

2026 ANNUAL MANAGEMENT PLAN
Macaulay Salmon Hatchery
Douglas Island Pink & Chum, Inc.

This Annual Management Plan (AMP) is prepared to fulfill the requirements of 5 AAC 40.840. This plan is prepared to guide hatchery operations in accordance with the hatchery permit. The plan must be developed with consideration of the hatchery's production cycle and must organize and guide the hatchery's operations regarding production goals, broodstock management, and harvest management of hatchery-produced salmon. The production cycle begins with adult returns, that lead to egg takes and end with fish releases. Action may be taken outside of the management plan if allowed under the hatchery permit or modified by emergency order. Inseason assessments and project alterations by Douglas Island Pink and Chum (DIPAC) or Alaska Department of Fish and Game (ADF&G or department) may result in changes to this AMP in order to reach or maintain program objectives. DIPAC will notify the ADF&G private nonprofit (PNP) hatchery program coordinator in a timely manner of any departure from the AMP. The ADF&G PNP coordinator will advise as to whether an amendment, exception report, or other action is warranted. No variation or deviation will be implemented until an AMP amendment has been approved or waived by both the department and DIPAC. This policy applies to all hatchery operations covered under the AMP.

1.0 EXECUTIVE SUMMARY

1.1 *Introduction*

In 1987, DIPAC was issued PNP Hatchery Permit #25 to operate Macaulay Salmon Hatchery (MSH) along Gastineau Channel. The current permitted incubation capacity of this facility is 135 million chum, 1.5 million coho, and 1.25 million Chinook salmon green eggs. Salmon enhancement projects operated by the PNP corporation contribute to commercial, sport, and personal use fisheries in Juneau, Haines, Skagway, Petersburg, and Wrangell areas, and along salmon migratory routes in northern Southeast Alaska.

1.2 *New This Year (production, harvest management, culture techniques, etc.)*

No production changes are planned for this year.

Juneau area coho returns are from the 2023 Fish Creek Taku River egg take and with broodstock protection, should allow DIPAC to get back to full production and break the down cycle from the brood year that was affected by the water intake pipe break in 2020. This year's details are below.

The Macaulay Salmon Hatchery received Chinook Mitigation monies to optimize releases of Chinook salmon in the Juneau area. Many of these grants have been used to replace existing equipment, but one grant supported the addition of rearing start tanks for Chinook salmon. These start tanks will assist in allowing Fish Culturists to be able to monitor growth and development, feed, and clean in a more efficient manner for the sake of the best fish health. These tanks will be used for the first time in 2026, and they have taken the place of the round ponds for the catchable program.

1.3 *New permits or permit amendments*

All fish transport permits (FTPs) are current for 2026. FTP 25J-1012 allows the option to return to Fish Creek, in the Taku River drainage, if the return coho to MSH does not satisfy the minimum

2026 Macaulay Hatchery Annual Management Plan

broodstock goal of 300K eggs. This permit is similar to that utilized in 2023 following the return of the affected BY from the 2020 AEL&P pipeline disaster.

1.4 *Expected Returns: 2026 FORECAST*

Species	Return Site/District	Common Property Harvest ¹	Hatchery Terminal Area ²	Total Return
Chum salmon	Gastineau Channel	487,400	439,300	926,700
	Amalga Harbor	412,800	892,700	1,306,000
	Limestone Inlet	171,600	-	171,600
	Boat Harbor	626,200	-	626,200
Chinook salmon	Gastineau Channel	2,200	1,500	3,700
	Auke Bay	360	30	390
	Fish Creek	1,500	500	2,000
	Lena Cove	1,900	500	2,400
Coho salmon	Gastineau Channel	5,200	2,800	8,000

¹Includes commercial catch, marine boat sport harvest, and remote-release site terminal sport harvest.

²Includes cost recovery, broodstock, escapement, and terminal recreational harvest.

