## Symbols and Abbreviations

The following symbols and abbreviations, and others approved for the Système International d'Unités (SI), are used without definition in the following reports by the Divisions of Sport Fish and of Commercial Fisheries: Fishery Manuscripts, Fishery Data Series Reports, Fishery Management Reports, and Special Publications. All others, including deviations from definitions listed below, are noted in the text at first mention, as well as in the titles or footnotes of tables, and in figure or figure captions.

| Weights and measures (metric) General |  |  |  | Mathematics, statistics all standard mathematical signs, symbols and abbreviations |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| centimeter | cm | Alaska Administrative |  |  |  |
| deciliter | dL | Code | AAC |  |  |

# FISHERY MANAGEMENT REPORT NO. 18-32 

# CHIGNIK MANAGEMENT AREA SALMON ANNUAL MANAGEMENT REPORT, 2018 

by<br>Dawn M. Wilburn<br>and<br>Ross L. Renick<br>Alaska Department of Fish and Game, Division of Commercial Fisheries, Kodiak

Alaska Department of Fish and Game
Division of Sport Fish, Research and Technical Services 333 Raspberry Road, Anchorage, Alaska, 99518-1565

The Fishery Management Reports series was established in 1989 by the Division of Sport Fish for the publication of an overview of management activities and goals in a specific geographic area, and became a joint divisional series in 2004 with the Division of Commercial Fisheries. Fishery Management Reports are intended for fishery and other technical professionals, as well as lay persons. Fishery Management Reports are available through the Alaska State Library and on the Internet: http://www.adfg.alaska.gov/sf/publications/. This publication has undergone regional peer review.

#### Abstract

This report summarizes the 2018 commercial Pacific salmon Oncorhynchus spp. fisheries within the Chignik Management Area (CMA; Area L). All 5 species of North American Pacific salmon are commercially harvested in the CMA: Chinook O. tshawytscha, sockeye O. nerka, coho O. kisutch, pink O. gorbuscha, and chum O. keta salmon. The 2018 Chignik River Chinook salmon escapement of 825 fish was below the escapement goal range of 1,300 to 2,700 fish. The Chignik River early-run sockeye salmon escapement ( 263,979 fish) did not meet the earlyrun escapement goal range ( 350,000 to 450,000 fish) while the late-run sockeye salmon escapement ( 275,718 fish) was just within the lower bound of the escapement goal range (275,000 to 400,000 fish). Indexed peak pink salmon escapement was estimated at 41,900 fish, approximately $22 \%$ of the minimum required to achieve the lower bound of the even-year sustainable escapement goal (SEG) range of 170,000 to 280,000 fish. Indexed peak chum salmon escapement was well below average, with the peak escapement of 33,400 chum salmon falling below the SEG range of 45,000 to110,000 fish. A total of 128 sockeye, 1 coho, 6 pink, and 924 chum salmon were harvested. The overall 2018 CMA harvest was minimal and therefore below all recent averages. Sockeye salmon is the species that typically receives the most focus from the commercial fishing effort and the recent harvest has averaged approximately 1.4 million fish in the CMA. Harvest opportunity was limited in 2018 with 2 fishing periods of 48hours confined to inner bays where effort targeted local stocks of coho, pink and chum salmon. There were no commercial openings targeting sockeye salmon in 2018. Of the 91 permits issued in the CMA, a total of 6 permit holders made deliveries. The exvessel value for commercial salmon harvest in the CMA totaled approximately \$3,041.

Key words: Chignik Management Area (CMA), Chignik River, Oncorhynchus, salmon, Alaska Board of Fisheries, 2018 commercial fisheries management, Chignik Salmon Management Plan, harvest, escapement

## INTRODUCTION

This report provides a summary of the 2018 commercial salmon management plan, fishing activity, escapements, and harvests in the Chignik Management Area (CMA). Most tables in this report have been verified against the Westward Region electronic fish ticket (1970 to present) and historical escapement databases (1960 to present). The salmon harvest estimates reported in this document were summarized from the fish ticket database on November 1, 2018. Data published in this report supersede any data previously published.
The Alaska Department of Fish and Game (ADF\&G) manages all commercial Pacific salmon Oncorhynchus spp. fisheries within the Chignik Management Area (CMA; Area L). The CMA encompasses all coastal waters and inland drainages of the northwest Gulf of Alaska between Kilokak Rocks and Kupreanof Point (Figure 1). For management purposes, these waters are divided into 5 fishing districts: Eastern, Central, Chignik Bay, Western, and Perryville districts (Figure 2). There are over 100 salmon producing streams in the CMA. The Chignik River system, located in the Chignik Bay District, is the major sockeye salmon producer and supports two genetically distinct runs.

There are 5 species of Pacific salmon that are commercially harvested in the CMA: Chinook Oncorhynchus tschawytscha, sockeye O. nerka, coho O. kisutch, pink O. gorbuscha, and chum O. keta salmon. Sockeye salmon are the primary species targeted and the most important commercial and subsistence salmon species in the CMA although pink and chum salmon can contribute significantly to the CMA salmon harvest during certain years. Commercial salmon fishing is the economic mainstay for 5 villages: Chignik Bay, Chignik Lagoon, Chignik Lake, Perryville, and Ivanof Bay (Figure 1).

## COMMERCIAL SALMON

## Overview of Management Plans

The 2018 CMA commercial salmon fishery was managed based on the Chignik Salmon Management Plan (5 AAC 15.357) ${ }^{1}$. Sockeye salmon bound for the Chignik River watershed were also allocated under 2 additional management plans: The Cape Igvak Salmon Management Plan (5 AAC 18.360) ${ }^{2}$ in the Kodiak Management Area (Area K) and the Southeastern District Mainland (SEDM) Salmon Management Plan (5 AAC 09.360) ${ }^{1}$ in the Alaska Peninsula Management Area (Area M; Figure 1).

## Chignik Salmon Management Plan

The Chignik Salmon Management Plan (5 AAC 15.357) was originally adopted in 1999. The goal of this plan is to allow traditional salmon fisheries in the CMA while achieving the established escapement goals for early-run (Black Lake) and late-run (Chignik Lake) sockeye salmon (Table 1) as well as local stocks of Chinook, pink, coho, and chum salmon. Purse seines and hand purse seines are the only legal commercial salmon fishing gear within the CMA. Legal seine gear ranges from 100 to 125 fathoms in length in the Chignik Bay District and from 100 to 225 fathoms in length in all other districts (5 AAC 15.332).

