

# **REGION IV RESEARCH UPDATE**

Alaska Board of Game Meeting

16–23 February 2018

Dillingham, AK

# SUMMARY OF RESEARCH PROGRAM

## Research Staff:

Bill Collins – Wildlife Physiologist

Nick Demma – Wildlife Biologist (Bear / Wolf)

Kim Jones – Wildlife Biologist (Predator / Prey)

Kassidy Colson – Wildlife Biologist (Moose / Furbearers)

Meg Inokuma – Biometrician

Vacant – Caribou Biologist

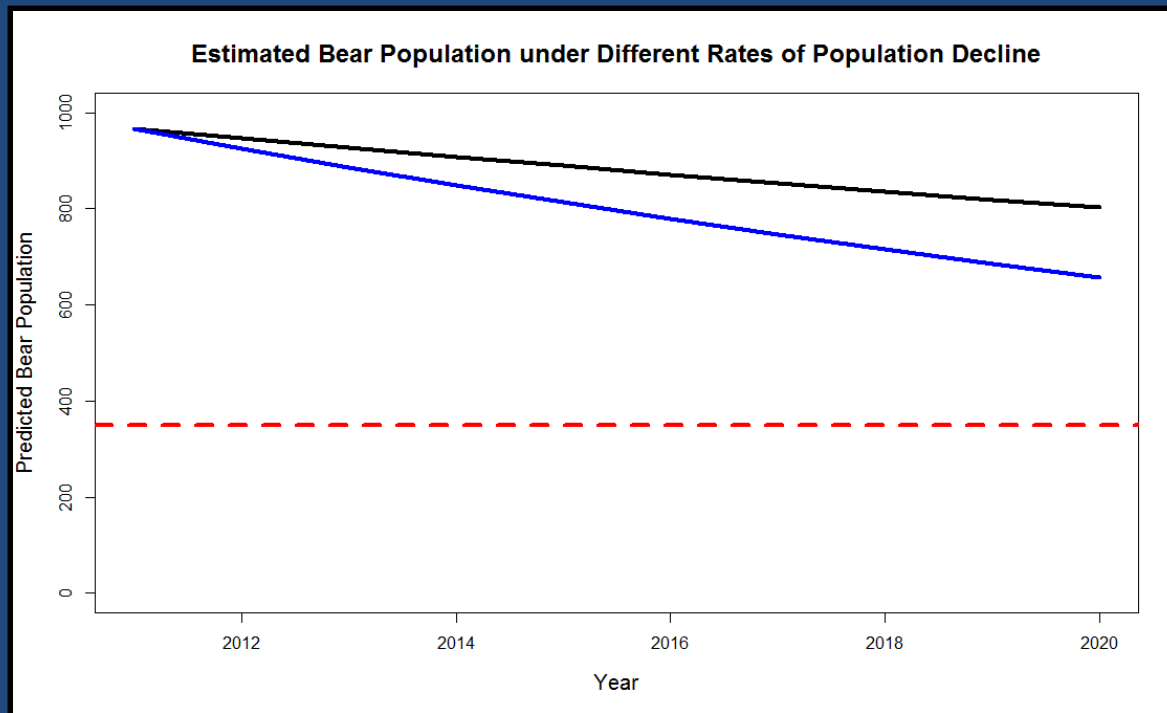

# STATEWIDE

# DIET/NUTRITION LAB

- ADF&G staff and collaborators have developed novel methods for determining diet and measuring habitat quality
- Application limited by lack of staff and laboratory space
- Funding to hire a LTNP has been acquired
- Negotiating with UAF Matanuska Farm for lease of unused lab and office space
- Lease will include office and necropsy lab for new Wildlife Capture Veterinarian and Veterinary Technician

- BOG defined population objective = 350
- Bears collared and monitored for survival and reproduction in Unit 13A from 2006 – 2011
- Capture-mark-resight survey conducted in 2011
- Density = 16 independent bears / 1,000km<sup>2</sup>
- Projected abundance = 966 independent bears
- Testa (1998) estimated density at 21.3 / 1,000km<sup>2</sup>
  - Projected abundance = 1,290

