January 2019

The Fishery Management Reports series was established in 1989 by the Division of Sport Fish for the publication of an overview of management activities and goals in a specific geographic area, and became a joint divisional series in 2004 with the Division of Commercial Fisheries. Fishery Management Reports are intended for fishery and other technical professionals, as well as lay persons. Fishery Management Reports are available through the Alaska State Library and on the Internet: http://www.adfg.alaska.gov/sf/publications/. This publication has undergone regional peer review.

#### Abstract

This report is a summary of the 2018 season and historical data concerning management of the commercial salmon fisheries of the Northwestern and Northern districts of the North Alaska Peninsula in the Alaska Peninsula Management Area (Area M). Most commercial salmon fishing effort on the North Alaska Peninsula targeted sockeye salmon Oncorhynchus nerka. The 2018 commercial salmon harvest on the North Alaska Peninsula was 1,761 Chinook O. tshawytscha, 2,366,324 sockeye O. nerka, 105,210 coho O. kisutch, 32,241 pink O. gorbuscha, and 157,349 chum $O$. keta salmon. The North Alaska Peninsula Chinook salmon harvest was below the 10-year average of 2,025 fish. The sockeye salmon harvest in the Northern District of 2,350,646 fish was above the 10-year average harvest of $1,998,486$ fish. Of the Northern District harvest, $93 \%$ ( $2,182,607$ fish) were harvested in the sections between Port Moller and Outer Port Heiden. The North Alaska Peninsula chum salmon harvest of 157,349 fish was below the 10-year average of 174,182 fish, with about $67 \%$ ( 105,705 fish) of the harvest occurring in the Northwestern District, specifically in the Izembek-Moffet Bay Section. Nearly all Northern District chum salmon harvest was incidental to targeted sockeye salmon fisheries. The total exvessel value of all North Peninsula fisheries is estimated to be 16.5 million dollars. The majority of the value of the North Peninsula fisheries is made up of sockeye salmon harvested in the Northern District (15.8 million dollars).

Total sockeye salmon escapement for North Alaska Peninsula streams was $1,328,750$ fish, slightly above the 10year average of $1,187,390$ fish. Approximately $67 \%$ of the sockeye salmon escapement occurred in the Northern District's four systems in which sockeye salmon escapements are enumerated with weirs (Nelson, Bear, Sandy, and Ilnik rivers).

Key words: North Alaska Peninsula, Area M, Northern District, Northwestern District, commercial fisheries, annual management report, AMR, salmon harvest, salmon escapement, SEG, BEG, Chinook salmon, Oncorhynchus tshawytscha, sockeye salmon, Oncorhynchus nerka, coho salmon, Oncorhynchus kisutch, pink salmon, Oncorhynchus gorbuscha, chum salmon, Oncorhynchus keta

## INTRODUCTION

The purpose of this report is to document catch and escapement data, and to provide commercial salmon fishermen, buyers, and interested parties a context with which to compare the 2018 North Alaska Peninsula commercial salmon catch and escapement with historical information. Subsistence harvests and fish kept for personal use (home pack) are not included in this report, information regarding the 2017 subsistence and personal use harvests are instead reported for the entirety of area M in the 2018 South Alaska Peninsula Salmon Annual Management Report (Fox et al. 2019). Reporting of subsistence harvest lags one year behind reporting of commercial harvests because subsistence permits are often not returned by users until well into spring of the next year. The salmon harvest estimates reported in this document were summarized from the fish ticket database on October 20, 2018. Unless otherwise noted, catch reporting in this document does not include personal use, subsistence, or test fish catches. Data published in this report supersede any data previously published.

## GEOGRAPHY

## North Alaska Peninsula

The North Alaska Peninsula portion of the Alaska Peninsula Management Area (Area M) includes those waters of the Alaska Peninsula from Cape Sarichef to Cape Menshikof and consists of two districts: the Northwestern District, which includes all waters between Cape Sarichef and Moffet Point, and the Northern District, which includes all waters between Moffet Point and Cape Menshikof (Figure 1). The Nelson Lagoon to Outer Port Heiden region, which encompasses most of the Northern District, is the primary sockeye salmon harvest area on the North Alaska Peninsula and includes the Nelson Lagoon, Bear River, Three Hills, Ilnik, and

Outer Port Heiden sections (Figure 2). In addition to these sections, smaller directed commercial salmon fisheries occur in other areas of the North Alaska Peninsula.

## Alaska Peninsula and Bristol Bay Salmon Overlap Area

The Alaska Peninsula Area (Area M) and Bristol Bay Area (Area T) overlap; the overlap area consists of the Cinder River Section, Inner Port Heiden Section, and Ilnik Lagoon (Figure 3; 5 AAC $39.120(\mathrm{~d}))^{1}$. The overlap area was created shortly after statehood to allow Area T permit holders the opportunity to fish within their traditional harvest locations of Area M. Historically, when not participating in the Bristol Bay sockeye salmon Oncorhynchus nerka fisheries, Port Heiden Area T permit holders fished for Chinook O. tshawytscha and coho O. kisutch salmon in the Inner Port Heiden Section, and Area T permit holders from Pilot Point fished inside the Cinder River Section for Chinook and coho salmon.

Since 1985, when effort has occurred, most effort in the Cinder River Section has been from Area $T$ permit holders. In recent years a small amount of harvest effort has occurred from Area M permit holders. Prior to 2013 Area T permit holders were allowed to fish during the open season in the Inner Port Heiden and Cinder River sections, except during the month of July. In 2013 the Alaska Board of Fisheries (board) allowed Area T permit holders to fish in the Inner Port Heiden Section and the inner portion of the Cinder River Section during all months of the commercial fishing season. Area T permit holders are also allowed to fish in Ilnik Lagoon during August and September. In 1986, Area T fishermen started fishing in the Ilnik and Outer Port Heiden sections. In 1990, the board excluded Area T permit holders from the Ilnik Section (except inside Ilnik Lagoon during August and September) and closed the Outer Port Heiden Section in August and September to all commercial salmon fishing by both Area M and Area T permit holders, because of concern over potential interception of coho salmon bound for Inner Port Heiden (Meshik River). Since the turn of the century commercial salmon fishing effort in the overlap area has been minimal for both Area M and Area T permit holders.