## Cape Igvak Salmon Management Plan

The Cape Igvak Salmon Management Plan (5 AAC 18.360) was officially adopted in 1978 and has since undergone several amendments to change allocation criteria in the management plan (Jackson et al. 2015). The Cape Igvak Section is the westernmost section of Area K, located directly northeast of the CMA (Figure 1). Under the current plan criteria, from June 1 through July 25, $90 \%$ of the sockeye salmon harvested within the Cape Igvak Section are allocatively considered to be Chignik-bound (5 AAC 18.360(d)). If the harvestable surplus of sockeye salmon in the CMA is above or expected to be above certain thresholds (5 AAC 18.360 (a-c)), then $15 \%$ of the total Chignik sockeye salmon harvest (total includes sockeye salmon caught in the CMA, in the Cape Igvak Section, and within certain portions of SEDM) is allocated to Area K fishermen. After July 25, there are no allocative ties between the CMA and Area K.

## Southeastern District Mainland Salmon Management Plan

The Southeastern District Mainland Salmon Management Plan (5 AAC 09.360) was formally adopted in 1980 and has undergone several amendments, mostly to allocation criteria (Fox et al. 2017). The SEDM is composed of a group of sections in the eastern end of Area M, located directly southwest of the CMA (Figure 1). Under the current plan criteria, from June 1 through July $25,80 \%$ of the sockeye salmon harvested within certain SEDM sections during specific times are allocatively considered to be Chignik-bound. If the harvestable surplus of sockeye salmon in the CMA is above or expected to be above certain thresholds, then $7.6 \%$ of the total estimated CMA sockeye salmon harvest is allocated to SEDM fishermen (5 AAC 09.360 (a-g)). After July 25, there are no allocative ties between the CMA and Area M.

[^0]
## Inseason Management

ADF\&G manages all CMA commercial salmon resources by emergency order based on inseason evaluation of local stock abundance and escapement objectives. A weir operated on the Chignik River, typically from late May through early September, provides daily escapement counts used to manage much of the commercial fisheries in the CMA. Aerial surveys from a fixed wing aircraft are used to enumerate local stocks of pink, chum, and coho salmon that return to systems in the CMA without weirs.

Inseason management of the CMA commercial salmon fishery is structured around 5 districts that are further broken down into 13 sections (Figure 2). These districts and sections are further subdivided into statistical reporting areas for harvest reporting and management purposes.

## Chignik Bay and Central Districts Commercial Salmon Fishery

The first commercial fishing period may not open in the CMA until at least 20,000 sockeye salmon have escaped into the Chignik River, or if ADF\&G determines that a strong buildup of sockeye salmon exists in the Chignik Lagoon and it is anticipated that 20,000 sockeye salmon will escape into the Chignik River. The purpose of this regulation is to allow subsistence fishing opportunity prior to the commercial fishing season and to avoid a large buildup of salmon in the lagoon.

Once the 20,000 sockeye salmon minimum has been achieved or is expected to be achieved, the Chignik Bay and Central districts (Figure 2) may open concurrently as long as the Chignik Lakes' sockeye salmon runs are meeting escapement objectives (5 AAC 15.357 (b)). Management action may also be taken for local stocks of Chinook, coho, pink, and chum salmon.

## Eastern District Commercial Salmon Fishery

The Eastern District (Figure 2), by regulation (5 AAC 15.357 (c)(1)), must open concurrently with the Chignik Bay and Central districts during June. From approximately June 26 through July 8, commercial fishing may be restricted or disallowed while ADF\&G evaluates the strength of the late-run sockeye salmon (5 AAC 15.357(c)(2)(B). For the remainder of the season, management of the Eastern District is based on local pink and chum salmon stocks as well as the strength of the Chignik River sockeye salmon runs (5 AAC 15.357 (c)(3)).

## Western and Perryville Districts Commercial Salmon Fishery

By regulation, the Inner Castle Cape Subsection of the Western District opens concurrently with the Chignik Bay and Central districts throughout the commercial salmon fishing season (5 AAC 15.357 (b); Figures 2 and 3). Also by regulation (5 AAC 15.357 (e)), the Western District, excluding the Inner Castle Cape Subsection, may open to commercial salmon fishing for two 48hour periods concurrently with the Chignik Bay and Central districts through July 5. There must be a minimum 48-hour closure between the two fishing periods.

Excluding the Inner Castle Cape Subsection of the Western District, and the 48-hour fishing periods, the Western and Perryville districts are closed to commercial salmon fishing through July 5 (5 AAC 15.357 (d)). Beginning July 6, these districts are managed based on the run strength of late-run sockeye salmon. After the transition period from predominantly early-run sockeye salmon to late-run sockeye salmon (usually mid-July), these districts are managed based
on local pink and chum salmon escapements, as well as late-run sockeye salmon escapement into the Chignik River.

## Escapement Goals

In 2015, a salmon escapement goal review team, including staff from the Division of Commercial Fisheries and the Sport Fish Division, was formed to review salmon escapement goals in the CMA (Schaberg et al. 2015). The team recommended changing the areawide evenyear and odd-year pink salmon sustainable escapement goals (SEG), as well as the areawide chum salmon SEG. These new goals were targeted beginning in the 2016 season.

The new areawide pink salmon escapement goals were developed based on 8 index systems distributed throughout 4 of the 5 fishing districts of the CMA. These 8 systems have consistently been surveyed and have represented approximately $53 \%$ of the annual pink salmon indexed escapement over the last 35 years. The new chum salmon goal was developed based on 6 index systems distributed throughout 4 of the 5 fishing districts that have represented approximately $57 \%$ of the annual chum salmon indexed escapement over the last 35 years. During past seasons, ADF\&G has surveyed 49 pink salmon index streams and 42 chum salmon index streams in order to monitor the CMA salmon runs and to calculate an escapement estimate based on peak aerial surveys. These streams will continue to be monitored by ADF\&G in season to evaluate the health and spatial distribution of the CMA pink and chum salmon runs. The new areawide pink salmon SEG in even years is $170,000-280,000$ fish and in odd years $260,000-450,000$ fish. The new chum salmon SEG is $45,000-110,000$ fish.