- Change in density indicates annual decline of 2%
- Analysis of vital rate data from collared bears indicates a annual population decline of 4.2%
  - Harvest and reproductive rates were found to be high

# GMU 13

177,202 CARIBOU GPS  
locations collected

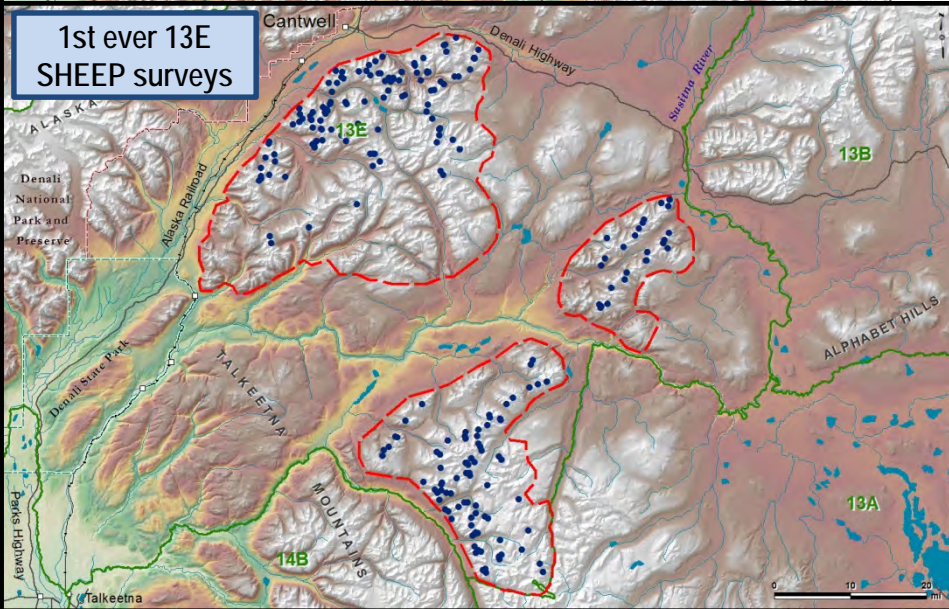

# WATANA

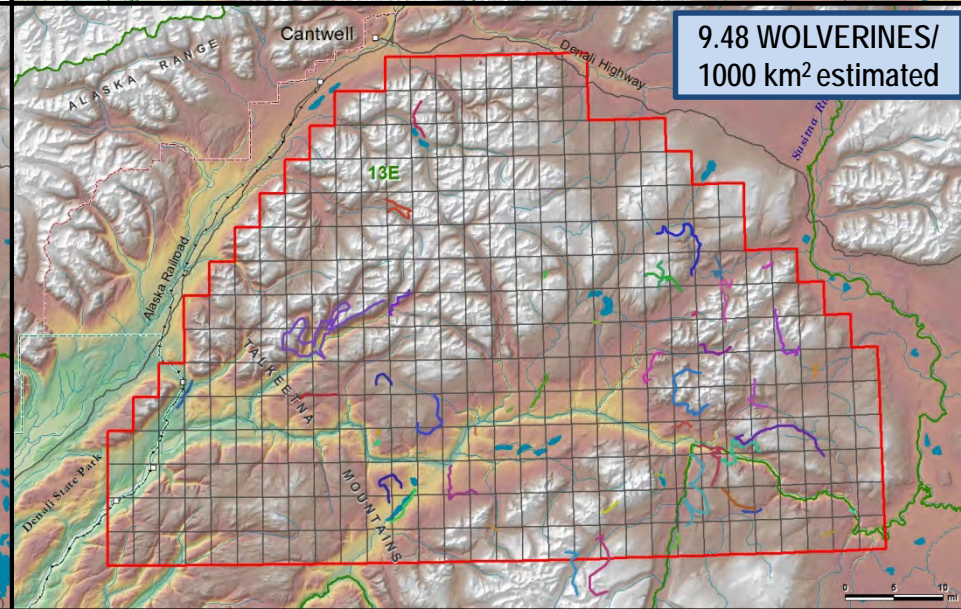

14,156 MOOSE  