## GEAR

Purse seine, hand purse seine, drift gillnet, and set gillnet are legal gear types in the Northwestern District (5 AAC 09.330(b)). In the Northern District, commercial salmon fishing is permitted with purse seine, drift gillnet, and set gillnet gear; however, within-section gear restrictions exist. For example, the Nelson Lagoon Section is open to drift and set gillnet gear only. In the Northern District drift gillnet is by far the most widely used gear. In the Northwestern District, use of purse seine gear equals or exceeds drift gillnet gear in some years.

## REGULATORY SEASON

The commercial salmon season opens in most of the Northwestern District on June 1 and in most of the Northern District on May 1 (5 AAC 09.310). The Three Hills Section may open to commercial salmon fishing on June 25. In the Ilnik Section fishing may be allowed as soon as June 20 if sockeye salmon escapement at the Ilnik River warrants it, except that in Ilnik Lagoon harvest may be allowed as early as May 1. A portion of the Outer Port Heiden Section may open to commercial salmon fishing beginning on June 20 if the sockeye salmon escapement in the Meshik River warrants it. Management action may also be taken in the Ilnik and Outer Port

[^0]Heiden sections for conservation of Ugashik River sockeye salmon, if that portion of the Egegik District specified in 5 AAC 06.359(c) is closed for the conservation of Ugashik River sockeye salmon in the Bristol Bay Management Area.

## Inseason Management

Although the earliest opening dates are established by regulation and modified by emergency orders, actual fishing time in North Alaska Peninsula salmon fisheries is based on inseason evaluation of local stock abundance and escapement objectives. Sockeye salmon are the primary species targeted for harvest, and Nelson and Bear rivers are the largest sockeye salmon producing systems. Between June 1 and September 15, within the Nelson Lagoon to Port Heiden region, management emphasis is on five sockeye salmon systems: Nelson, Bear, Sandy, Ilnik, and Meshik rivers (Murphy and Johnson 2018). Alaska Department of Fish and Game (ADF\&G) operates weir camps on the Nelson, Bear, Sandy, and Ilnik rivers that provide daily escapement counts used to manage commercial salmon fisheries. Aerial surveys from a fixed-wing aircraft are used to enumerate salmon in other systems that do not have weirs.

ADF\&G manages the commercial salmon fisheries in the Northern District based on the inseason evaluation of local stock abundance and escapement objectives. In 2013, regulations applying rolling closures were implemented for the conservation of sockeye salmon stocks in the Bear and Nelson rivers. Rolling closures are in effect from June 20 through July 31 in the Bear, Three Hills, and Ilnik sections to allow passage of sockeye salmon from the northeast to the southwest of the Northern District. For management purposes, the three sections are separated into five areas: South Bear, North Bear, Three Hills, SW Ilnik and NE Ilnik (Figure 4). At the February 2016 board meeting, the board modified regulations in the Northern District so that only four of the five areas now undergo rolling closures; the portion of the Ilnik Section northeast of Unangashak Bluffs (NE Ilnik) is now excluded from rolling closures (5 AAC 09.369 (n)). The waters in the most northeastern of the four areas, between the 3 nmi seaward boundary line described in 5 AAC 09.301 and a line that is 1.5 nmi shoreward of the 3 nmi seaward boundary, are closed for one 24 -hour period during a seven-day period. After the 24 -hour period, the rolling closure will move on to the next area to the southwest, allowing fishing in the waters only out to the 1.5 nmi line described in this subsection. The rolling closure continues down the coast until all four areas have had one 24 -hour period of closure during a seven-day period. The rolling closure regulations are scheduled to sunset after December 31, 2018.

At the February 2016 board meeting the Outer Port Heiden Section commercial fishing area was reopened out to the 3 nmi baseline, as opposed to the 1.5 nmi line that was in effect from 2013 through 2015 for the conservation of Bristol Bay sockeye salmon (5 AAC 09.350 (3)(A)).

## EsCAPEMENT Goals

Weir counts and aerial surveys are used to estimate escapement (5 AAC 39.222) ${ }^{2}$. For rivers and river systems with established escapement goals, there are two types of goals used to characterize the run. A biological escapement goal (BEG) is used when the following conditions are met: 1) a sufficient time series of escapement and total return estimates are available, 2) contrast in the escapement data is sufficiently large, and 3) the estimates were sufficiently

[^1]accurate and precise (Schaberg et al. 2015). Using these criteria, systems assigned a BEG are managed for escapements providing the greatest potential for maximum sustained yield. A sustainable escapement goal (SEG), on the other hand, is used when total return estimates are not available because stock specific harvest or age was not consistently measured (Schaberg et al. 2015). Methods used to develop SEGs include the percentile approach and risk analysis models (Schaberg et al. 2015). As defined by the Sustainable Salmon Fisheries Policy (SSFP; 5 AAC 39.222), a SEG is a level of escapement indicated by an index or escapement estimate that is known to provide for sustained yield over a five to ten year period and is used in situations where a BEG cannot be estimated or managed for, due to the absence of a stock specific catch estimate.

The commercial salmon fisheries on the North Alaska Peninsula are managed using escapement goals developed using BEG or SEG criteria and methods. The inseason escapement at each system with an established goal determines how the fisheries are managed.