There were no changes recommended to any of the other established CMA salmon escapement goals, which remained as follows: the Chignik River Chinook salmon biological escapement goal (BEG) range of 1,300-2,700 fish; the early-run sockeye salmon BEG of 350,000-450,000 fish (Table 1); and the late-run sockeye salmon SEG of 275,000-400,000 fish. The late-run SEG includes an Inriver Run Goal (IRRG) of 75,000 fish added to the lower bound of the goal range for late season subsistence needs. The IRRG was increased at the 2016 Board of Fisheries (BOF) meeting from 50,000 sockeye salmon ( 25,000 in August and 25,000 fish September 1-15) to 75,000 sockeye salmon (25,000 fish in August and 50,000 fish September 1-30; 5AAC 15.357(b)(3)(B)).

## ESCAPEMENT AND HARVEST DATA

## 2018 ESCAPEMENT INFORMATION

In 2018, the majority of salmon escapements to the Chignik River were estimated through the use of the Chignik River weir. There were 2 gates in the weir, which were open 24 hours a day to allow for unrestricted fish passage. Underwater video equipment was used to count fish passing through the weir gates. At night, lights incorporated in the camera gates allowed fish to be counted. The number of fish passing the weir, by species, were counted for the first 10 minutes of each hour, and then multiplied by 6 to obtain hourly escapement estimates. Hourly estimates were summed to provide an estimate of daily fish passage. Video footage from each 10 -minute escapement count was recorded and archived. Two Dual-frequency Identification Sonar (DIDSON) units were also deployed in the Chignik River from August 1 through September 6 to monitor escapement simultaneously with the Chignik River weir and to provide a comparison between the two methods. The DIDSONs were operated as part of an Alaska Sustainable Salmon Fund (AKSSF) grant project, which was in its third and final year.

All 5 species of North Pacific salmon were estimated through the weir in 2018. Since Dolly Varden Salvelinus malma are not commercially harvested or actively managed in the CMA, their escapement estimates are noted in the tables of this document for historical comparisons, but not discussed in detail in the escapement section below. Installation of the weir was completed on May 31 with the first escapement estimate of the 2018 season on June 1. The last full count through the weir was on August 18, after which the weir was removed due to a high-water event (Tables 2 and 3). Escapement continued to be monitored through September 6 with the use of the DIDSON. A post-weir/DIDSON sockeye salmon escapement estimate was produced using time series analysis for September 7-30.

DIDSON estimates were used this season and in 2015 due to the removal of the weir much earlier than normal. At the time of this report, ADF\&G plans to perform an analysis comparing the weir estimates to DIDSON estimates after the completion of the final year of the AKSSF grant. The purpose of the analysis is to determine the accuracy of DIDSON and whether development of a correction factor is necessary to calibrate DIDSON estimates to weir estimates. Once the analysis is complete, ADF\&G will determine if it is reasonable to apply the results to DIDSON escapement estimates from the past several years.

Aerial surveys were flown over the spawning grounds of the Chignik River watershed to assess sockeye salmon spawning escapement levels and distribution. Escapements to other CMA streams were also estimated via aerial surveys.

## Chinook Salmon

The Chignik River is the only stream with substantial Chinook salmon escapement within the CMA. Chinook salmon began entering the Chignik River in mid-June. The run peaked by midJuly and was over by early August (Table 3; Figure 4). The Chinook salmon run was poor and did not have a single day of escapement over 60 fish. The 2018 escapement ( 825 Chinook salmon) was below the BEG range of 1,300-2,700 fish and well below all recent averages (Table 4; Figure 5; Schaberg et al. 2015). Escapement was the lowest recorded since 1980 (876 fish).

## Sockeye Salmon

There are 2 genetically distinct sockeye salmon runs (an early and late run) that enter the Chignik River watershed and temporally overlap during late June and July (Templin et al. 1999). The early-run sockeye salmon mostly return to Black Lake and its tributaries while the late-run fish largely return to Chignik Lake and its tributaries. Commercial fishing time is regulated to reach interim escapement objectives for both runs therefore a method of estimating each stock in season is necessary.

From 1983 to 2004, scale pattern analysis (SPA) models were used to differentiate stock composition between early- and late-run fish, and the fishery was managed inseason based on the results of this analysis (Witteveen and Botz 2004). The Chignik SPA program was discontinued prior to the 2004 season due to funding limitations. However, examination of SPA data revealed that, on average, the number of early-run sockeye salmon that passed the Chignik River weir after July 4 was approximately equal to the number of late-run sockeye salmon that passed the weir prior to July 4. From 2004 through 2013, fishing periods were based on achievement of early-run escapement objectives through July 4, and then switched to late-run escapement objectives on July 5. Beginning in 2014, in-season management was based on results from genetic sampling of the sockeye salmon runs.