locations collected

1st ever 13E  
SHEEP surveys

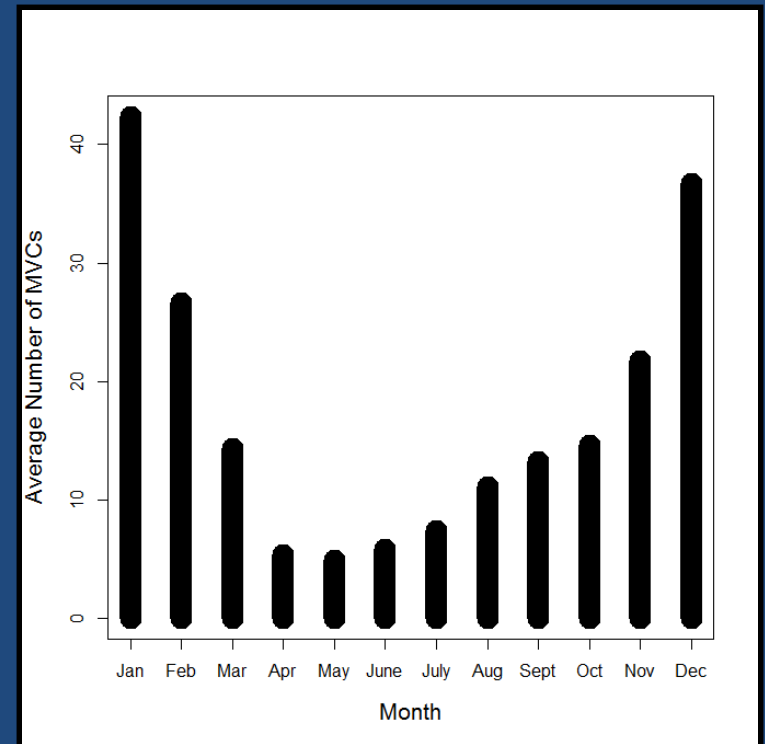

9.48 WOLVERINES/  
1000 km<sup>2</sup> estimated

## Moose-Vehicle Collisions in the Mat-Su:

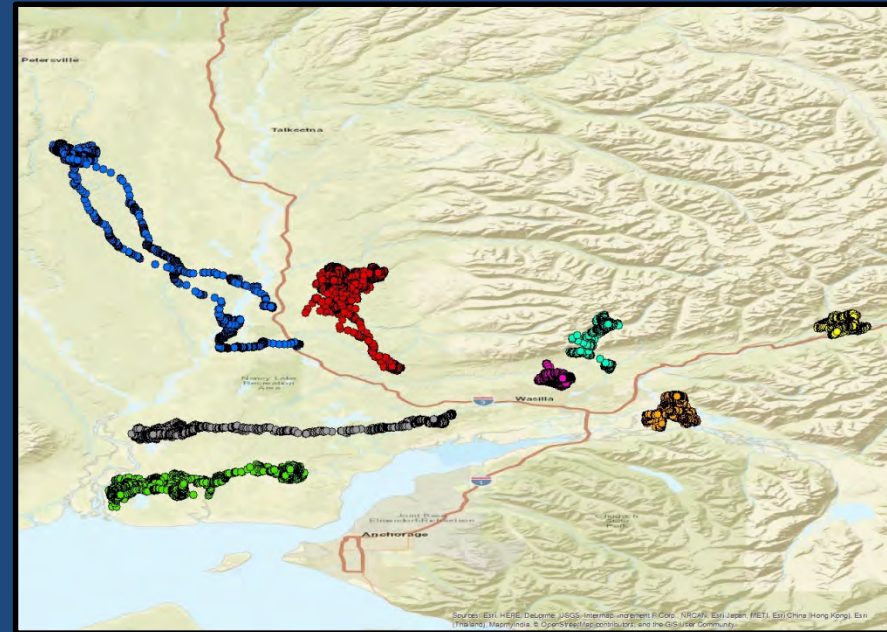

- Over 300 moose collisions annually on Mat-Su roads
- DOTPF estimates each collision costs >\$30,000
- Studying characteristics of moose collision sites