## Run Timing

The timing of sockeye salmon returning to North Alaska Peninsula streams varies by system and stock, but the majority of the sockeye salmon runs occur from early June to late July. Local sockeye salmon stocks are managed from the northern side of Unimak Island to the Cinder River region from June through September. The Nelson River sockeye salmon run begins in early June, peaks in early July, and is over by mid-August (Murphy and Hartill 2009). Bear River supports two distinct sockeye salmon runs: an early run that begins in early June, peaks in early July, and ends in late July; and a late run that starts in late July, peaks in mid-August, and ends in September (Ramstad 1998). The Sandy, Ilnik, Meshik and Cinder rivers run timing closely parallels the Bear River early run, beginning in early June and ending in late July (Murphy and Hartill 2009).

## HARVEST BY SPECIES

## CHINOOK SALMON

The 2018 North Alaska Peninsula commercial Chinook salmon harvest of 1,761 fish was slightly lower than the 10 -year average of 2,025 fish (Table 1). Historically, the vast majority of Chinook salmon harvest that occurred in the Northern District was incidental to sockeye salmon fisheries, although periodically there have been directed fisheries. In 2018, the Chinook salmon harvest of 902 fish in the Nelson Lagoon Section was above the 10-year average of 652 fish (Tables 2 and 3). The Bear River Section harvest of 33 Chinook salmon occurred incidentally to the sockeye salmon fisheries and was below the 10-year average of 447 fish (Table 3). The Three Hills and Ilnik sections combined harvest of 274 Chinook salmon was below the 10-year average of 533 fish (Table 3). The Outer Port Heiden Section had a harvest of 441 Chinook salmon (Table 2), which was above the 10-year average of 342 fish (Table 3). There was no commercial fishing effort in the Inner Port Heiden Section in 2018.

## SOCKEYE SALMON

The 2018 North Alaska Peninsula sockeye salmon harvest of 2,366,324 fish (Table 1) was slightly above the 10 -year average harvest of $2,112,571$ fish as well as the 1998-2017 average harvest of 2,066,989 fish (Figure 5). The 2018 harvest was below the preseason projected harvest of $2,800,000$ sockeye salmon (Table 1; Murphy and Johnson 2018). The 2018 peak weekly
harvest for sockeye salmon on the North Alaska Peninsula occurred from July 12 to July 18, when 160 permit holders caught 635,574 sockeye salmon (Table 2).

Most of the harvest occurred in the Northern District in the Nelson Lagoon, Bear River, Three Hills, Ilnik and Outer Port Heiden sections (Figures 1 and 2). The Nelson Lagoon sockeye salmon harvest in 2018 was 165,303 fish, which was below the 10-year average harvest of 207,327 fish (Table 4). The Nelson Lagoon harvest made up approximately 7\% of the total North Alaska Peninsula sockeye salmon harvest. The combined Port Moller Bight, Bear River, Three Hills, and Ilnik sections total harvest was $1,831,176$ sockeye salmon (Table 5) and the Outer Port Heiden Section had a harvest of 356,014 fish (Table 4). The combined Port Moller Bight, Bear River, Three Hills, Ilnik and Outer Port Heiden sections accounted for approximately 93\% (2,191,104 fish; Table 2) of the North Alaska Peninsula sockeye salmon harvest. Of that harvest, the Ilnik Section had 49\% (1,067,597 fish), the Outer Port Heiden Section accounted for about $16 \%$ ( 356,014 fish), the Bear River Section had approximately 18\% (397,206 fish), and the Three Hills Section had 17\% (361,790 fish; Table 4). The percentage of harvest in the Bear River Section in 2018 was below the most recent 10-year average (23\%). The percentage of commercial catch in the Three Hills Section was above the most recent 10-year average (5\%). The percentage of commercial catch in the Ilnik Section was comparable to the most recent 10 -year average of $44 \%$. The percentage of harvest caught in the Outer Port Heiden Section was below the 10-year average of $35 \%$ (Figure 6).

## COHO SALMON

The 2018 North Alaska Peninsula coho salmon harvest of 105,210 fish was well above the 10year average harvest of 57,940 fish (Table 1). Approximately $31 \%$ ( 33,134 fish) of the coho salmon harvest came from the Ilnik Section, and 30\% of the harvest ( 31,058 fish) came from the Nelson Lagoon Section (Table 6). The remaining Northern District sections had approximately $30 \%$ of the coho salmon harvest (31,335 fish). The Northwestern District accounted for $9 \%$ of the harvest ( 9,683 fish, Table 6). The Nelson Lagoon Section typically has the largest coho salmon harvest, followed by either the Bear River or Ilnik sections; however, this year the Ilnik Section coho salmon harvest, incidental to the sockeye salmon harvest, made up the major part of the total harvest.

## PINK SALMON

The 2018 North Alaska Peninsula pink O. gorbuscha salmon harvest of 32,241 fish was above the 2008-2017 even-year average harvest of 10,771 fish (Table 1). Pink salmon harvested in the Northern District are caught incidental to fisheries for other salmon species. The majority of the pink salmon harvest traditionally occurs in the Northwestern District; however, in 2018 the Northern District accounted for the majority of the commercial harvest, with the Northwestern District accounting for only $8 \%$ (2,509 fish) of the pink salmon harvest (Table 7). All of the pink salmon harvested in the Northwestern District during 2018 were incidental to chum O. keta and sockeye salmon harvests which occurred in the Izembek-Moffet Bay Section.

## CHUM SALMON

The 2018 North Alaska Peninsula chum salmon harvest of 157,349 fish was below the 10-year average harvest of 174,182 fish (Table 1). In the Northern District, the harvest of 51,644 fish was comparable to the 10 -year average of 56,307 fish (Table 8). The majority of the chum salmon harvest in the Northern District occurred in the Ilnik Section (15,886 fish; Table 2). The

Northwestern District chum salmon harvest of 105,705 fish was below the 10-year average of 117,874 fish. All Northwestern District chum salmon harvested during the 2018 season were harvested in the Izembek-Moffet Bay Section, and the harvest for that section was above the 10-year average harvest of 99,580 fish (Table 9).