From 2010 through 2012, as part of an AKSSF project, sockeye salmon genetic samples were collected at the Chignik River weir approximately every 4-6 days before, during, and after the overlap period (11 sampling periods; Table 5). Genetic tissue (axillary process) was clipped from approximately 190 sockeye salmon each sampling event and was sent to ADF\&G's Gene Conservation Lab where genomic DNA was extracted and assayed for 96 sockeye salmon single nucleotide polymorphisms from each fish. The goal was to provide quantifiable inseason estimates of the contribution of both Black Lake (early run) and Chignik Lake (late run) sockeye salmon stocks to Chignik River escapement estimates (Russell and Foster 2014). Beginning in 2013, sampling intensity was reduced, with effort focused during the critical overlap period (6 sampling periods; Table 5). In 2013 and 2014, funding was jointly provided by Chignik Regional Aquaculture Association (CRAA) and ADF\&G. The 2015-2017 Chignik River sockeye salmon genetic sampling was again funded by AKSSF and genetic sampling in 2018 was funded by a Saltonstall-Kennedy Grant.
Samples during the 2014-2017 seasons were sent to the Gene Conservation Lab and analyzed with results available within 36-72 hours after sampling. Stock proportions obtained from each genetic sampling event were used in season by ADF\&G to attribute escapement simultaneously to the early- and late-run sockeye salmon escapement objectives. Run timing for Black and Chignik lakes was modeled using methods similar to SPA modeling (Witteveen and Botz 2004).
Due to the lag time in receiving the genetic results, incorporating inseason genetic estimates effectively as an adaptive management tool often proved to be difficult. In all the years of inseason genetic sampling (2010-2017), three timing categories for the run transition have been discernible: early, mid, and late. The crossover between the categories can happen quickly and often be determined by one data point; however, that is not known until several days after the fish have passed the weir when sample results are received. This uncertainty leads to a conservative management style that will often result in over-escapement of Black Lake fish. Due to these difficulties, ADF\&G decided that managing on a central tendency would lead to a greater chance of being within the range of both escapement goals. In 2018, the daily early- and late-run escapement during the transition period was initially determined by applying an average stock proportion curve developed from past inseason genetic information (2010-2017). There were 6 genetic sampling events during the traditional peak overlap period in 2018 however; the samples were not analyzed until after the final sample was taken on July 27 (Table 5). Once the samples were analyzed, the new model was applied to the 2018 escapement and the daily proportions for early- and late-run sockeye salmon from June 1 through July 31 were readjusted (Table 6). Figure 6 represents the late run timing into the Chignik River from 2010-2018.

To estimate the amount of early- and late-run sockeye in the commercial harvest, daily commercial catch information was adjusted to the date when the harvested fish would have passed the weir and the appropriate stock composition estimate was applied to harvested fish. Stock-specific harvest estimates were added to daily escapement to create total daily run size estimates.

Sockeye salmon returning to the Chignik River watershed in 2018 were managed to achieve newly established interim escapement objectives by run (Table 1). The new interim objectives were developed by ADF\&G based on historical run timing to ensure achievable goals. The 2018 estimated total Chignik River watershed sockeye salmon escapement (539,697 fish; Table 2) was the lowest final estimated escapement for the Chignik River sockeye salmon run since 1969 (485,144 fish; Pedersen 1969). Escapement for both runs was well below all recent averages
(Table 7). The early run peaked in late June and the late run peaked in late July (Table 6; Figure 7). The early-run escapement ( 263,979 sockeye salmon) lagged behind interim escapement objectives the entire season and did not achieve the early-run BEG range of 350,000-450,000 fish (Table 7; Figure 8). The late-run estimated escapement ( 275,718 sockeye salmon) met the lower bound of the late-run SEG range of 275,000-400,000 fish but did not achieve interim escapement objectives until near the end of August (Tables 1, and 7; Figure 8). The late-run escapement includes a post-weir estimate for September 7-30 (18,793; Table 2).

The late-run Chignik River sockeye salmon IRRG requires 25,000 fish be escaped past the Chignik River weir in August in addition to minimum escapement needs for the month of approximately 73,000 fish (Table 1). This requires that a minimum of 98,000 sockeye salmon escape past the weir in August. The IRRG also requires that 50,000 sockeye salmon be escaped during September. In 2018, the August component of the IRRG was met with approximately 145,136 sockeye salmon (Table 2). The 2018 September IRRG component was not met with an estimated 34,915 sockeye salmon escaping into the Chignik River. The total September Chignik River sockeye salmon estimate includes 6 days of DIDSON estimates (September 1-6; 16,122 fish) and the post weir analysis estimate of (September 7-30) of 18,793 fish.

Total peak aerial survey counts of spawning sockeye salmon in Black Lake tributaries were similar to recent averages (Table 8). Survey conditions were poor during peak aerial survey counts for Chignik Lake, likely reducing the total number of sockeye salmon that were counted. Total peak aerial survey counts of spawning sockeye salmon in the Chignik Lake and its tributaries were well below all recent averages (Table 9).

Sockeye salmon escapements are often documented, via aerial survey, in low numbers (generally fewer than 3,000 fish) in several other CMA streams. Due to small run sizes and limited effort, escapement goals for these streams have not been established (Witteveen et al. 2007).

## Coho Salmon

Coho salmon enter CMA drainages in mid-August and generally continue through November. The 2018 Chignik River coho salmon escapement estimate through September 6 was 64,214 fish, well above recent averages (Table 3). Late season coho salmon stream surveys were not conducted in the CMA in 2018 due to inclement weather in September and departure of ADF\&G staff from Chignik prior to the peak of the coho salmon runs.

Due to late season run timing and limited directed effort, escapement goals for coho salmon have not been established in the CMA (Schaberg et al. 2015).

## Pink Salmon

Pink salmon began entering the Chignik River in late June and peaked in late August with a total escapement of 3,222 fish (Table 3). The 2018 Chignik River pink salmon escapement was well below the recent 5-, 10-, and 20-year average escapements (Table 4).
Escapements into other CMA streams were monitored via aerial surveys. In season, streams that have been historically monitored for pink salmon were surveyed and compared to historical run timing and distribution. Survey conditions were poor much of the season but early surveys in late July indicated that pink salmon returns were likely late or weak and most index streams continued to have low numbers of fish throughout the season. The 2018 overall combined peak escapement estimate for the CMA was approximately 144,627 pink salmon (Table 10) and was
well below all historical averages. The current even-year SEG of 170,000-280,000 pink salmon is composed of 8 index streams in 4 of the 5 districts in the CMA. The 2018 calculated peak escapement, based on aerial surveys of the 8 index streams, did not meet the lower bound of the even-year SEG with 41,900 fish (Table 11). More pink salmon may have been estimated if survey conditions had been better; however, it is likely that the lower bound of the escapement goal would still not have been met.

## Chum Salmon

A limited number of chum salmon return to the Chignik River, mainly in late July and August (Table 3). The 2018 Chignik River chum salmon escapement was 54 fish, which was less than all recent average escapements (Table 4).