1.5 *Planned releases this calendar year*

Program Name	Brood Year	Number to Release	Life Stage	Type of Mark, Percent Marked
Macaulay chum salmon	2025	12,000,000	Fed fry	100% TM
Thane chum salmon (part of Gastineau Channel release)	2025	24,000,000	Fed fry	100% TM
Amalga Harbor chum salmon	2025	48,000,000	Fed fry	100% TM
Boat Harbor chum salmon	2025	24,000,000	Fed fry	100% TM
Limestone Inlet chum salmon	2025	15,000,000	Fed fry	100% TM
Gastineau Channel Chinook salmon ^{1,2}	2024	230,000	Smolt	20% CWT & 100% Adipose clip
Fish Creek Chinook salmon ²	2024	0	Smolt	20% CWT& 100% Adipose clip
Lena Cove Chinook salmon ²	2024	0	Smolt	20% CWT& 100% Adipose clip
Auke Bay Chinook Salmon ²	2024	0	Smolt	20% CWT& 100% Adipose clip
Gastineau Channel coho salmon ¹	2024	1,100,000	Smolt	7% CWT & 7% Adipose clip

¹Includes MSH and Thane Net Pens.

²Collectively, these locations are the Juneau Area release site.

2026 Macaulay Hatchery Annual Management Plan

1.6 *Previous brood years that will remain in culture during the entire calendar year*

Program Name	Brood Year	Number Live (Jan. 1)	Number to Release	Release Date	Life Stage
MSH Chinook	2025	975,800	970,000	Spring 2027	Fry
MSH Coho	2025	885,700	880,000	Spring 2027	Alevin

1.7 *Current Permitting*

Facility	Species	Egg Number
MSH	Chum salmon	135,000,000
	Chinook salmon	1,250,000
	Coho salmon	1,500,000

1.8 *Egg take, Incubation, Rearing, and Release Plans*

Chum Salmon

In 2026, the 135 million chum salmon egg take goal is expected to be met using broodstock returning to MSH. Additional eggs may be available from Northern Southeast Regional Aquaculture Association's (NSRAA) Hidden Falls Hatchery (HFH) for release at Limestone Inlet and/or Boat Harbor. Incubation will occur during the fall and winter of 2026–2027. All chum salmon (100%) will be otolith thermal marked.

Short-term rearing will occur in the spring of 2027 in saltwater net pens at the five approved chum salmon release sites. Each site was selected to meet at least one of three harvest goals: broodstock, cost recovery (CR), or common property (CP) contribution. The following table shows DIPAC's currently approved chum salmon production levels by release site.

Brood year 2026 Chum Salmon Production Levels by Release Site

Release Site	Egg take Goal	Fry Release Goal	Harvest Goals
Macaulay Salmon Hatchery	14,100,000	12,000,000	Broodstock/CP/CR
Thane (Gastineau Channel)	28,200,000	24,000,000	Broodstock/CP/CR
Amalga Harbor	46,900,000	45,000,000	CP/CR
Boat Harbor	28,200,000	24,000,000	CP
Limestone Inlet	17,600,000	15,000,000	CP
Total	135,000,000	120,000,000	

If prioritization of releases between Boat Harbor and Limestone Inlet is necessary, it will be based on input from the drift gillnet fleet and the DIPAC board.

Chinook Salmon

In 1994, the department transferred its Juneau recreational fisheries Chinook salmon enhancement program from Snettisham Hatchery to MSH. The program has been funded through a cooperative agreement between ADF&G Division of Sport Fish and DIPAC. Under the current agreement, general production goals call for DIPAC to produce 250,000 25-gram smolt for release at Fish Creek (N. Douglas), 90,000 smolt at Auke Bay, and 160,000 smolt at MSH.

In recent years, DIPAC reinstituted releasing a portion of Chinook salmon Gastineau Channel production at Thane saltwater site (BY2014) as well as developed a release site at Lena Cove (BY2012). Production at these two sites is funded directly by DIPAC. A short-term cooperative agreement through the Pacific Salmon Treaty's *Southeast Alaska Chinook Fishery Mitigation Program* partially funded these two release sites for two years.