## ESCAPEMENT BY SPECIES

## Chinook Salmon

The 2018 North Alaska Peninsula estimated total Chinook salmon escapement of 15,909 fish was above the 10 -year average of 12,667 fish (Table 1). During the 2018 season, 5,022 Chinook salmon passed the Nelson River weir (Table 10; Appendix A1). The 2018 Nelson River Chinook salmon escapement of 5,022 fish exceeded the BEG range of 2,400-4,400 fish (Schaberg et al. 2015). Nelson River is the only river on the North Alaska Peninsula with a Chinook salmon escapement goal. The combined King Salmon, Bear, and Sandy rivers (Bear River Section) estimated Chinook salmon escapement was 1,872 fish, which was comparable to the 10 -year average of 1,568 fish (Table 3; Appendix A1). The Bear River and Sandy River weir counts (Tables 11 and 12) do not accurately reflect the total escapement of Chinook salmon because most of the fish spawn below the weir sites or in downstream tributaries. There were 15 Chinook salmon that passed the Ilnik River weir in 2018 (Table 13). The Chinook salmon escapement of 2,650 fish into the Inner Port Heiden Section (the Meshik River and its tributaries) was below the 10 -year average of 2,943 fish (Table 3; Appendix A1). In the Cinder River Section, 5,200 Chinook salmon were documented, which was well above the 10-year average of 3,297 fish (Table 3; Appendix A1).

## Sockeye Salmon

The 2018 North Alaska Peninsula estimated total sockeye salmon escapement of 1,328,750 fish, which included weir and aerial survey counts, was above the 10 -year average estimated escapement of 1,187,390 fish (Table 1; Figure 7). The combined North Alaska Peninsula escapement goal range is 583,400-1,095,800 sockeye salmon for systems with established goals (Schaberg et al. 2015). The systems with an SEG are Christianson Lagoon (25,000-50,000 fish), Swanson Lagoon (6,000-16,000 fish), North Creek (4,400-8,800 fish), Bear River (early run 176,000-293,000 fish, late run 117,000-195,00 fish, or combined 293,000-488,000 fish), Sandy River (34,000-74,000 fish), Ilnik River (40,000-60,000 fish), Meshik River (48,000-86,000 fish), and Cinder River (36,000-94,000 fish; Schaberg et al. 2015). Nelson River is the only system on the North Alaska Peninsula with a BEG (97,000-219,000 fish; Schaberg et al. 2015). The systems most often considered in management decisions and the historical escapements and goal ranges are detailed in Table 14. In 2018 five systems exceeded their escapement goals; Bear River (557,000 sockeye salmon), Nelson River (221,000 sockeye salmon), Ilnik River (81,000 sockeye salmon), Meshik River (134,100 sockeye salmon), and Cinder River (191,300 sockeye salmon; Appendix A1 and Table 14). In addition, Swanson Lagoon, located in the Northwestern District, did not meet its escapement goal with only 400 sockeye salmon observed through aerial survey (Appendix A1).

## Nelson River

In 2018, 261,000 sockeye salmon escaped into streams in the Nelson Lagoon Section (Table 4), of which 221,000 fish returned to Nelson River, along with 6,000 returning to David's River, and 34,000 returning to Caribou River (Appendix A1). The Nelson River weir sockeye salmon
escapement of 221,000 fish exceeded the escapement goal of $97,000-219,000$ sockeye salmon and was above the 10 -year average of 203,490 fish (Tables 14 and 15; Schaberg et al. 2015). The peak daily escapement ( 25,806 fish) at the Nelson River weir occurred on July 14 (Table 15).
Nelson River is the only North Alaska Peninsula river system that has a female sockeye salmon escapement objective. In some years, high numbers of female sockeye salmon have been harvested in the commercial fishery, reducing the quality of escapement. To account for this, the proportion of female sockeye salmon passing the weir is determined through periodic sampling. That proportion is then extrapolated to account for the entire day's escapement. When the weir was removed on July 24, it was estimated that about 101,458 female sockeye salmon had passed the weir, meeting the management escapement objective of 50,000-110,000 female fish (Murphy and Johnson 2018).

## Bear River

Bear River has early and late sockeye escapement goals because the river is recognized as having two distinct temporally separated runs. In 2018, the Bear River early run (before August 1) exceeded the upper end of the escapement goal range of $176,000-293,000$ fish, with an escapement of 324,093 sockeye salmon, while the late run (after July 31) also exceeded the escapement goal of $117,000-195,000$ fish, with an escapement of 232,907 sockeye salmon (Tables 16 and 17; Schaberg et al. 2015). The largest daily escapement at the weir in 2018 occurred on July 6 when 41,417 sockeye salmon were counted (Table 17).

## Sandy River

The total 2018 Sandy River sockeye salmon escapement of 35,000 fish, which met the escapement goal range of $34,000-74,000$ fish, was below the 10 -year average escapement of 70,180 fish (Tables 14 and 18; Schaberg et al. 2015). The largest daily escapement at the Sandy River weir occurred on July 9 when 1,875 sockeye salmon were counted (Table 18).

## Ilnik River

In 2018, a total of 81,000 sockeye salmon passed the Ilnik River weir (Table 19, Appendix A1). The total Ilnik River escapement exceeded the escapement goal of 40,000-60,000 fish, and was comparable to the 10-year average of 77,130 fish (Table 14; Schaberg et al. 2015). The largest daily escapement at the Ilnik River weir occurred on June 28 when 6,670 sockeye salmon passed the weir (Table 19).

## Meshik and Cinder Rivers

The majority of escapement in Port Heiden is made up of fish spawning in Meshik River. Escapements into Meshik River and its tributaries are determined by aerial surveys. In 2018, 134,100 sockeye salmon were documented in the Meshik River (including Red Bluff Creek) exceeding the escapement goal of 48,000-86,000 fish (Appendix A1 and A2; Schaberg et al. 2015). This was well above the 10-year average of 100,609 fish (Table 14).