Escapements into other CMA streams were monitored via aerial surveys. In season, streams that have been historically monitored for chum salmon were surveyed and compared to historical run timing and distribution. The 2018 overall combined peak escapement estimate for the CMA was 80,454 chum salmon, which was well below all recent averages (Table 12). The current SEG of $45,000-110,000$ is based on 6 index streams located in 4 of the 5 CMA districts. The peak aerial surveys from the index streams were summed and compared to the areawide aggregate SEG for chum salmon (Schaberg et al. 2015). The 2018 CMA chum salmon escapement estimate of 33,400 fish based on the 6 index streams was below the SEG and well below the 10-year average (Table 13). Surveys early in the season indicated local chum salmon stocks were arriving as expected and it is likely that the escapement goal would have been met if there had been better survey conditions.

## 2018 HARVEST INFORMATION

Commercial salmon harvest in the CMA is organized into 3 categories. The first category includes salmon that were commercially harvested but retained for private use (home pack). The second category includes salmon that were harvested and sold as part of ADF\&G's test fishery program. The third category includes salmon commercially harvested and sold within the CMA. Additionally, sockeye salmon harvested under the Cape Igvak and SEDM management plans are reported separately in this report. For allocative purposes, the BOF has determined that specific portions of these harvests are considered bound for the Chignik River.
Salmon harvested under subsistence regulations, in ADF\&G's Chignik Lagoon test fishery or retained as home pack from the commercial fishery, were not included in any of the harvest allocations. All harvest information in this report was calculated from the ADF\&G fish ticket database and supersedes any previously published data. Confidentiality rules prohibit the release of any harvest information by district due to low participation in the 2018 Chignik fishery. A complete summary of 2018 CMA commercial salmon harvest and effort can be found in Table 14.

## Chinook Salmon

No Chinook salmon were harvested during the limited commercial fishing periods in 2018 (Table 15). The most recent 10-year average harvest of Chinook salmon in the CMA is 7,062 fish. Tables 16 and 17 provide historical context and 2018 harvest information regarding Chinook salmon harvest in the CMA.

## Sockeye Salmon

The 2018 CMA sockeye salmon harvest of 128 fish was incidental to the targeted pink and chum salmon fishery during early July in select bays of the CMA. Traditional sockeye salmon harvest areas remained closed the entire season throughout the CMA due to the poor runs. There was no ADF\&G test fishery in 2018 (Table 18). Tables 18 and 19 provide historical context and 2018 harvest information for sockeye salmon in the CMA.

The Cape Igvak and SEDM fisheries were not opened during the allocation period (June 1-July 25) due to very little sockeye salmon harvest in the CMA. Therefore, no sockeye salmon allocatively considered Chignik-bound were harvested as part of the Cape Igvak or SEDM fisheries (Table 20).

The most recent 10-year average for Chignik-bound sockeye salmon harvest is approximately 1.7 million fish, while average escapement into the Chignik River is 772,000 fish (Table 21). The combined harvest and escapement for the most recent 10-year average is approximately 2.4 million fish. The total 2018 Chignik River sockeye salmon run (harvest and escapement) was 539,825 fish, approximately $22 \%$ of the 2008-2017 average annual run (Table 21; Figures 9, 10, and 11).

The 2018 Chignik River early sockeye salmon run was forecasted to be approximately 848,000 fish. The late sockeye salmon run was forecasted to be 901,000 fish. The early run return was approximately 590,000 sockeye salmon below the forecast, whereas the late run was approximately 630,000 fish below the forecast (Table 22).

## Coho Salmon

One coho salmon was harvested in the CMA during the 48-hour fishing period in July (Tables 23 and 24). The most recent 10 -year average harvest of coho salmon in the CMA is 110,927 fish. Tables 23 and 24 provide historical context and 2018 harvest information regarding coho salmon harvest in the CMA.

## Pink Salmon

A total of 6 pink salmon were harvested during the 48-hour fishing period in early July. The even-year average harvest of pink salmon from 2008-2016 is 702,095 fish. Tables 25 and 26 provide historical context and 2018 harvest information regarding pink salmon harvest in the CMA.

## Chum Salmon

A total of 924 chum salmon were harvested from the CMA during the 2018 season. The most recent 10 -year average harvest of chum salmon in the CMA is 252,650 fish. Tables 27 and 28 provide historical context and 2018 harvest information regarding chum salmon harvest in the CMA.

## 2018 COMMERCIAL SALMON FISHERY SUMMARY

Initial sockeye salmon escapement through the Chignik River weir was exceedingly below average and continued to track below interim escapement objectives throughout the 2018 season. As mentioned previously in this report under 2018 Escapement Information, in order to estimate the early- and late-run fish passing the weir in season, ADF\&G applied an average stock proportion curve developed from genetic data collected during the 2010-2017 seasons. The
model from which the curve was developed assumed that early-run fish escape upriver through July 31. Late-run sockeye salmon begin escaping in mid-June and all fish passing the weir beginning August 1 were considered late run. Through July 31, the early run was estimated to be approximately 192,000 fish, far below the final early-run goal. The late-run sockeye salmon escapement was estimated to be approximately 168,000 fish through July 31 and was tracking slightly above the minimum escapement objectives for that time of year.

Genetic samples were collected every 4 or 5 days at the weir from approximately June 26 to July 27. The samples were sent to the genetics lab in Anchorage and analyzed after the final sampling period. Once the samples were analyzed, the new model was applied to the 2018 escapement and the daily proportions for early- and late-run sockeye salmon from June 1 through July 31 were readjusted. The estimated Chignik River early-run sockeye salmon escapement was adjusted to 263,979 fish which was still well below the final escapement goal and all recent averages. The late-run sockeye salmon estimated escapement through July 31 was adjusted to 95,667 fish, dropping the estimated escapement well below escapement objectives. The late-run escapement lagged behind escapement objectives most of the season; however, it did begin meeting the lower bound objectives at the end of August.
Due to the poor escapement and lack of a harvestable surplus of fish, there were no directed sockeye salmon fisheries this season. Areas where sockeye salmon were traditionally harvested remained closed; however, select inner bays in the CMA where pink and chum salmon are typically harvested did open for a short commercial fishing period in July (Figure 12). The 128 sockeye salmon harvested were incidentally harvested during this fishing period. The 2018 total Chignik run including escapement and harvest (593,825 fish; Table 21) was the lowest on record since statehood.