## Moose-Vehicle Collisions in the Mat-Su:

- GPS collars on 60 moose throughout the Valley
- Hourly locations to gain understanding of movement patterns
- 5-minute locations when near major roads

## Summary of ongoing/planned research

- Began Spring 2017
- Objectives:
  - Where is the population nutritionally?
  - What is the overall population trajectory?
  - Where are reasonable treatment areas?
- Early indications of nutritionally robust population.
- Following calf and adult survivorship forward – preliminarily poor.

## Objectives:

- Determine territories and seasonal pack sizes of wolves in the MCH WCA
- Document demographic rates (survival, dispersal, productivity)

## Preliminary Findings (2017):

| Pack        | GPS Home Range (mi <sup>2</sup> ) | Spring Pack Size | Fall Pack Size |
|-------------|-----------------------------------|------------------|----------------|
| Iowithla    | 880*                              | 10               | 12             |
| Klutuk      | 777                               | 2                | 6              |
| Koktuli     | 1520                              | 2                | 2              |
| Old Man     | 2032                              | 9                | 14             |
| Supply Lake | 675                               | 9                | 9              |
| <b>mean</b> | <b>1177</b>                       | <b>6</b>         | <b>9</b>       |

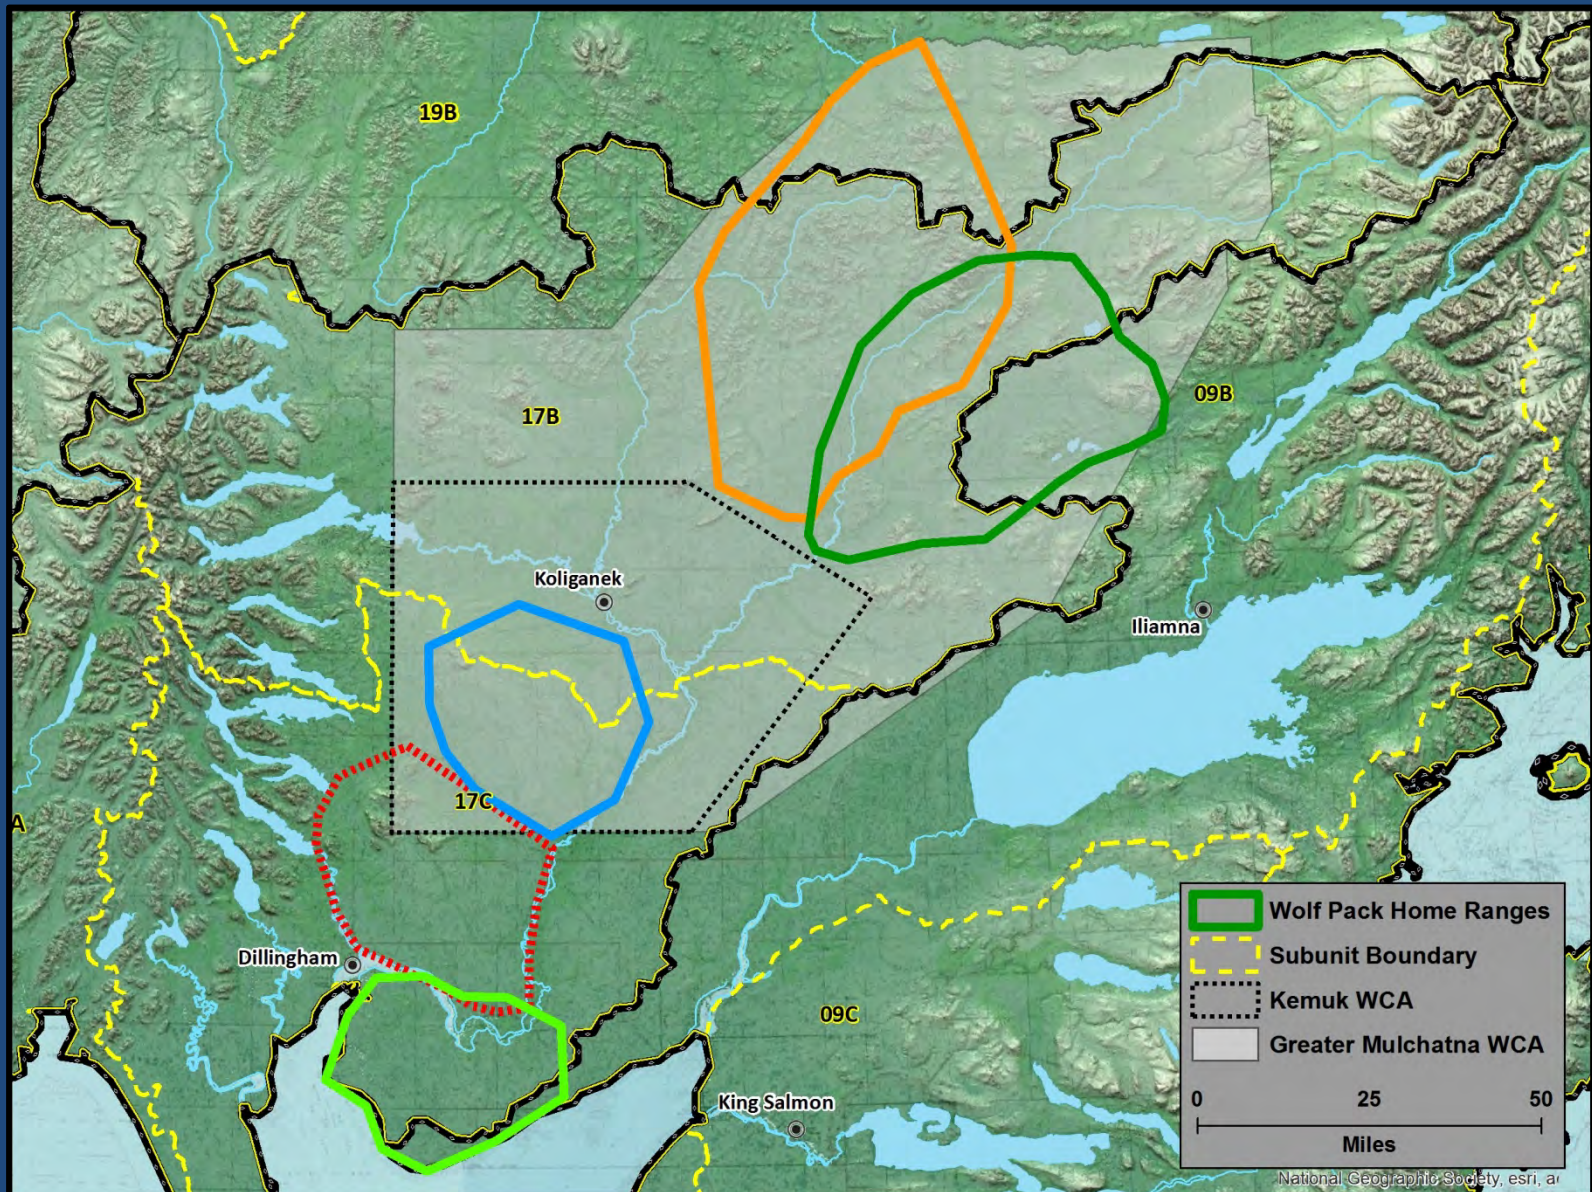

| Minimum Wolf Density | Total Wolves (packs) | Wolves/ 1000 mi <sup>2</sup> | Wolves/ 1000 km <sup>2</sup> |
|----------------------|----------------------|------------------------------|------------------------------|
| Spring 2017          | 32                   | 5.7                          | 2.2                          |
| Fall 2017            | 43                   | 7.7                          | 3.0                          |