Cinder River had a total sockeye salmon escapement of 191,300 fish, exceeding the escapement goal of $36,000-94,000$ fish (Table 14). Escapement into Cinder River and its tributaries is determined by aerial surveys.

## Coho Salmon

Due to time and logistical constraints coho salmon surveys are conducted before the peak of coho salmon returns. Actual escapement into streams on the North Peninsula is likely much greater than what was observed by aerial survey. Nelson and Ilnik rivers are the only rivers on the North Alaska Peninsula that have a coho salmon lower-bound SEG. At Nelson River the peak escapement estimate of 44,000 coho salmon (determined by aerial surveys) exceeded the goal of 18,000 fish (Appendix A1; Schaberg et al. 2015). In 2018, a total of 122,000 coho salmon were observed in the Ilnik River (Appendix A1). The peak escapement estimate of 122,000 coho salmon for the Ilnik River system far exceeded the escapement goal of 9,000 fish (Schaberg et al. 2015). Some of the larger estimated escapements occurred in the Meshik River ( 63,000 coho salmon), Cinder River ( 66,000 coho salmon), and Lawrence Valley ( 6,000 coho salmon; Appendix A1).

Approximately 343,300 coho salmon were documented by aerial surveys in 24 North Alaska Peninsula streams during 2018 (Appendix A1 and A2).

## Pink SALMON

Even-numbered year pink salmon escapements are typically larger than odd-numbered year escapements on the Alaska Peninsula. The 2018 North Alaska Peninsula estimated total pink salmon escapement of 51,043 fish was below the 2008-2017 even-year average of 60,867 fish (Table 1; Appendix A1). The majority of the pink salmon escapement occurred in the Northern District (39,943 fish; Appendix A1), accounting for $78 \%$ of the total escapement for the North Peninsula.

## CHUM SALMON

The North Alaska Peninsula has two aggregate chum salmon escapement goals, one for the Northern District and one for the Northwestern District. In 2018, the Northern District chum salmon escapement of 236,109 fish met the escapement goal of 119,600-239, 200 fish (Table 8; Appendix A1; Schaberg et al. 2015). Historically the Herendeen-Moller Bay Section has the largest chum salmon run in the Northern District. In 2018, Herendeen and Moller bays accounted for about $30 \%$ of the total Northern District chum salmon escapement (85,030 fish; Table 8). The remaining chum salmon escapement in the Northern District is shown in Table 8. The Northwestern District chum salmon escapement of 90,705 fish did not meet the goal of 100,000215,000 fish, and was below the previous 10-year average of 130,779 fish (Table 9; Schaberg et al. 2015). The aggregate North Alaska Peninsula estimated chum salmon escapement of 326,814 fish was comparable to the 10-year average of 309,728 fish (Table 1).

## COMMERCIAL SALMON FISHERY SUMMARY

The majority of the North Alaska Peninsula commercial fishing effort targeting sockeye salmon occurred in the Nelson Lagoon, Bear River, Three Hills, Ilnik, and Outer Port Heiden sections in the Northern District. The total Northern District sockeye salmon harvest of 2,350,646 fish was above the 10 -year average of $1,998,486$ fish (Table 4). A complete listing of all commercial salmon harvested by day on the North Peninsula can be found in Table 20.

## NORTHWESTERN DISTRICT

During the 2018 Northwestern District commercial salmon fishery, a total of 3 Chinook, 7,181 sockeye, 9,683 coho, 2,509 pink, and 105,705 chum salmon were harvested (Table 21). The Northwestern District has only a few large sockeye salmon producing systems and receives less commercial fishing effort than the Northern District. Traditionally, chum salmon are the most harvested species in the Northwestern District, followed by sockeye, however in 2018 more coho salmon were harvested in the Northwestern District than sockeye. In 2018 all of the commercial salmon fishing effort occurred in the Izembek-Moffet Bay Section. No commercial salmon fishing effort occurred during open periods in the Dublin Bay, Bechevin Bay, and Urilia Bay sections. The Swanson Lagoon Section was closed for the 2018 season due to low sockeye salmon escapement.
The 2018 sockeye salmon harvest in the Northwestern District of 7,181 fish was below the 10year average harvest of 44,254 fish (Table 22). All sockeye salmon harvested in the Northwestern District were harvested in the Izembek-Moffet Bay Section (7,181 fish; Table 21). The Northwestern District chum salmon harvest of 105,705 fish in 2018 was comparable to the 10 -year average harvest of 117,874 fish (Table 9). All chum salmon harvested in the Northwestern District were harvested in the Izembek-Moffet Bay Section (105,705 fish; Table 9). The pink salmon harvest of 2,509 fish was below the 2008-2017 even-year average of 5,452 fish (Table 7).

## NORTHERN DISTRICT

## Black Hills Section

The Black Hills Section may open to commercial salmon fishing starting May 1 (5 AAC 09.310 (a)(10)). In 2018, 3 permit holders harvested 2,318 sockeye salmon and 1,101 chum salmon in the Black Hills Section (Table 2). Regularly scheduled weekly fishing periods occurred throughout the fishing season. The sockeye salmon harvest was below the 10 -year average of 28,352 fish (Table 4). The chum salmon harvest was well below the 10 -year average of 17,354 fish (Table 8). Confidentiality rules prohibit the reporting of harvest by date in the Black Hills Section.