Chinook salmon production for the Juneau program will continue to utilize Andrew Creek stock. In 2026, the up to 1.25 million MSH Chinook salmon egg take goal is expected to be met using broodstock returning to MSH. Crystal Lake Hatchery (CLH), Medvejie Creek Hatchery (MCH), and Gunnuk Creek Hatchery (GCH) may be used as backup egg sources.

Brood year 2026 Chinook Salmon Production Levels, by Release Location

Stock	Release Location	Release Goal
Andrew Creek	Gastineau Channel ^{1,2}	390,000
	Fish Creek ²	250,000
	Auke Bay ²	90,000
	Lena Cove ²	220,000

¹Includes MSH and Thane Net Pens.

²Collectively, these locations are the Juneau Area release site.

In 2026 MSH will mark 100% of its Chinook salmon production with adipose fin clips and a minimum of 20% with coded wire tags (CWT).

Coho Salmon

The 2026 egg take goal will be up to 1.5 million green eggs. Broodstock requirements will be based on inseason fecundity estimates. Smolt will be released in Gastineau Channel at MSH and the Thane saltwater site.

An estimated 7% of the total BY26 coho salmon production will be marked with CWTs.

2.0 HATCHERY RETURN MANAGEMENT

2.1 2026 DIPAC Hatchery Return Projections

Expected 2026 adult salmon returns from DIPAC releases are shown in Table 1 at the end of this plan. Total returns are expected to be 3,030,000 chum, 8,000 coho, and 8,500 Chinook salmon (6,000 large adult Chinook salmon). A complete accounting of CP harvest of adult Chinook and coho salmon will

be obtained from analysis of CWT data. Accounting of CP harvest of chum salmon will be limited to fisheries for which thermal-mark sampling is conducted.

2.2 *Management in CP Fisheries*

DIPAC hatchery returns will contribute to the commercial troll, purse seine, drift gillnet, and sport fisheries along their migration routes back to release sites in the Juneau area. DIPAC Chinook and coho salmon are CWTd to provide estimates of contribution to CP fisheries. Thermal otolith mark and recovery programs have provided contribution estimates for DIPAC chum salmon in the Districts 11 and 15 drift gillnet fisheries, Districts 12 and 14 purse seine fisheries, and in developing troll fisheries in some Districts 12 and 14 spring troll areas.

DIPAC chum salmon returns are harvested in purse seine fisheries in both Icy Strait and northern Chatham Strait. The nearshore waters between Funtler Bay and Point Marsden in Chatham Strait are known as the Hawk Inlet shoreline. Fishing is sometimes allowed in this area to harvest pink salmon migrating northward into Lynn Canal and Upper Stephens Passage. During July, ADF&G manages the Hawk Inlet shoreline in accordance with 5 AAC 33.366, *Northern Southeast Seine Fishery Management Plans*. In 2026, any purse seine fishing opportunities along the Hawk Inlet shoreline in July will be based on observed pink salmon abundance and potential conservation concerns for other salmon stocks. Provided pink salmon abundance surplus to escapement needs is observed during July, purse seine opportunities may occur along the Hawk Inlet shoreline if northbound pink salmon runs are strong. Conversely, if northbound runs are poor during July and southbound runs are strong, purse seining may be allowed only south of Point Marsden. Pink salmon parent-year escapements were within management target ranges for most Juneau management area stock groups, and the joint National Oceanic and Atmospheric Association (NOAA)/ADF&G Southeast Alaska Coastal Monitoring (SECM) survey investigating outbound juvenile salmon abundance had near average results in 2025, anticipating a near average 2026 adult pink salmon return to northern inside waters.