Between July 6 and July 15, ADF\&G may conduct at least one 48-hour fishery in select bays of the Central, Western, and Perryville districts to provide early harvest opportunity on pink and chum salmon (Wilburn 2017). After July 15, management of these areas is based on inseason escapement information. One 48-hour fishery occurred on July 7-8 in portions of Kujulik Bay in the Central District, Dorner, Ivan and Fishrack bays of the Western District, and Humpback and Ivanoff bays of the Perryville District. Very few permit holders made deliveries during this fishing period and low harvest indicated that there were not many fish present (Table 14). Aerial surveys on July 8 confirmed that while chum salmon were beginning to arrive in some areas, pink salmon may have been late or weak. Additional surveys throughout the season confirmed that local pink salmon runs were weak and as a result, no other pink and chum salmon commercial fishing periods occurred.

A second commercial fishing period began on September 3 to target local stocks of coho salmon. Fishermen expressed interest to target coho salmon and had an available market. ADF\&G documented coho salmon beginning to enter some local CMA streams via aerial survey on September 1. Based on this survey, ADF\&G determined that a short fishing period would be appropriate in selected inner bays to provide opportunity on coho salmon and act as a test fishery to further assess the strength of the arriving coho salmon run. There were no deliveries during this fishing period and no further fishing periods were prosecuted in the CMA.

Out of 91 permits issued in the CMA for 2018, a total of 6 permits made deliveries (Table 14). For the first time since statehood, no commercial fishing periods targeting sockeye salmon
occurred during the commercial salmon fishing season in the CMA. A summary of emergency orders outlining the commercial salmon fishery is located in Appendix A.
Salmon were delivered to 3 processors in 2018: Trident Seafoods located in Chignik Bay, Ocean Beauty Seafoods in Alitak, and International Seafoods of Alaska in Kodiak. Processors filleted or headed and gutted the majority of Chignik salmon.

Due to the unprecedented poor returns of the 2018 Chignik River sockeye salmon early run, ADF\&G took emergency order (EO) action under AS 16.05.060 Emergency Orders and reduced fishing time in the regularly scheduled fishing periods of the June South Unimak and Shumagin Islands fishery (Area M). In July, ADF\&G again took action in the post-June fishery (mid-July) by leaving a portion of the "Dolgoi Island" area closed during regularly scheduled fishing periods. Past studies have indicated a strong presence of Chignik-bound sockeye salmon traversing the South Peninsula management area in June and the department determined that EO action was warranted in order to increase the number of sockeye salmon returning to the Chignik Area. The restrictions placed in effect by ADF\&G were to help minimize harvesting of Chignik stocks in order to ensure future sustainability for Chignik Area sockeye salmon. Additionally, in early July, Chignik fishermen petitioned the BOF to take future emergency action in portions of Area M to protect the remainder of the 2018 Chignik River sockeye salmon run. During the Alaska Board of Fisheries Emergency Petitions Meeting in Anchorage on July 17, the BOF declared an emergency and established emergency regulatory action extending the department's existing closures in Area M through early August pending late run interim escapement objectives being met. For further information on actions taken in Area M for the conservation of the Chignik sockeye salmon runs, please refer to Fox et al. (2019).

## Economic Value

In 2018, 6 CMA permit holders made deliveries (Table 29). The exvessel value of the 2018 CMA commercial salmon harvest was about $\$ 3,000$, or approximately $\$ 500$ per active permit holder (Table 29; Figure 14). Over the last 10 years, participation has averaged 66 active permits each year with an average exvessel value per active permit of approximately $\$ 193,000$.

## CHIGNIK LAGOON TEST Fishery

ADF\&G conducts test fisheries in Chignik Lagoon for multiple purposes. The main purpose of the Chignik Lagoon test fisheries is to assess sockeye salmon abundance in Chignik Lagoon during closures. Test fisheries are also used to offset the costs of operations at the Chignik weir (Wilburn 2015). No test fisheries were conducted in 2018.

## SUBSISTENCE SALMON

State subsistence fishing was open for sockeye salmon the entire season in the CMA; however, the Federal Subsistence Board restricted fishing for sockeye salmon to only federally qualified subsistence users with a Social and Cultural Harvest permit from June 22 through July 31 in all federal public waters of the Chignik River Drainage. Subsistence fishing in the Chignik River for sockeye salmon reopened to all state subsistence users beginning August 1.

Beginning July 11, subsistence fishing for Chinook salmon was closed for the season in the Chignik River drainage.

The 2018 CMA subsistence harvest will not be available until after subsistence permits are returned and tabulated in the spring of 2019. Historical subsistence harvests can be found in Table 30.

| 8/19 |  |  | 206,000 |  | 331,000 |
| 8/24 |  |  | 218,000 |  | 340,000 |
| 8/29 |  |  | 223,000 |  | 348,000 |
| 8/30 |  |  | 225,000 |  | 350,000 |
| September |  |  | 275,000 | - | 400,000 |

Escapement Goals

| Black Lake | $350,000-450,000$ |
| :--- | :--- |
| Chignik Lake $^{\mathrm{a}}$ | $275,000-400,000$ |

a The late-run escapement objective includes the late-run sockeye salmon sustainable escapement goal (SEG; 200,000-400,000) plus an additional 75,000 sockeye salmon inriver run goal (IRRG; 25,000 in August and 50,000 in September) to meet lateseason subsistence needs. The IRRG (75,000 fish) is added to the lower bound escapement objectives beginning in August.

Note: Beginning in 2004, estimated total escapement for early-run sockeye salmon was based on Chignik River weir counts through July 4, based on scale pattern analysis studies. After July 4, sockeye salmon through the weir were considered late-run escapement. From 2014-2017, inseason genetic samples were used to determine the apportionment of the two runs during late June and mid-July when the runs overlap instead of the July 4 date. In 2018, an average stock proportion curve developed from inseason genetics data collected from 2010-2017 was used to define the run transition inseason and post season (after July 31) adjustments were made using the inseason genetic samples collect during the 2018 season.
${ }^{a}$ The weir was removed after the completion of the $8 / 18$ count. DIDSON (Dual Identification Sonar) was used to enumerate sockeye salmon escapement through 9/6. A post-weir estimate was produced for 9/7-9/30 using a time series analysis based on the rate of decay of the run (Appendix B).
b The results of genetic samples collected inseason were used to determine the apportionment of the early- and late-run Chignik River sockeye salmon in 2018.

a The Chignik River weir was removed after August 18 due to a high-water event. Beginning August 19 DIDSON sonar units were used to estimate escapement.