## Nelson Lagoon Section

The Nelson Lagoon Section may open to commercial salmon fishing on May 1 (5 AAC 09.310 (a)(8)). Fishing times are based on the evaluation of the Nelson River sockeye salmon stocks from mid-June to mid-August (5 AAC 09.369 (e)(2)). During the 2018 commercial salmon fishing season, the Nelson Lagoon Section was open during regularly scheduled weekly fishing periods throughout the season, with extensions occurring weekly (Tables 23 and 24). The total Nelson River system run, consisting of the Nelson Lagoon Section harvest and escapements of all Nelson River tributaries, was 426,303 sockeye salmon (Table 4). A total of 30 permit holders harvested 165,303 sockeye salmon (Table 24) which was below the 10 -year average harvest of 207,327 fish (Table 4; Figure 8). The first day of salmon harvest in the Nelson Lagoon Section occurred on June 11 and the last day was September 5. The peak daily catch was on July 14 when 23 permit holders harvested 19,880 sockeye salmon (Table 24). The largest weekly harvest in Nelson Lagoon occurred between July 12 and July 18 when 68,779 sockeye salmon were harvested (Table 2; Figure 9).

After August 15, the Nelson Lagoon Section is managed based on coho salmon run strength at Nelson River. A total of 31,058 coho salmon were harvested in the Nelson Lagoon Section during 2018, which is comparable to the recent 10 -year average of 33,056 coho salmon (Table 6).

## Bear River and Three Hills Sections

By regulation, the Bear River Section may open to commercial salmon fishing on May 1, while the Three Hills Section may open on June 25 (5 AAC 09.310 (a)(4)(5)). Fishing times in the Bear River and Three Hills sections are based on the evaluation of the sockeye salmon stocks of the Bear and Sandy rivers through June and July (Murphy and Johnson 2018).
In 2018, the Bear River early run was approximately one week late, but slightly above average when compared to previous years. Interim escapement objectives were not met at Bear River until July 5, after which all objectives were met for the remainder of the season. Area management staff, taking into account the run timing, managed for the week long delay. The Sandy River run was weak, and interim escapement objectives were not met until the end of the season. Management actions were taken throughout the season to ensure the season ending escapement goal at Sandy River of $34,000-74,000$ sockeye salmon was ultimately met with a total of 35,000 sockeye salmon passed the weir. Commercial fishing was allowed in early June in the Bear River Section, but no harvest effort occurred. Between June 14 and July 8 commercial fishing was closed in the Bear River Section while the run built in strength. Starting June 25, the Three Hills Section was closed as well in order to allow the run to build. Commercial fishing occurred from July 8 through July 27 in both the Bear River and Three Hills sections. The Bear River and Three Hills sections were both closed July 27 in order to allow the Bear River late run to develop (Table 25).

The late Bear River sockeye run begins August 1. Traditionally a test fishery is conducted in early August; however, in 2018 the test fishery was conducted on July 30 (Table 26). On July 30 ADF\&G chartered 9 drift gillnet vessels to conduct a combination cost recovery and test fishery, which was used to provide funding for North Alaska Peninsula management operations, and to assess the strength of the Bear River late run (Appendix B). The results of the fishery did not indicate that there was a harvestable surplus, and the commercial fishery remained closed until August 6. The Bear River and Three Hills sections reopened to commercial salmon fishing on August 6, with 1,000-yard markers in effect around the mouth of Bear River, allowing milling fish an opportunity to enter the river while providing some commercial salmon harvest opportunity (Table 23). The 1,000-yard markers remained in effect for the remainder of the 2018 season.

Harvest in the Bear River Section occurred from July 8 to September 5. A total of 99 permit holders harvested 397,206 sockeye salmon which was above the 10 -year average harvest of 329,789 fish (Tables 4 and 25). The largest weekly harvest in the Bear River Section of 93,128 sockeye salmon occurred between July 12 and July 18 (Table 2; Figure 10). The largest daily harvest of 34,148 sockeye salmon occurred on August 7 (Table 25). The total late-run harvest of 549,783 sockeye salmon (includes harvests in the Port Moller Bight, Three Hills, and Ilnik sections after August 1) was well above the most recent 10-year average of 240,412 fish while the late-run escapement ( 232,907 fish) was above the most recent 10 -year average of 170,572 fish (Table 16).

Harvest in the Three Hills Section occurred from July 9 until September 8. A total of 361,790 sockeye salmon were harvested by 115 permit holders (Tables 4 and 27). The 2018 sockeye salmon harvest was above the most recent 10-year average of 105,079 fish (Table 4).
In 2018, the Ocean River played a role in the management of the Three Hills Section. Ocean River, normally a tributary of the Ilnik River, often changes course over the winter, sometimes emptying into the Bering Sea near the Ilnik/Three Hills dividing line. In 2018, Ocean River ran parallel to the beach for several miles before emptying into Ilnik River. When this occurs fish can mill on the coast at the border of the Ilnik and Three Hills sections looking for the entrance to Ocean River, before traveling up the coast and into Ilnik Lagoon and finally into the Ocean River. As a precautionary measure, that portion of the Three Hills Section (located east of $159^{\circ}$ 54 ' W long) was closed to commercial salmon fishing until July 13, when it became apparent that Ocean River would achieve adequate escapement.

## Ilnik Section

The Ilnik Section may open to commercial salmon fishing on June 20, depending on escapement levels in the Ilnik and Meshik rivers (5 AAC 09.369(j)(1)(A)). Management of the Ilnik Section northeast of Unangashak Bluffs is based on the Ilnik River weir sockeye salmon escapement and Meshik River sockeye salmon escapement (determined by aerial surveys). In that portion of the Ilnik Section southwest of Unangashak Bluffs, management actions are based on Ilnik River weir escapement levels from June 20 to July 20. Between July 21 and August 15, the Ilnik Section is based on the abundance of Bear River sockeye salmon stocks (Murphy and Johnson 2018).