Chum salmon returning to DIPAC facilities are expected to be present in the drift gillnet fisheries in Sections 11-B and 15-C. The District 11 summer drift gillnet fishery is managed on wild stock sockeye salmon abundance. ADF&G may allow additional harvest opportunities in Stephens Passage for chum salmon returning to the Limestone Inlet remote-release site by allowing additional fishing time. A minimum 6-inch mesh size may be required during some weeks from mid-July to mid-August in the area south of Circle Point to protect Port Snettisham wild sockeye salmon stocks transiting the area. This mesh size has been shown to maximize chum salmon harvests while minimizing sockeye salmon interceptions. In 2020, the northern portion of the Point Bishop to Point Arden line in Section 11-B was shifted slightly to the east for three openings (SWs 29-31) to close waters where hatchery fish stage before entering Gastineau Channel in an attempt to preserve DIPAC chum salmon broodstock. Portions of Section 15-C are managed to harvest both wild and hatchery-stock chum salmon runs, and additional fishing time is expected adjacent to Boat Harbor. Fishery sampling for otolith marks provides estimates of the proportions of hatchery-stock chum salmon in the Districts 11 and 15 drift gillnet fisheries to aid wild stock management and assessment of hatchery returns. In 2026, this sampling program is expected to continue.

Chinook and coho salmon returns to DIPAC release sites have contributed substantially to commercial fisheries, as determined by recovery and analysis of CWTs. No specific commercial fishery management actions pertaining to returning hatchery Chinook or coho salmon is deemed necessary

since historical return levels have been sufficient to provide hatchery broodstock. However, MSH coho salmon abundance in the Districts 11 and 15 drift gillnet fisheries are closely monitored in season so wild stock strength can be assessed.

The Juneau area sport fishery also harvests substantial DIPAC hatchery returns. The marine sport fishery harvests significant numbers of Chinook and coho salmon. The Juneau shoreline sport fishery harvests Chinook, coho, and chum salmon near the hatchery release sites. In 1991, a public dock was constructed by DIPAC to provide more sport fishing opportunities. This structure has been replaced by a new dock as part of a highway improvement project that also includes uplands development and continues to be a very popular community fishery. In 2026, DIPAC staff will estimate catch by anglers fishing from the dock and adjacent beach by using a simplified abundance-based model as well as visual observations on the number of sport anglers and catch. Sport fisheries will be managed by general regulations described in codified regulations or by special regulations issued by Emergency Order (EO) for those waters.

2.3 *Special Harvest Areas (SHAs)*

Gastineau Channel SHA

In 1994, the Alaska Board of Fisheries (BOF) combined and expanded the previously existing Kowee Creek, Sheep Creek, and MSH special harvest areas (SHA), located adjacent to each facility, into a common SHA for harvest of CR fish. The revised Gastineau Channel SHA includes all the waters within Gastineau Channel between Salmon Creek and one mile north of the Dupont dock, (all waters east of 134°29.25' W longitude and west of 134°17.38' W longitude) (Figure 3). Legal gear for CR in the Gastineau Channel SHA includes purse seine, hand purse seine, beach seine, fyke net, drift gillnet, set gillnet, and dip net.

Projected returns in 2026 from Gastineau Channel releases are expected to include a total 926,700 chum salmon. The portion of the return not harvested in CP fisheries will be available for CR harvest in the Gastineau Channel SHA and for broodstock. In 2026, a total of 8,000 DIPAC coho salmon are expected to return. Returns to the SHA not harvested in CP fisheries will be available for CR and broodstock. Tables 6–13 summarize pink, chum, coho, and Chinook salmon returns by SHA.

