SEALS

SURVEY-INVENTORY PROGRESS REPORT-1976

G.M.U.'s 18, 22, 23 and 26 - Western and Arctic Alaska Seasons and Bag Limits

Closed; except Alaskan natives, which under provision of the Marine Mammal Protection Act, can take seals with no limit.

Harvest and Hunting Pressure

For the past four years, annual harvest figures for these game management units were derived from samples obtained from selected villages within the area. In 1976, Hooper Bay, Gambell, Savoonga and Shishmaref were used as sample villages (Appendix I). Local residents were hired to record numbers of seals by species and reported a combined harvest of 1357 seals. (Table 1). This harvest was comprised of 57 percent ringed seals, 25 percent bearded seals, 18 percent spotted seals and only a few ribbon seals. Based upon periodic surveys by Department personnel, it was estimated that reported harvests were, on the average, 10 percent low. From this information, the harvest for these sample villages was revised up to 1492. Past data indicate the sample village harvest represents approximately 25 to 30 percent of the total seal harvest in these game management units. The total annual harvest is therefore estimated at 4973 to 5968 seals. Using the observed species composition from the sample villages, 2835 to 3402 ringed seals, 1293 to 1492 bearded seals and 895

to 1074 spotted seals are estimated to have been taken. In the overall harvest, ribbon seals are estimated to be approximately one dozen animals.

Hunting pressure as reflected by harvest levels, appears to have declined from what it was during the early years of statehood. In the early 60's, bounties and the lack of alternate food sources provided incentives to local hunters to effect a large annual harvest, sometimes approaching 30,000 animals. Much of the present harvest pressure is a result of two factors: 1) the use of seal skins in clothing and novelty items for sale and 2) the urge to continue traditional activities even though much of the actual need is gone.

Composition and Productivity

As might be suspected, the bulk of the harvest (57%) was comprised of ringed seals. A harvest of this magnitude does not accurately reflect the population status of this species in relation to the abundance of bearded and spotted seals. Recent surveys indicate that the ringed seal population may exceed one million animals while bearded seal numbers are approximately 300,000 and spotted seal numbers are about 200,000. Ribbon seal numbers are estimated at aboug 100,000 individuals. Seasonal distribution of each species and timing of hunting effort account for biases within the harvest.

Sex ratios were found to be equal in the ringed seal and spotted seal harvests. However, the sample was weighted toward females within the bearded seal harvest. Hunter selection is not a factor and any variability in the sex ratio of the total harvest is a function of distribution patterns and behavioral differences between the sexes.

Productivity is difficult to assess, however, specimen material is annually collected by the Department and analysis should provide some insight into this aspect of the seal population.

Management Summary and Recommendations

At present harvest levels, the three seal species, ringed, bearded, and spotted, are in no immediate danger of over harvest. If additional incentives arise, such as the allowance of the sale of raw skins, a rapid increase in the seal harvest could result.

If management of seals is returned to the State, non-native and native hunting will be recommended. Additionally, assuming present harvest levels remain constant, a no closed season is also suggested. During the 1950's and 60's annual harvests averaged 15,000 seals per year. As can be seen from present harvest levels, there is no justification for any retrictions of the harvest. Utilization standards could be improved in some areas wehre large numbers of seals are taken for the procurring of skins used in the manufacture of items for sale.

RETRIEVED KILL OF WALRUS IN ALASKA FROM 1967 THE, UGH 1976 BY AREA

No walrus taken at N.E. Cape after 1969. Harvest data for Nome substituted after 1969. To be divided among Teller, Brevig Mission, Kotzebue, Kivalina, Pt.Lay, Kaktovik and Nuigsut

MEMORANDUM

State of Alaska

To: John Burns
Marine Mammal Coordinator
Division of Game
Fairbanks

DATE: 15 February 1977

FILE NO:

TELEPHONE NO:

Game Biologist
Nome

SUBJECT: Marine mammal harvest of 1976

The marine mammal harvest as outlined in the attached tables is as complete as our present sources allow. The harvest of northern villages beyond Pt.Hope are not well known by myself and you may have additional data to add for that area.

Four tommunities, Hooper Bay, Gambell, Savoonga and Shishmaref had relatively complete seal harvest data for 1976 and can provide some insight to harvest composition by species and sex. Past records indicate that these four villages have traditionally taken 20 percent of the seal harvest in this region. Based on a harvest of 1337 seals in these four communities, the projected harvest is estimated to be 6685 seals from the Kuskokwim region north to the Canadian border. Species composition from this sample was 54 percent ringed seals, 25 percent bearded seals and 20 percent spotted seals and less than 1 percent ribbon seals.

The walrus figures are the same as those discussed over the phone. Polar bear harvest is based on sealing slips issued from our office and do not include animals taken north of Pt.Hope. Whale harvest including belugas is somewhat incomplete except for St.Lawrence Island, Pt. Hope, Wainwright and Barrow, and therefore the figures represent a very minimum harvest.

Utilization of retrieved kill is a complex situation reflecting seasonal variations in animal abundance, hunting conditions, availability of alternate food sources and hunter attitudes. Generally utilization of marine mammals, specifically seals, has been 80 percent of better in much of the Yukon-Kuskokwim Delta area. Animals are hunted throughout the year but are never available in large numbers thus predisposing the taker to use all that he can salvage. In northern areas in the vicinity of the Bering Strait, hunting effort and prey availability appear to be more seasonal. A feast and famine situation exists in several of the communities. In villages like Shishmaref, utilization of retrieved kill may be 50 percent or even less. When seals, walrus or whales are available they are taken in large numbers even though capabilities to process and preserve substantial portions of the useable food are limited. In light of the harvest of6685 seals, 2989 walrus, 39 whales, 200 belugas and 79 polar bears, the total quantity of edible products is substantial and consequently the amount of loss from spoilage is also substantial probably exceeding 1/2 million pounds. Again the harvest figures do not include all villages that take marine mammals nor necessarily the entire harvest at these villages listed. Conclusions derived from the harvest data should be considered minimum.