In 2018, the Ocean River played a role in the management of the Ilnik Section. Ocean River, normally a tributary of the Ilnik River, often changes course over the winter, sometimes emptying into the Bering Sea near the Ilnik/Three Hills dividing line. In 2018, Ocean River ran parallel to the beach for several miles before emptying into Ilnik River. When this occurs fish can mill on the coast at the border of the Three Hills and Ilnik sections looking for the entrance to Ocean River, before traveling up the coast and into Ilnik Lagoon and finally into Ocean River. As a precautionary measure that portion of the Ilnik Section (located west of $159^{\circ} 46^{\prime} \mathrm{W}$. long.) was closed to commercial salmon fishing until July 13, when it became apparent that Ocean River would achieve adequate escapement.

A total of 132 permit holders harvested $1,067,597$ sockeye salmon in the Ilnik Section (Table 28). The first harvest in the Ilnik Section occurred on July 5 and the last delivery occurred on September 5 (Table 28). About $50 \%$ of the harvest ( 532,636 sockeye salmon) occurred in Northeast Ilnik, and $50 \%$ ( 534,961 sockeye salmon) were harvested in Southwest Ilnik (Table 21; Figure 4). The 2018 peak daily catch was on July 11 when 106,487 sockeye salmon were harvested (Table 28). The largest weekly harvest occurred between July 5 and July 11 when 452,186 sockeye salmon were harvested (Table 2).
After August 15, by regulation, management of the Ilnik Section is based off of coho salmon runs into Ilnik Lagoon. In 2018 a total of 33,134 coho salmon were harvested in the Ilnik Section (Table 6).

A small amount of commercial salmon fishing effort occurred inside Ilnik Lagoon in 2018; this was the first time commercial fishing effort was conducted inside Ilnik Lagoon since 1998. Confidentiality rules prohibit the reporting of harvest numbers in the Ilnik Lagoon during 2018,
however the catch was an extremely small portion of all fish caught in the Ilnik Section (Table 21).

## Outer Port Heiden Section

By regulation, the Outer Port Heiden Section may open to commercial salmon fishing from June 20 through July 31 (5 AAC 09.310(a)(2)(B)). Fishing time in the Outer Port Heiden Section is based on Meshik River sockeye salmon abundance unless management actions are taken for the conservation of Ugashik River sockeye salmon in the Egegik District (Murphy and Johnson 2018, 5 AAC 09.369(j)(1)(B)).
The weekly fishing period in the Outer Port Heiden Section allows two and one-half days of fishing time per week. In 2018, the first commercial salmon fishing period of two and one-half days occurred in the Outer Port Heiden section on June 27. Two and one-half days of fishing time were allotted per week until July 31 when the Outer Port Heiden Section closed for the season (Table 23). A total of 127 permit holders harvested 356,014 sockeye salmon from the Outer Port Heiden Section (Table 29). The peak daily catch was on June 29 when 112 permit holders harvested 40,823 sockeye salmon (Table 29). The largest weekly harvest of 135,381 sockeye salmon occurred between June 28 and July 4 (Table 2; Figure 10). The number of permit holders fishing in the Outer Port Heiden Section in 2018 was comparable to the previous five-year average (Figure 11), while the sockeye salmon harvest was below the 10-year average of 519,132 fish (Table 4).

## Inner Port Heiden and Cinder River Sections

The Inner Port Heiden and Cinder River sections are both part of the Area M/Area T overlap. There was no commercial fishing effort in the Inner Port Heiden Section in 2018. Confidentiality requirements prohibit the release of harvest information regarding the Cinder River Section; however, the catch was negligible. Commercial fishing effort has not significantly or consistently occurred in either the Inner Port Heiden or Cinder River sections since the late 1990s. Table 30 provides historical harvest data for the Area M/Area T overlap area.

## EXVESSEL VALUE

Appendix C provides a brief summary of exvessel values of the 2018 North Alaska Peninsula commercial salmon fisheries.

The total exvessel value of the 2018 North Alaska Peninsula commercial salmon fisheries is estimated to be $\$ 16,547,689$, well above the recent 10 -year average of $\$ 10,836,488$ (Appendix C1). During 2018, sockeye salmon sold for an average price of $\$ 1.25$ per pound, and Chinook salmon sold for $\$ 1.55$ per pound. The price per pound of sockeye and Chinook salmon were both higher than both the 2017 season ( $\$ 1.00$ and $\$ 1.48$ respectively), and the most recent 10 -year averages of $\$ 0.88$ and $\$ 1.09$ respectively (Appendix C2). The price per pound of coho salmon ( $\$ 0.30$ ) was comparable to the 2017 price ( $\$ 0.32$ ) but less than the most recent 10-year average price per pound of $\$ 0.43$ (Appendix C2). Pink salmon were only incidentally harvested on the North Alaska Peninsula during 2018. Chum salmon were bought by processors for an average of $\$ 0.35$ per pound, which was above the 2017 price of $\$ 0.27$, and comparable to the most recent 10 -year average of $\$ 0.32$ (Appendix C2).
Sockeye salmon made up the majority of the value of the fishery, totaling $\$ 15,830,834$, or approximately $96 \%$ the total value (Appendix C3). Chum and coho salmon were the next most
valuable species in that order, at $\$ 401,509$ and $\$ 238,180$ (Appendix C1). Coho salmon catches were largely incidental to other targeted species during 2018.

Drift gillnet permits in the Northern District caught \$15,315,063 worth of salmon, accounting for $93 \%$ of the total value of the North Alaska Peninsula fishery. Set gillnet permits in the Northern District accounted for $\$ 870,273$ (5\%) of the value, followed by purse seine permits in the Northwestern District and their catch of \$329,989 (2\%; Appendix C3).

## EMERGENCY ORDERS

In 2018, there were a total of 29 emergency orders issued concerning North Alaska Peninsula salmon fisheries (Table 23). The first emergency order for the North Alaska Peninsula was issued on June 17 and the last on September 5. Emergency orders for North Alaska Peninsula fisheries were issued from the regional Alaska Department of Fish and Game offices in Port Moller for the Northern District, and in Sand Point for the Northwestern District in 2018.