DIPAC will operate a weir in Salmon Creek to control the number of hatchery-stock chum salmon entering the stream. Beginning around July 1, DIPAC will monitor abundance of chum salmon in Salmon Creek. When enough chum salmon are present, the weir will be installed and operated to control escapement of chum salmon into the stream throughout the run. Salmon Creek will be managed for a maximum escapement of 2,500 chum salmon. Appropriate measures will be taken to ensure the weir does not cause substantial delay or mortality in the migration of other salmon and trout species; these measures may include, but are not limited to, opening pickets to pass fish holding below the weir and removing the weir when ADF&G considers chum salmon escapement control measures are no longer necessary. Sport fisheries will be managed as described in codified regulations for these waters. The department may use EO authority to address issues in season. The department typically liberalizes sport harvest limits for Chinook salmon in a terminal area that includes a portion of the Gastineau Channel SHA. In 2026, the liberalized Chinook sport fishing regulations will include a larger area that will overlap the entire Gastineau Channel SHA and expand

west and south of the SHA boundaries. This action is done by Emergency Order (1-KS-E-12-26) issued on April 22, 2026. In recent years the department has issued an EO to close snagging and king salmon fishing near the dock and fish ladder. This action typically takes effect beginning July 1 and is designed to protect king salmon that are needed for broodstock. In this area king salmon are susceptible to harvest as the mill about prior to making it up the fish ladder making this closure necessary.

In addition, the forecast for hatchery coho is very poor for 2026 and it is likely that a larger coho closure area will be necessary to improve numbers for broodstock. This emergency closure would likely include a large portion of Gastineau Channel and would be in effect September 1 through October 15.

Amalga Harbor SHA

In 1997, the BOF adopted a proposal designating the Amalga Harbor SHA into regulation. The Amalga Harbor SHA has been opened by EO annually since 1994. This SHA includes those waters enclosed by a line from the Shrine of St. Therese to the southernmost tip of Bird Island to the northernmost tip of Gull Island to a point on the eastern mainland shore at the latitude of 58°30.80' N (Figure 4). As stated in the MSH permit, if conflicts with wild stocks become evident during the hatchery CR fishery, restrictions in the harvest area may be necessary or alternative sites may be investigated. DIPAC chum salmon CR primarily takes place in the Amalga Harbor SHA; however, in years of large returns to MSH, CR may take place in the Gastineau Channel SHA.

Fed chum salmon fry were released from the Amalga Harbor site for the first time in 1991 and the first substantial returns occurred in 1994. In 2026, projected returns from Amalga Harbor fry releases are expected to total approximately 1,305,500 chum salmon. To increase the CP share of enhanced chum salmon production, DIPAC will be continuing with CP purse seine openings in a portion of the Amalga Harbor THA, if conditions warrant. This is a step towards the DIPAC goal of providing at least 60% of production to CP harvest. Purse seine gear is the only net gear type that can legally fish in Section 11-A and is very effective in harvesting a substantial volume of fish in a short period of time, thereby minimizing impact to the Amalga Harbor area. These openings may occur during a 9-hour period (9:00 a.m. – 6:00 p.m.) on Thursdays in July. Decisions about these commercial openings will be based on returning run strength of hatchery-stock chum salmon, progress towards CR goals, expected effort levels, and considerations for nontarget species. The department will sample the harvest for sockeye salmon otoliths as part of the normal sampling of commercial salmon harvests.

DIPAC will operate a weir at the outlet of the Petersen Creek lagoon to control the number of hatchery-stock chum salmon entering Peterson Creek. Peterson Creek will be managed for a maximum escapement of 3,000 chum salmon. Appropriate measures will be taken to ensure the weir does not cause substantial delay or mortality in the migration of other salmon and trout species; these measures may include, but are not limited to, opening pickets to pass fish holding above or below the weir and removing the weir when ADF&G considers chum salmon escapement control measures are no longer necessary. ADF&G will require DIPAC to conduct CR fishing in the Amalga Harbor SHA to remove salmon should a substantial number remain after fisheries have ceased. Sport fisheries will be managed as described in codified regulations for these waters. The department may use EO authority to address

issues in season. In 2026, a portion of the Amalga Harbor SHA will again be closed to sport fishing as was done in 2019–2025 due to low steelhead returns to Peterson Creek. The sport fishing closure occurs from the barrier falls on Peterson Creek to the saltwater shoreline within 200 yards of the creek mouth from April 15 through June 30. Due to low coho salmon escapements to Peterson Creek during 4 of the last 7 years (2019–2025), additional sport fishing closures for coho salmon were implemented from 2022–2025 and will also be implemented in 2026 where fishing for coho salmon is closed September 1 through December 31.