Table 4.-Page 2 of 2.
a A video monitoring system was installed at the Chignik weir in 1994.
b No escapement adjustments are made for Chinook salmon that spawn below the weir, or those removed by the sport fishery. Only Chinook salmon larger than approximately 650 mm were enumerated for escapement estimates from 1980 to 1993.
c No reliable escapement (ND) estimates were generated for pink, chum, or coho salmon or Dolly Varden from 1980 to 1996. No post-weir estimates are reported in this table for pink and chum salmon or Dolly Varden.
d Due to early removal of the weir in 2015 (August 20) and 2018 (August 19), post-weir escapement estimates for coho salmon were produced using DIDSON.

Table 5.-Estimates of stock composition, with upper and lower $90 \%$ credibility intervals, and standard deviations for escapement through the Chignik River weir, by sample date, 2010-2018.

Note: The weir was removed after the completion of the $8 / 18$ count. (Dual Identification Sonar) was used to enumerate sockeye salmon escapement through 9/6. A post weir estimate was produced for 9/7-9/30 using a time series analysis based on the rate of decay of the run (Appendix B). The post-weir estimate was 18,793 fish for a total sockeye salmon escapement of 539,697 fish.

Table 7.-Total Chignik River sockeye salmon escapement and escapement goals, based on postseason analysis, by run, 1980-2018.

| Year | Early run | Late run | Total |

| $1998-2016$ | 17,582 | 88,808 | 371,205 | 57,164 | 74,328 | 609,086 |
| $2008-2016$ | 19,753 | 57,110 | 197,980 | 45,760 | 53,584 | 374,187 |
| $2012-2016$ | 6,968 | 38,417 | 119,507 | 35,780 | 25,107 | 225,778 |

Note: All escapement estimates were via peak aerial survey, with the exception of Chignik River, which was included in the Chignik Bay District estimate. No reliable escapement estimates (ND) were available for some years or streams within a year. This table reflects the total peak escapement of 49 streams in the CMA that are monitored for in-season management, not just the 8 index streams used to compute the escapement index.

Table 11.-Estimated Chignik Management Area peak pink salmon combined escapement of index streams, and escapement objectives, 2006-2018.

| Year | Total estimated peak escapement |
| :--- | ---: |
| 2006 | 163,800 |
| 2007 | 384,500 |
| 2008 | 260,800 |

${ }^{\text {a }}$ The Cape Igvak allocation began in 1978. From 1978 to 2002, $80 \%$ of the Cape Igvak sockeye salmon harvest was considered Chignik River-bound. Beginning in 2002, that percentage was changed to $90 \%$.
${ }^{\text {b }}$ Beginning in 1980, 80\% of the SEDM harvest in specific areas during specific times was considered Chignik River-bound.
c Weights of home pack are not reported on fish tickets; therefore, the weights were calculated from the average weight of the commercial harvest for that year.
d Due to a strike by Alaska Peninsula fishermen, foregone harvest of 27,896 sockeye salmon harvested in 2001 was added to the SEDM catch for management purposes; this foregone harvest is not included in this table.

Table 19.- Total annual Chignik Management Area sockeye salmon harvest (including home pack and the ADF\&G test fishery catches), by district, 1980-2018.

a Through 2001, the Cape Igvak and Southeastern District Mainland figures represent $80 \%$ of the total sockeye salmon catch for those areas through July 25, based on the regulations in effect during those years. In 2002 the Alaska Board of Fisheries increased the percentage of sockeye salmon harvest considered Chignik-bound from $80 \%$ to $90 \%$ in the Cape Igvak fishery. The figures reported in this table are the portion of the catches considered Chignik-bound. These figures do not include Chignik test fishery harvests or fish retained for home pack because they are not included in the allocation scheme.
b Beginning in 1978, the Cape Igvak Salmon Management Plan allocated up to $15 \%$ of the total catch of Chignik-bound sockeye salmon to the Cape Igvak fishery.
c Beginning in 1985 the Southeastern District Mainland was allowed an allocation of $6.2 \%$ of the total harvest of Chignikbound sockeye salmon through July 25. Certain areas (which changed frequently) were excluded from the allocation and managed for local (Orzinski Lake) stocks (see regulations from the individual years). After July 25 the entire Southeast District Mainland was managed based on local stock abundance. The allocation level changed to $6.0 \%$ beginning in 1988. Beginning in 1992, the allocation of Chignik-bound sockeye to the Southeastern District Mainland fishery was increased to $7.0 \%$. Prior to the 1996 season, the Alaska Board of Fisheries decreased the allocation from $7.0 \%$ to $6.0 \%$. The allocation was increased from $6.0 \%$ to $7.6 \%$ prior to the 2007 season and was applied to the total sockeye salmon harvested in the CMA during the allocation period instead of Chignik-bound sockeye salmon harvested.
d Includes a foregone harvest of 278,305 sockeye salmon during a Chignik area strike (June 23-July 4).
e Includes a foregone harvest of 208,921 sockeye salmon during a Chignik area strike (June 2-June 25).
f Includes a foregone harvest of 52,131 sockeye salmon during a Chignik area strike (June 16-June 29).
g Includes a foregone harvest of 389,887 sockeye salmon in Chignik during a Chignik area strike (June 16-29), and foregone harvest of 27,896 sockeye salmon in the SEDM during a strike on the South Peninsula (June 14-July 2).
${ }^{h}$ Recent averages (excluding Chignik catch) do not include years in which the Cape Igvak and SEDM remained closed.

a Includes Cape Igvak and SEDM harvests considered Chignik-bound as defined in regulation. However, portions of the harvests from Cape Igvak and SEDM from 1970 to 1979 were not considered Chignik bound by regulation but were included in this table.
b Does not include subsistence-caught fish.
c Includes catches from the Chignik Lagoon test fishery and fish retained for personal use.
d Beginning in 2014, in season genetic samples were collected at the weir to determine the proportion of the early and late run during the overlap period from late June to mid-July instead of the traditional date of July 4. These results were also applied to the harvest numbers using time delays.