Note: Catch numbers do not include test fish harvest or fish retained for personal use.
${ }^{\text {a }}$ Outer Port Heiden Section catches occurred only between 1986 and 1989, and from 2007 onward. This section was closed between 1990 and 2006.
${ }^{\text {b }}$ Inner Port Heiden escapements include Meshik River, Red and Yellow Bluff creeks and minimal escapements from Birthday and Charles creeks.
$\pm \quad$ c Escapement includes all sockeye systems, mainly Bear and Sandy Rivers combined with post weir estimates.
d Nelson Lagoon escapement includes tributaries David's and Caribou Rivers.
e Escapements are indexed totals except for Bear, Sandy, Ilnik, and Nelson Rivers where weir and tower counts are used.
f Ilnik Section and Three Hills Section combined.
g These figures are extrapolated estimates.
${ }^{h}$ Confidentiality rules prohibit reporting.
i This aggregate includes numbers omitted for confidentiality purposes.

Table 5.-Port Moller Bight, Bear River, Three Hills, and Ilnik sections combined salmon harvest by species and day, 2018.

Note: Catch numbers do not include test fish harvest or fish retained for personal use. Differences in totals may occur between tables due to confidentiality requirements.
a Statistical area 311-58 was moved from the Bechevin Bay Section to the Izembek-Moffet Bay Section in 2001.
${ }^{\text {b }}$ Catch numbers include a small harvest from the Dublin Bay Section in 1983, 2006 and 2011.
c Escapements are indexed totals.
d Averages include only the even-numbered years 2008, 2010, 2012, 2014 and 2016.

Note: Catch numbers do not include test fish harvest or fish retained for personal use. Differences in totals may occur between tables due to confidentiality requirements.
a Statistical area 311-58 was moved from the Bechevin Bay Section, to the Izembek-Moffet Bay Section in 2001.
b Catch numbers include a small harvest from the Dublin Bay Section in 1983, 2006, and 2011.
c Escapements are rounded indexed totals.

Table 14.-Historical North Alaska Peninsula sockeye salmon escapements and escapement goals, 1988-2018.

-continued-

Table 14.-Page 2 of 2.
a Does not include David's or Caribou rivers.
b Escapement is based on weir counts and post weir escapement estimates. Only those years when weirs were present are included in the table.
c From 2005-2010, 2012-2013, and 2016, the Ocean River did not flow into Ilnik Lagoon. For those years, Ocean River escapements have been added to the Ilnik River weir count.
d Escapements are estimates based on aerial surveys.
e Meshik River escapement includes Red and Yellow Bluff creeks (tributaries).
f Cinder River escapement includes Mud Creek (a tributary).

${ }^{\text {a }}$ Due to significant high water events and inclement weather, these numbers are estimates.
b Weir was removed the following day.
c Post weir escapement estimates were determined using aerial surveys, commercial fishery performance, run timing indicators, effort levels, and weather conditions to provide a reasonable estimate of escapement levels after weir was removed.

Note: With notable exceptions, all escapements are tabulated from aerial survey observations.
a Aerial surveys for coho are conducted in late August and early September, well before the peak of local coho salmon runs. Actual escapements are likely greater than observed.
b These escapements are generated from weir counts.

## BEAR RIVER TEST FISHERY UPDATE \#1

On July 30, 9 drift gillnet vessels participated in a test fishery. The harvest in number of fish was:

Chinook: 0
Sockeye: 12,527
Coho: 0
Pink: 0
Chum: 86
There are no changes to any commercial fishery announcements at this time.

Statistical charts and harvest strategies are available at the Sand Point and Port Moller Fish and Game offices. Commercial salmon fishing regulations, commercial harvest, escapement, and news releases can be found on the ADF\&G website at:
http://www.adfg.alaska.gov/index.cfm?adfg=commercialbyareaakpeninsula.salmon
Salmon fishery announcements will be broadcast on VHF channel 72 daily at 9:00 a.m. and 8:00 p.m. and may also be obtained from ADF\&G in Port Moller at 375-2716.

## APPENDIX C. SUMMARY OF NORTH ALASKA PENINSULA EXVESSEL VALUE

Appendix C1.-Summary of commercial salmon fishing exvessel value for the North Alaska Peninsula, 1996-2018.

| Year | Gear Name | Exvessel value |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Chinook | Sockeye | Coho | Pink | Chum | Total |

Note: Exvessel values do not include processor bonuses, incentives, refrigerated seawater prices, or post season adjustments. Due to omissions from fish tickets, these values are estimated using average price per pound values for the entirety of Area M. Due to rounding, totals may differ slightly from other tables.

Appendix C2.-Average weights and approximate exvessel prices for salmon in the Alaska Peninsula, Aleutian Islands, and Atka-Amlia areas, 1987-2018.

[^1]:    2 The Sustainable Salmon Fisheries Policy (5 AAC 39.222) defines escapement as the annual estimated size of the spawning salmon stock; quality of the escapement may be determined not only by numbers of spawners, but also by factors such as sex ratio, age composition, temporal entry into the system, and spatial distribution within the salmon spawning habitat.

[^2]:    -continued-

[^3]:    Note: Catch numbers do not include test fish harvest or fish retained for personal use.
    a Escapements are estimated totals.
    b These figures are estimates based on limited data.
    c Number of fish in thousands.
    d Escapement estimates are a minimum count.
    e No surveys were conducted in the Northern District.
    f Averages for pink salmon include only the even-numbered years 2008, 2010, 2012, 2014, 2016.

[^13]:    -continued-

[^14]:    a Weir removed the following day.
    b Post weir escapement estimates were determined using aerial surveys, commercial fishery performance, run timing indicators, effort levels, and weather conditions to provide a reasonable estimate of escapement levels after weir was removed.