Boat Harbor SHA

In 1996, the Regional Planning Team (RPT) requested establishment of an SHA near the Boat Harbor remote-release site that could be opened by EO. In 1997, the BOF adopted a proposal designating an SHA near the Boat Harbor remote-release site into regulation. The Boat Harbor SHA is described as those waters within one mile of the western shoreline of Lynn Canal south of 58°40' N latitude to a point 2.4 miles north of Pt. Whidbey at 58°37.05' N latitude, including the waters inside Boat Harbor (Figure 2). In 2026, the return from Boat Harbor releases is expected to total 626,200 chum salmon. DIPAC does not anticipate using the SHA for CR this year. ADF&G will require DIPAC to conduct CR fishing in the SHA to remove salmon should a substantial number remain after fisheries have ceased. Sport fisheries will be managed as described in codified regulations for these waters. The department may use EO authority to address issues in season.

Limestone Inlet SHA

In 1996, the RPT requested establishment of an SHA near the Limestone Inlet remote-release site that could be opened by EO. The SHA was designated in the MSH PNP Permit in 1996. The area is described as those waters of Limestone Inlet east of a line from 58°01.75' N latitude, 133°59.40' W longitude to 58°02.04' N latitude, 133°59.60' W longitude (Figure 1). This area is closed to commercial fishing by regulation, although outer portions of the inlet are opened to commercial fishing by EO to increase utilization of returning hatchery-stock chum salmon. This management strategy will be followed again in 2026. CR fishing within this SHA was experimental in nature in 1996 and 1997. No CR fishing has been conducted at Limestone Inlet since 1997 and DIPAC does not anticipate using the SHA for CR this year. The 2026 return from Limestone Inlet releases is expected to total approximately 171,600 chum salmon. ADF&G will require DIPAC to conduct CR fishing in the SHA to remove salmon should a substantial number remain after fisheries have ceased. Sport fisheries will be managed as described in codified regulations for these waters. The department may use EO authority to address issues in season.

2.4 *Carcass Disposal Plans*

Broodstock

As in previous years, broodstock carcasses will be sold or disposed of in a manner consistent with Alaska Department of Environmental Conservation wastewater discharge regulations.

Cost Recovery

As in prior years, DIPAC intends to fully utilize all CR fish harvested in its SHAs. ADF&G will require DIPAC to conduct CR fishing in the SHAs to remove salmon should a substantial number remain after fisheries have ceased.

3.0 SPECIAL STUDIES

1. DIPAC conducts contract work for the National Marine Fisheries Service at the NOAA Fisheries Auke Bay Laboratory in association with the Southeast Coastal Monitoring (SECM) project.
2. DIPAC is collaborating with NOAA's Auke Bay Labs to assess thiamine levels and associated life stage survival in Andrew Creek stock Chinook salmon. 100,000 eggs from DIPAC's BY25 Chinook have been tested for and classified as "replete" or "deficient" in thiamine (50,000 fish per group). Unique CWT codes will be applied to each group, and these fish will be 100% clipped and tagged. They are to be reared in separate but equal freshwater conditions during 2026 and released from the Auke Bay net pen site in the spring of 2027. Minimal modifications to DIPAC's standard rearing procedures were needed to accommodate this study, and no changes to smolt production are expected.

