:    -continued-

[^4]:    Note: Bethel test fishery uses a 5.375 inch and 8.0 inch drift gillnet to index run timing and relative abundance of Chinook salmon. Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
    a Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
    b ASL data were not collected.

[^5]:    Note: Samples were collected by subsistence fishermen who sampled their own harvests or the harvests of others. Age and sex percentages and mean length were calculated separately using all fish and may differ from annual summaries that are based on a subset of fish with a complete record of paired ASL data. Mesh sizes used in the subsistence fishery have changed over time. Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates.

[^6]:    Note: Commercial chum salmon fishery was executed using restricted mesh ( $\leq 6$ inch) gillnets. Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
    a Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
    b Only age composition and length data were collected
    c Samples were collected, are archived at ADF\&G, but data are not available through the AYKDBMS.
    ${ }^{d}$ No commercial fishery occurred.

[^7]:    Note: Commercial chum salmon fishery was executed using restricted mesh ( $\leq 6$ inch) gillnets. Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
    a Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
    ${ }^{\text {b }}$ Samples were collected, are archived at ADF\&G, but data are not available through the AYKDBMS.
    c ASL data were not collected.
    d No commercial fishery occurred.

[^8]:    Note: Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
    ${ }^{\text {a }}$ Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
    b Weir did not operate for most of the season. Only observed escapement counts are presented.
    c Weir did not operate.

[^9]:    -continued-

[^10]:    Note: Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates.

[^11]:    Note: Harvest data are from Districts W1 and W2 combined. The commercial coho salmon fishery was executed using restricted mesh ( $\leq 6$ inch) gillnets. Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
    a Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
    b Only age composition and length data were collected.
    c ASL data were not collected.
    d No commercial fishery occurred.

[^12]:    Note: Commercial coho salmon fishery was executed using restricted mesh ( $\leq 6$ inch) gillnets. Data used were derived from the AYKDBMS and do not consider any adjustments for bias or weighting by project daily or annual estimates. Sample size is the number of fish that were successfully aged.
    a Sampling was not appropriate to estimate ASL composition for the season due to insufficient sample sizes collected throughout the entire season or specific temporal strata.
    b ASL data were not collected.
    c Samples were collected, are archived at ADF\&G, but data are not available through the AYKDBMS.
    d No commercial fishery occurred.