Note: No reliable estimates (ND) were available for some years.
a Weights of home pack fish are not reported on fish tickets; therefore, the weights were calculated from the average weight of the commercial harvest for that year.

Table 24.-Chignik Management Area coho salmon harvest (including home pack and the ADF\&G test fishery catches), by district and year, 1980-2018.

a Total value of commercial catch in dollars, by species. Total value does not include home pack or department test fishery.
b Average value of commercial catch in dollars, by species. Average value does not include home pack or department test fishery.
${ }^{\text {c }}$ Includes the number of commercial permits that received income from the harvest. These figures do not include department test fishery harvests.
${ }^{\text {d }}$ Values represent the initial price paid, and do not include any postseason adjustments by any processor. The average 2018 exvessel prices per pound were as follows: sockeye - $\$ 1.43$, coho - $\$ 0.35$, pink - $\$ 0.20$, chum - $\$ 0.43$.

a From 1993-2008 and in 2011, 2014, and 2015 postseason household surveys were conducted to supplement harvest data collected through returned permits. To compensate underestimated harvest due to permits not returned, the average annual harvest for the period 1999-2008 and 2011 reported during postseason surveys was added to harvests from returned permits to estimate the total subsistence harvest for 2009 and 2010, 2012, and 2013.

## APPENDIX A. SUMMARY OF 2018 EMERGENCY ORDERS

Appendix A1.-Summary of the 2018 Chignik Management Area emergency orders.

| E.O. Number | Issued | Effective | Action taken |
| :---: | :---: | :---: | :---: |
| 4-FS-L-1-18 | $\begin{aligned} & \text { 9:15 AM } \\ & 7 / 3 / 2018 \end{aligned}$ | $\begin{aligned} & \text { 4:00 PM } \\ & 7 / 7 / 2018 \end{aligned}$ | Opens specific statistical areas within the CMA to target local pink and chum salmon harvest for 48 hours from 12:01 AM Saturday, July 7, until 11:59 PM Monday, July 10. The areas and statistical codes are as follows; Kujulik Bay (272-51), Ivan Bay (273-71), Fish Rack Bay (273-73), Dorner Bay (273-84, 273-81, 273-82), Humpback Bay (275-51), and Ivanof Bay (275-41), |
| $\begin{aligned} & \text { 4-FS-L-SUB- } \\ & \text { 18-1 } \end{aligned}$ | $\begin{array}{r} \text { 9:15 AM } \\ 7 / 12 / 2018 \end{array}$ | $\begin{aligned} & \text { 12:01 AM } \\ & 7 / 13 / 2018 \end{aligned}$ | Prohibits the retention of Chinook salmon in the state subsistence fishery from 12:01 AM, Friday July 13, until 11:59 PM Monday, December 31. |
| 4-FS-L-2-18 | $\begin{array}{r} \text { 6:15 PM } \\ 8 / 31 / 2018 \end{array}$ | $\begin{array}{r} \text { 12:01 AM } \\ 9 / 3 / 2018 \end{array}$ | Opens specific statistical areas within the CMA to target local coho salmon harvest for 48 hours from 12:01 AM Monday, September 3, until 11:59 PM Tuesday, September 4. The areas and statistical codes are as follows; Amber Bay (272-71), Inner Nakalilok Bay (272-81), Inner Yantarni Bay (272-73), Chiginagak Section (272-91), Kujulik Bay (272-51), Dorner Bay (273-84, 273-81, and 273-82), and Ivanof Bay (275-41). |

# APPENDIX B. 2018 CHIGNIK RIVER SOCKEYE SALMON POST-WEIR ESCAPEMENT ESTIMATE MEMORANDUM 

# MEMORANDUM 

# State of Alaska 

Department of Fish and Game
Westward Region Office

TO: Kevin Schaberg
DATE: September 18, 2018
Regional Finfish Research Coordinator
Commercial Fisheries Division
Region IV- Kodiak
PHONE NO: 907-486-1848

FROM: Heather Finkle SUBJECT: 2018 Chignik post-weir estimate thru
Finfish Research Biologist
September 30
Commercial Fisheries Division
Region IV- Kodiak

The overwhelming majority of Chignik River sockeye salmon escapement is estimated when passing through the Chignik weir, which is operational generally from the end of May to the beginning of September. However, fish continue to escape the system through September, during which time an in-river run goal (IRRG: August goal of 25 thousand fish and September goal of 50 thousand fish) exists supplemental to the sustainable escapement goal of 200-400 thousand fish that extends through September 30 (Schaberg 2015, Witteveen et al. 2007).

Historically, a post-weir estimate has been derived to estimate the sockeye salmon escapement to the Chignik River following the closure of the weir. Typically, a time series analysis generalizing the decay of the run (Chatfield 1985, Hyndman and Athanasopoulos 2014) has been employed for the post-weir analysis to estimate fish passage through September 30. Since 2011, a DIDSON sonar has been employed as an alternate method to count escapement in the event of weir failure or following removal. Although operated concurrently with the weir, DIDSON sonar counts have yet to be compared to the established weir count index. However, for 2018, the Chignik weir was pulled rather early on August 18 because of high water events. Subsequently, DIDSON sonar was used to enumerate fish passage between August 19 and September 6; those counts were
utilized in the post-weir estimate model along with available weir counts.
A Holt time series model, which accounted for autocorrelation, nonstationarity, and exponential trends in the data (Hyndman and Athanasopoulos 2014), estimated a total of 18,793 late-run fish to have escaped upriver from September 7 to September 30 (Figure 1). The model employed late-run data from August 4 to September 6 to represent the decay of the run. No fishing occurred during the period of post-weir estimation. The addition of the post-weir estimate to the run reconstruction yields a total of 34,915 fish escaping the system from September 1 to 30. The post-weir estimate increases the late-run escapement total to 275,719 fish and the total escapement to the Chignik watershed to 539,697 fish.

2018 Chignik sockeye salmon post-weir escapement estimate