4.0 APPROVAL

Recommendation for Approval

Katie Harms, Executive Director 5/28/2026

Scott Forbes, Area Management Biologist, Division of Commercial Fisheries 6/11/2026

Dan Teske, Area Management Biologist, Division of Sport Fish 5/29/2026

Anne ReynoldsManney, Regional Supervisor, Division of Commercial Fisheries 5/18/2026

Judy Lum, Regional Supervisor, Division of Sport Fish 6/18/2026

Lorna Wilson, PNP Program Coordinator, Div. of Commercial Fisheries 6/18/2026

Approval:

The 2026 Macaulay Salmon Hatchery Annual Management Plan is hereby approved:

Jason Dye, Deputy Director, Division of Sport Fish 6/22/2026

Forrest Bowers, Acting Director, Division of Commercial Fisheries 6/29/2026

Total	12,409,000	1,325,000	17,373,000	1,547,000	32,800	-	541,700	71,900

1/ Shaded cells represent Snettisham Hatchery fish released at Sheep Creek as part of a cooperative agreement between DIPAC and ADF&G.

2/ Releases from "other" areas were made at:

1986 brood released from Auke Rec in 1988.

1988 brood released as pre-smolt into Mendenhall Ponds in December 1989.

1991 brood released as pre-smolt into Picnic Creek at Lena Cove in September 1992.

1992 brood includes 48,574 pre-smolt (10,130 tagged) released into Davidson Creek and 2,000 pre-smolt (untagged).

3/ Includes 9,874 Pavlof River coho F/W reared at Auke Creek Hatchery and transferred to Sheep Creek Hatchery for S/W rearing and release. (All fish were coded wire tagged.)

4/ Includes 7,229 Pavlof River coho F/W reared at Auke Creek Hatchery and transferred to Sheep Creek Hatchery for S/W rearing and release. (All fish were coded wire tagged.)

5/ Sheep Creek releases from UAF coho outbreeding project.

8/ Early released 466,200 due to loss of water supply (few fish are expected to survive).

The remaining 293,400 were released as normal in May.

9/ Released as 1 gram fed fry as a cooperative venture w/ the USFS

1/ Dark shaded cells represent Snettisham Hatchery fish released at Sheep Creek and Macaulay Hatchery as part of cooperative agreements for sport fishery enhancement and brood stock development, respectively.

2/ Light shaded cells represent releases of King Salmon River stock chinook. All other production releases are Andrew Creek stock.

3/ Numbers in bold are actually age 2.0 BY88 fish released at Sheep Creek in 1991.

4/ Brood year 1987 and 1988 fish are DIPAC fish produced at Snettisham for DIPAC brood stock development.

5/ Twin Lakes BY 1991 fish were released as age 3.0 fish in November 1994.

Twin Lakes BY 1992 fish were released as age 2.0 fish in May 1995.

6/ "Other" BY 1991 releases include 62,579 (60,555 tagged) Tahini River fish and 44,820 (43,018 tagged) Big Boulder Creek fish, released into their respective streams on May 1992.

"Other" BY 1992 fish were released into Big Boulder Creek in May 1993.

"Other" BY 1993 fish were released into Big Boulder Creek in May 1994.

"Other" BY 2008 fish were released (500 each) into Glacier L. (right pelvic fin clip), Moraine L. (left pelvic fin clip), and Crystal L. (upper caudal fin clip) in October 2010.

"Other" BY 2009 fish were released into Glacier L., Moraine L., and Crystal L. in May 2012.

7/ Auke Creek release represented by Fish Creek tags.

8/ Released prior to osmocompetence/smoltification due to loss of water supply.

1/ Although all broodstock return to Macaulay Hatchery, a portion is allocated to each release site in proportion to common property catches estimated from CWT recoveries.

2/ Returns do not include jacks.

3/ The release of BY97 coho from Sheep Creek Hatchery in 1999 was conducted under contract with the University of Alaska, Southeast for a genetics outbreeding depression experiment. Egg sources for this release include: Macaulay Hatchery, Hidden Falls Hatchery and Whitman Lake Hatchery.
